royal, frequently amount to that number. After the seventh year he is said to be croched, or palmed, or crowned, according to the number of branches composing the sur-royal. The female is a "calf" in the first year, a "brocket's sister" in the second and third, and ever afterward, a "hind."

See DEER, and consult authorities there cited.

Red Eagle, Order of the. See ORDERS, ROYAL.

Red-eyed Vireo. See VIREO.

Red Game, or Grouse. See GROUSE.

Red Gum-tree, one of the Australian Eucalypti (*Eucalyptus resinifera*), yielding a gum-resin valued for medicinal uses. (See EUCALYPTUS.) Also the North American liquidambar (q.v.).

Red Horse, a fish. See SUCKER.

Red Jacket, American Indian, chief of the Senecas: b. Old Castle on Seneca Lake, about 1751; d. Seneca Reservation 30 Jan. 1830. His Indian name was Sagoyewatha; he was called Red Jacket on account of the scarlet jacket he always wore, which had been given him by a British officer. He was one of his tribe who served with the British during the Revolutionary War; and was noted as an orator. He became widely known through his attitude toward the treaty of Fort Stanwix in 1784; a council had been called to negotiate between the United States and the Six Nations for the cession of lands, and on the occasion he spoke eloquently against the proposed treaty, but without avail. It was shortly after this that he was elected chief of the Senecas. In 1792 on the occasion of the signing of a treaty of peace between the United States and the Six Nations, Red Jacket had an interview with General Washington, who gave him a silver medal which he always wore afterward. In 1810 he gave information to the agent of the government of the attempt made by Tecumseh to draw the Senecas into the western combination; and in the war with England of 1812 he offered the service of his tribe to the United States, and proved his bravery in several skirmishes. The latter years of his life were passed on the Seneca Reservation; he became very intemperate, and was at one time deposed from the chieftainship on that account. He always opposed the advance of civilization, the missionaries, and the work of education among his people. Consult the 'Life' by W. L. Stone.

Red Jacket, Mich., village in Houghton County; on the Chicago, M. & St. P., the Chicago & N., the Mineral Range, and the Copper Range R.R.'s; about 15 miles north of Houghton. It is in the famous copper region in northern Michigan, near Lake Superior. Its industries are connected with the mining of copper and preparing it for market. Pop. (1890) 3,073; (1900) 4,668.

Red Line Map, a map which attracted considerable interest about the time of the dispute between the United States and England over the boundary line between Canada and Maine. It was made by the Frenchman D'Anville in 1746. It had been sent to Vergennes, the French minister, by Franklin in 1782, and was discovered among the Paris archives by

RED MEN — RED RIVER CAMPAIGN

Jared Sparks. A strong red line drawn near the ridge, in which the Kennebec and Penobscot rivers rise, more than favored the English claims, respecting the northeast boundary of the United States. Sparks sent it to Webster, then Secretary of State, who was anxious lest the English should hear of it. It was used in a secret session of the Senate, and with the Maine commissioners to induce a ratification of the treaty, and was afterward made a ground of reproach against Webster by opponents of the treaty.

Red Men, Improved Order of. See IMPROVED ORDER OF RED MEN.

Red Oak, Iowa, city, county-seat of Montgomery County; on the Nishnabotona River, and on the Chicago, Burlington & Quincy railroad; about 48 miles southeast of Council Bluff and 38 miles east of the Missouri River. It was founded in 1857. It is in a fertile agricultural and stock-raising region; and its industries are connected chiefly with farm products. The chief industrial establishments are flour mills, machine shops, creameries, lumber and brick yards, and stock yards. The city has 13 churches, six school houses, county court-house, municipal buildings, and several good business blocks. The three banks have a combined capital of \$200,000. Pop. (1890) 3,321; (1900) 4,355.

Red River, a large river of the United States, the southernmost of the great tributaries of the Mississippi River. Its headwaters are in the northwestern part of Texas, on the eastern edge of the Llano Estacado, and it flows east-southeast, forming the boundary between Texas and the Indian Territory and the northeastern boundary of Texas, entering Arkansas at the southwest corner of the State. After entering Arkansas it turns south and pursues an exceedingly irregular course to Shreveport, La., where it again takes a southeast course to Avozelles County, making a large northern curve in crossing this county, and entering the Mississippi River opposite the southwest corner of the State of Mississippi. The mouth of the Red River is about 340 miles from the mouth of the Mississippi River. The whole course is nearly 2,000 miles. The chief tributaries are the Washita, which joins it in Louisiana; and the False Washita and the Kiamich, both of which it receives in the Indian Territory. Much of its course is through rich prairies, with red soil which colors the water. About 100 miles above Natchitoches, which lies 100 miles above the mouth of the stream, commences a swampy expansion of the river called the Raft, 70 miles long and 20 miles to 30 miles wide, produced by the river dividing into a number of channels, sometimes shallow, which have been obstructed by fallen trees and other matter brought down by the stream. At great expense this obstruction has been cleared away so far as to admit the passage of steamboats. About four miles above Natchitoches the various channels again unite, soon, however, again to separate into numerous creeks and bayous. Above Shreveport was another such Raft, about 32 miles in length. In 1873 a channel was cut through, making this part of the river navigable, but constant care is exercised in removing the floating timber so as to keep the stream open.

In the upper part of its course it flows through lofty cañons whose perpendicular sides are from 300 to 800 feet in height. After leaving the cañons it enters the sandy lands, where the waters extend out to a shallow stream from 500 to 3,000 feet in width. Then as it enters the wooded country the stream becomes sluggish and spreads out for miles.

A peculiarity of the lower course of the river is the bayous which it sends out. Some of the bayous return to the main stream and others flow directly to the Gulf of Mexico. The Atchafalaya River originally left the Mississippi at a great bend below the mouth of the Red River; but the Mississippi has cut across the bend, forming Turnbull Island, and here the Red occupies the channel once the Mississippi, and flows south of the island, so that the head of the Atchafalaya is now in the Red River, from which it flows south to the Gulf. The Mississippi receives the flood much earlier than the Red River, and at that time, the Mississippi flood waters flow back past Turnbull Island and down the Atchafalaya. The flood plain of the Red River in Louisiana extends along the river until it is merged into the flood plain of the Mississippi at the mouth of the Black River. This plain is from 10 to 20 miles wide, and is known as the Red River bottoms. The plain is below the level of the river and is protected by levees. The river bed above Natchitoches has changed. Many years ago the river left the old bed and cut a new way for itself, a channel about 20 miles long. The new channel is called Bon Dieu River and the old channel is called Cane River. The government is improving the navigation of the Red River. Engineers are working to force all the waters of the Red River into the Mississippi; thus cutting off Atchafalaya. The river is navigable for nearly 1,300 miles, and with its tributaries, over 2,000 miles. Small steamers can ascend almost to the Texas boundary at high water, and to Shreveport at all seasons except when the water is very low. Consult: Marcy, 'Exploration of the Red River of Louisiana.'

Red River, or Song-Koi, a river of Tongking, formed by the junction of the Leteen and Song-shai, the former rising in the Yun-nan province of China, the latter in Laos. It flows southeast, passes Hanoi, and after a course of about 700 miles falls by several mouths into the Gulf of Tongking. The river is navigable to Lao-kai, on the border of China and Tongking and along it the French are developing a trade with the Chinese.

Red River Campaign. In 1864 Gen. Banks, to reduce Texas, asked for reinforcements in order to take in rear the Confederate works at Galveston and the mouth of the Brazos; but Halleck advised operating by way of the Red River, capturing the Confederate depot and dockyard at Shreveport, and repossessing western Louisiana and Texas at a blow. The Mississippi squadron under Porter was to co-operate; the army must be back for the trans-Mississippi operations of spring and summer; but no movement could be made till the spring rains had raised the Red, with only four feet at low water and full of obstructions. The fleet left Vicksburg 10 March, and landed A. J. Smith's troops at Simsport on the 13th; Gen.

RED RIVER OF THE NORTH—RED SEA

Franklin had already come up and driven Gen. Dick Taylor from Fort De Russey guarding the stream; the fleet passed up without opposition; and on the 15th and 16th the forces met at Alexandria. But the Union movements were difficult of co-ordination; Banks did not arrive till the 26th, the rest of Franklin's corps on the 28th. Meantime the Confederates had strongly fortified Shreveport and placed several gunboats there. Banks, with Franklin, went by land to Natchitoches, routing a Confederate force at Cane River on the 28th; Smith's command went by the river in transports, to Grand Ecore, four miles below, arriving 3 April, the day after Banks. On the 8th and 9th Banks advanced by a road away from the river; the Confederates had laid a V-shaped ambush for him, and his command of 8,000 men was utterly routed, and would have been annihilated but for reinforcements from Franklin, 2,000 being killed or wounded (battle of Mansfield). Banks retreated; the next day the Confederates advanced, but were met by a counter-ambush of Franklin's, and one wing of their army was driven back with heavy loss. But the other wing was so successful that the Federals retreated that night and hurried on to Grand Ecore and finally to Alexandria, abandoning the campaign. Meantime the fleet was caught in the falling water of the Red, and would have fallen into the hands of the Confederates but for the engineering skill and resolution of Lieut.-Col. Joseph Bailey, who built a dam of stones and logs, which raised the river and floated all the vessels down with a narrow escape from destruction.

Banks' army in this campaign numbered 31,303; but after detaching two divisions sent to different points, he had a marching column of 25,736 officers and men of all arms. His losses, including those lost on the retreat from Alexandria, were 454 killed, 2,101 wounded, and 2,600 captured or missing, a total of 5,244. Taylor's Confederate army numbered 11,000, and its total losses in the campaign were 3,976 in killed, wounded, and missing. See SABINE CROSS ROADS.

JOSEPH T. DERRY,
Author of 'History of Georgia.'

Red River of the North, a stream which has its source among the lakes in the west central part of Minnesota. It first flows south and southwest, then west to the boundary between Minnesota and North Dakota, where it turns north and forms the boundary between the States mentioned. It enters Canada in the province of Manitoba and flows into Lake Winnipeg. Its source is about 1,600 feet above sea-level and its mouth 710 feet. It is nearly 700 miles long, the greater part of its course is in the United States. Its drainage area is about 43,500 square miles, three fourths of which is in the United States. It is navigable almost to the source. The river and its tributaries have in many parts of the plain cut channels through the clay from 20 to 30 feet deep. The Red River is connected with the Mississippi through its southern branch, Lake Traverse, and the Minnesota River. At high water small steamers can pass from the Red River to the Mississippi. It is connected with Hudson Bay by means of Lake Winnipeg. A number of small rivers enter the Red River from Minnesota and North Dakota. The largest tributaries from North

Dakota are Sheyenne and Pembina. The latter river has its rise in Manitoba. The chief tributary it receives in Manitoba is Assiniboine.

The Red River flows through a productive agricultural region, famous for the quantity and quality of its wheat. The greater part of the basin of this river has been twice submerged beneath the sea, and it was covered with an extensive glacial drift which left an immense lake, now called Lake Agassiz (q.v.), that had an outlet to the Mississippi River. The beaches are still well defined, even those showing the gradual contraction of the lake. The lakes of Manitoba are the remains of this vast lake. The deposits made by means of ice and water have made the Red River Valley an exceedingly fertile region.

Red River Settlement, Canada, founded in 1812 by the Earl of Selkirk, on the banks of the Red River, and since 1870 forming part of the province of Manitoba (q.v.).

Red Rover, *The*, a sea tale by James Fenimore Cooper, published in 1828.

Red Russians. See RUTHENIANS.

Red Sandstone, an obsolete term in stratigraphical geology, used to designate a group of formations of which a red sandstone of various shades was characteristic. These sandstones, however, were later found to belong to two series, a lower one, the Old Red Sandstone (q.v.), now generally known as Devonian, and an upper one, the New Red Sandstone (q.v.), separated from each other by the formations of the Carboniferous Period (q.v.).

Red Scale, an insect affecting the orange (q.v.). See also SCALE-INSECTS.

Red Sea, or **Arabian Gulf** (ancient, *Mare Rubrum*, *Mare Erythraum*, or *Sinus Arabicus*; Arabic, *Bahr-el-Hejaz*), a branch of the Indian Ocean, extending from the Strait of Bab-el-Mandeb, in a north-northwest direction between Arabia on the east, and Abyssinia, Nubia, and Egypt on the west, and connected with the Mediterranean on the north by the canal, about 100 miles long, across the Isthmus of Suez. The Red Sea is a comparatively narrow expanse, 1,450 miles long with a maximum breadth on the tropic of Cancer of 200 miles and a general average of about 180 miles, but diminishing gradually at its south and north extremities; at the former, across the strait it has a width of only 14½ miles, further subdivided by the island of Perim into two channels, a larger on the east, of 11 miles, and a less on the west, of 1½ miles, and forking at the latter into two branches, the one of which, forming the Gulf of Akaba, penetrates north by east into Arabia for about 100 miles, with an average breadth of about 15 miles; while the other, forming the Gulf of Suez, follows the general direction of the sea, and penetrates between Arabia and Egypt for about 200 miles, with an average breadth of about 20 miles. In the fork between these two branches is the celebrated Mount Sinai, or Jebel Musa (Mount of Moses). To the Biblical student the Red Sea possesses considerable interest, from the account of its miraculous passage by the children of Israel when journeying from Egypt. The place at which they crossed the sea was the Gulf of Suez at its northern extremity, but opinions differ as to the exact point of transit,

RED SHIRTS—RED SUNSETS

some maintaining that it was in the neighborhood of the town of Suez, and others that it was about 18 miles farther south, at the mouth of the Wady Tuarik.

The climate is tropical and depressing; both shores of the Red Sea east and west consist generally of a low tract, mostly sandy, though sometimes swampy, varying in width from 10 to 30 miles, and suddenly terminated by the abutments of a lofty table-land of 3,000 feet to 6,000 feet high. The Red Sea may thus be considered as occupying the bottom of an immense longitudinal valley, which probably at one time extended between the table-lands without interruption, but has since been partially filled up by coral-workings, which, extending in parallel lines at a short distance from either coast, have subdivided the sea into three different channels, and have also studded its shores with numerous small islands. In the main channel the depth reaches in one place 1,054 fathoms, but diminishes toward the extremities, where the depth in general does not exceed from 40 to 50 fathoms.

In the Gulf of Suez, which in earlier times is supposed to have extended considerably farther north, this depth gradually decreases to 30 fathoms, and still continues to shoal, till at the harbor of Suez it amounts to only three fathoms; in the Gulf of Akaba, on the contrary, the depth of the main channel is fully maintained, and in some places even exceeded. The currents of the Red Sea are the result of prevailing winds. These winds, whether proceeding either directly north or south, affect only the main body of the sea, and leave a considerable belt along the coasts subject to alternations of land and sea breezes, and not unfrequently to sudden squalls. The chief dangers to navigation arise from the number of shallow reefs, of the presence of which no intimation is given, as the sea never breaks upon them. This absence of breakers is accounted for by the porous nature of the coral, which offers so little resistance that the sea diffuses through it without commotion, as if it were passing through a sieve. The principal harbors of the Red Sea are, on the African coast, Suez, Kosseir, Suakin, and Massowa; and on the Arabian coast, Jedda (the port of Mecca), Hodeida, and Mocha. The trade from shore to shore is not of much importance, consisting chiefly of the transport of pilgrims and some grain from Egypt; but the trade up and down the sea, between Europe and the East Indies, has become very large since the construction of the great ship canal across the Isthmus of Suez.

A telegraphic cable enters the Red Sea at Suez, passes down to Kosseir on its western shore, thence to Suakin on the same side, about lat. 19° 10' N., and then proceeds in a south-southeastern direction close to the island of Perim, and out into the Indian Ocean by the Strait of Bab-el-Mandeb, and arrives at Aden (q.v.).

Red Shirts, the name given to an organization in North Carolina, whose object was to establish and maintain white supremacy in that State, and keep the negroes under. It flourished in the reconstruction period after the Civil War. The members wore red shirts.

Red-shouldered Hawk, a large American buzzard-hawk (*Buteo lineatus*), known popu-

larly as one of the hen-hawks (q.v.), and common over most of North America; but western examples differ from the eastern ones and are called the red-bellied hawk (variety *elegans*). It is most numerous south of the Great Lakes in winter, by reason of the accession of northern migrants. It is of large size and distinguished by the rufous tinge of the head, neck, and shoulders, and plumage generally, the breast with shaft-streaks of blackish, and the tail clear brownish-black, crossed with six sharply defined narrow bands of white. The young are darker and more obscurely marked. The habits of this bird are much like those of its congeners, the red-tail, and broadwing. They may be seen at all seasons "sweeping in graceful curves over the country, rising and falling in spirals, unless after noting prey, when they sometimes dart down hundreds of yards in a very few seconds. Although they feed much on birds and rabbits, and are frequent visitors to the farmyard, they seem to have a special predilection for squirrels." They make their nests of sticks in the tops of tall trees, and very early in the spring four or five large, globular, heavily blotched eggs, are laid. Consult Fisher, 'Hawks and Owls of the United States' (1893).

Red Snapper, a fish. See SNAPPER.

Red Snow, the color of which is caused by minute organisms, vegetable or animal. Aristotle hinted at its existence; Saussure in 1760 discovered it on the St. Bernard, and Capt. Ross in 1819 brought specimens from the Arctic regions. He had found eight miles of cliffs, 600 feet high, colored by it, in many places to the depth of 12 feet, where the rock was reached. Capt. Parry and other Arctic explorers have since met with it abundantly.

Red Spider, a small, scarlet web-spinning mite (*Tetranychus telarius*), which damage the leaves of plants in greenhouses. They should be killed off by a kerosene emulsion spray.

Red Sorrel. See HIBISCUS.

Red Stone, Old Fort, a Pennsylvania structure which figured in the struggle between the French and English for mastery in the Ohio region. It was first a storehouse of the Ohio Company, was a rendezvous for the English when they gathered to advance against the French in 1754, and was burned by the French later in the conflict. At its ruins the leaders of the Whiskey Insurrection held a meeting in August 1794 to plan opposition to the whiskey tax.

Red Sunsets, brilliant phenomena which attracted attention in North America and other parts of the globe in the autumn of 1883 and for several succeeding months. A vivid red glow suffused the entire western sky, remaining for upward of an hour, when it would slowly fade away. This strange sight was first noticed in India, where, it is said, the sun assumed a distinct greenish tinge on nearing the horizon. In striving to account for these strange manifestations a number of solutions were offered, but the theory that met with greatest acceptance was that they emanated from volcanic dust and gaseous matter vomited by Krakatoa, in Sunda Straits. Calculations demonstrated the fact that the manifestations of the red glow coincided with the course which such vapors

would take on being wafted away by winds.

Red Tape, a term applied to unnecessary routine and formality in official affairs. It is derived from the fact that official documents were bound together by red ribbons or tapes. Dickens in 'Little Dorrit,' and Mark Twain, in one of his humorous sketches, have illustrated the working of red tape.

Red Water, (1) a disease of cattle. See RINDERPEST. (2) A marine worm of flagellate protozoa, class *Mastigophora*, order *Dinoflagellata*, infecting harbor waters, destroying fish and molluscs. Varies in color from yellow to reddish brown and is so called as it turns the water red when present.

Red Wing, Minn., city, county-seat of Goodhue County; on the Mississippi River, at the head of Lake Pepin, and on the Chicago, Great Western, the Chicago, M. & St. P., and the Chicago & N. R.R.'s; about 40 miles southeast of Saint Paul. It was settled in 1853, incorporated in 1854, and chartered in 1864. It is in a productive agricultural region in which are deposits of fire-clay. Red Wing is the commercial and industrial centre for a large part of Goodhue and Dakota counties. The chief manufacturing establishments are sewer-pipe works which employ about 450 persons; furniture factories, about 250 employees; lumber mills, 140 employees; stoneware works, 120; hat factory, 40; other manufactories, with about 130 employees. The prominent public buildings are the churches, schools, and several business blocks. The educational institutions are a State training school, Red Wing Seminary, Hague Synod Theological School, Lutheran Ladies' Seminary, high school, public and parish schools, a public library, and private school libraries. There are two hospitals. The three banks have a combined capital and surplus of \$375,000. The government is vested in a mayor and a council of nine members, elected biennially. Pop. (1890) 6,294; (1900) 7,525.

JOHN A. PARDEE.

Editor, 'Goodhue County News.'

Redan, a fortified work having two faces forming a salient angle in the direction from which an attack may be expected. It is open at the gorge. A double redan has a re-entering angle for mutual defense. The redan is the simplest field work, and is used for defending the avenues of approach to a village, bridge, or defile. In front of another field work, it is called a *flèche*. When flanks are added to the faces, the work becomes a detached bastion or lunette. The redan at Sebastopol in the Crimean war was the scene of stubborn conflict between the Russians and the English.

Redbird. See CARDINAL GROSBEEK.

Redbreast, or **Robin Redbreast**, a familiar European warbler (*Erythacus rubecula*), which by its familiar habits has endeared itself to children, and has caused it to be protected and welcomed more than any other bird. The red breast of the male is the distinguishing feature of the species, but the females have duller colors. In Great Britain the redbreast is a permanent resident, but in more northern countries it is migratory, flying southward in winter. It also occurs in Asia Minor and in North Africa. The nest is made of moss and leaves,

and is lined internally with feathers. The eggs number five or six, and are white, spotted with pale brown.

These birds, in winter especially, become very bold and confident in habits, approaching doors and windows without fear, and soon learning even to know the hand which deals out crumbs and scraps of food to them during the inclement season. On the approach of the milder spring the redbreast returns to its native haunts and wilder state. During the breeding season these birds are very pugnacious, and they may attack and drive away all the smaller birds from the vicinity of the nest. The food in spring consists chiefly of insects, while in autumn fruits and seeds constitute the dietary. The song is sweet, but not specially remarkable, and continues during spring, summer, and autumn, often in rainy weather. In Germany it is termed *Thomas Gierdet*; and in Norway, *Peter Ronsnød*.

Redbuck. See DUIKER-BOK.

Redbud, a tree. See CERCIS.

Redcap, a variety of Hamburg fowls. See POULTRY.

Redding, Cal., city, county-seat of Shasta County; on the Sacramento River, and on the Southern Pacific railroad; about 172 miles north of Sacramento. It is in a mining and lumbering region, in which there are some excellent farms in the fertile valleys. The chief industrial establishments are lumber mills, machine shops, foundries, and tool shops. The shipment trade is chiefly in lumber and minerals. It has a well-built court house and a sanatorium. Pop. (1890) 182; (1900) 2,946.

Redemp'tion, in Christian theology, the liberation of sinners from the penalties of the violated divine law; it is effected through the expiating vicarious sacrifice of Christ upon the cross. In law, the freeing of an estate from mortgage, or the taking back of mortgaged property upon fulfilling the terms or conditions on which it was conveyed to the mortgagee. See EQUITY OF REDEMPTION.

Redemp'tioners, or **Indentured Servants**, emigrants to the American colonies who sold their services to planters or others for a term of years—four, five, or seven, according to the contract—after the completion of which they acquired their liberty with a grant of land. There were redemptioners in the first colony founded in Virginia; the system was introduced in Massachusetts in 1631 and later in Maryland, New York, Connecticut, and Pennsylvania. With these indentured servants were brought in many persons who came not of their free will but were kidnapped and held in servitude. See VILLEINS.

Redemptionists. See TRINITARIANS.

Redemptoris'tine Nuns, or **Order of the Most Holy Redeemer**, a religious order of women in the Roman Catholic Church, founded in 1732 by St. Alfonso de Liguori. They are strictly cloistered, leading the contemplative life, and by their prayers assisting the missionary priests of the order of Redemptorists (q.v.); they are subject to the jurisdiction of the ordinary of their place of residence.

Redemp'torists, members of the Congregation of the Most Holy Redeemer, an institute

of missionary priests in the Roman Catholic Church, founded in 1732 by St. Alfonso de Liguori; in some countries they are known as Liguorians. The institute received the approval of Benedict XIV. in 1749. The members, in addition to the three perpetual vows of poverty, chastity, and obedience common to all monastic and semi-monastic bodies, bind themselves by a vow of perseverance in the institute until death: by their vow of poverty they are bound to refuse all church benefices, offices, and dignities outside of their congregation. Their main occupation is the apostolic ministry in conducting "retreats" and "missions" to all classes, with preference for such as are most neglected or who come least under the ordinary ministrations of the Church. The Congregation has establishments in various countries of continental Europe and many in the British Isles. Their first house in the United States was founded in 1832 at Detroit: they have now houses in many of the principal cities.

Redeye, the name of two or more common fresh-water fishes: (1) the rockbass or goggle-eye (*Ambloplites rupestris*) (see BASS); (2) in England the rudd, a reddish roach-like fish (*Leuciscus erythrophthalmus*), sometimes two pounds in weight, and highly esteemed by anglers both in Great Britain and on the Continent.

Redfield, Isaac Fletcher, American jurist: b. Wethersfield, Vt., 10 April 1804; d. Charlestown, Mass., 23 March 1876. He was graduated from Dartmouth College in 1825, admitted to the bar and engaged in law practice. He was attorney-general for Orleans County, Vt., in 1832-5, judge of the Vermont supreme court in 1835-52, chief justice in 1852-60, and in 1857-61 occupied the chair of jurisprudence at Dartmouth. He removed to Boston in 1861, and in 1867-9 was special counsel in Europe for the United States. He was editor for New England of the 'American Law Register' and published: 'Law of Railways' (1857); 'Law of Wills' (1864-70); 'Leading American Railway Cases' (1870); etc.

Redfield, William Charles, American scientist: b. Middletown, Conn., 25 March 1789; d. New York 12 Feb. 1857. In 1803 he was apprenticed to a mechanic at Upper Middletown (now Cromwell), in 1811 set up for himself at Middletown as a mechanic and small merchant, and in 1821 began his study of the subject of Atlantic gales by observations of the region in eastern Connecticut and western Massachusetts devastated by the storm of 3 September, long known as the "great September gale." By his investigation of the course and direction of prostrated objects, he became convinced that the storm was a progressive whirlwind. The perfecting of his theory of storms became his chief object. In 1831 he began the publication in the 'American Journal of Science' of a series of articles on the laws of storms; and in 1834, in an article in the same journal on 'Hurricanes of the West Indies' gave a complete synopsis of the main points of his theory as developed by a more extensive analysis of observed phenomena. His views, known as the "rotary theory of storms," were accepted after some slight opposition; and Redfield, by his explanation of the mechanism of extended hur-

ricanes became one of the principal contributors to a scientific knowledge of the earth's atmosphere. He wrote also on geography and geology. As a naval engineer he devised the system of "safety barges," by which passenger service via the Hudson between New York and Albany was conducted by means of a passenger boat drawn by two steamers at such a distance as to avoid danger of explosions, the frequent occurrence of which had caused general terror. Thus originated the idea of tow-boats for the conveyance of freight. Redfield was also prominently interested in railway construction. A list of his published papers, from 1829 to 1857, includes 62 titles.

Redfield, S. D., city, county-seat of Spink County; on the Chicago, M. & St. P. and the Chicago & N. R.R.'s; about 35 miles south of Aberdeen. It is an agricultural and stock-raising region. It has a State Institution for the Feeble-Minded and the Redfield College, opened in 1887 under the auspices of the Congregationalists. Pop. (1890) 796; (1900) 1,015.

Redfin. See RED-HORSE; SHINER.

Redfish, the name of several fishes notable for their color: (1) In Alaska, the salmon more familiarly known by its name "blueback" (q.v.) in the Columbia River Valley; also called redfish about the lakes of northern Idaho. (2) On the California coast, a gaudily tinted wrasse (*Pimelometopon pulcher*), related to the eastern tautog, which reaches a weight of 12 or 15 pounds, and is taken in large numbers in the kelp offshore with hook and line. The Chinese salt and dry them. (3) The rose-fish (q.v.) of the Atlantic coast. (4) The red drum. See DRUMFISH.

Redgauntlet, *rēd-gānt'lēt*, a novel by Sir Walter Scott, published in 1824. Sir Alberick Redgauntlet, ardently espousing the cause of the Young Pretender in 1745, pays for his enthusiasm with his life. His widow, ascribing her bereavement to the politics of the Redgauntlets, desires to rear her children in allegiance to the reigning dynasty. Her efforts prove ineffectual and the tale is concerned with the plots to enthrone the Chevalier, into which young Redgauntlet is hurried by his uncle, an ardent Jacobite. Though showing haste, the story does not flag in interest, and even the minor characters—notably Peter Peebles, the crazy litigant, Wandering Willie, the vagabond fiddler, and Nanty Ewart, the smuggler—are living and individual.

Redgrave, Richard, English painter: b. Pimlico, London, 30 April 1804; d. London 14 Dec. 1888. After studying at the Academy, he was elected an A.R.A. in 1840, an R.A. in 1851. From 1847 he took a prominent part in art instruction, and in 1857 was appointed inspector general of art schools, which office, with that of surveyor of the royal pictures, he resigned in 1880. His principal pictures include 'Gulliver on the Farmer's Table' (1837); 'The Daughter of the Reduced Gentleman' (1840); 'The Return of Olivia'; and 'Country Cousins.' He wrote, with his brother, 'A Century of English Painters' (1866), and edited several valuable catalogues.

Redhead, a duck (*Aythya americana*), related to the pochard and canvas-back (qq.v.). From the latter the redhead may be readily

distinguished by its much shorter, broader, more strongly hooked bill, and brighter chestnut head, though it is frequently sold to the uninitiated as the more expensive canvas-back, to which it is little inferior in flavor. It is found in North America generally, breeds from the northern tier of States to high latitudes, and winters in Chesapeake Bay and southward. The nest is built of reeds, etc., with a lining of down and either on the ground or on a platform of reeds in the water; the seven or eight eggs are buff-colored and unmarked. Eastwardly this is one of the commonest species of ducks and congregates in great numbers in the sounds and estuaries of the Atlantic coast, consorting with canvas-backs, scaups, and other species of generally similar habits. It feeds on various aquatic animals, but more particularly on water celery and other aquatic plants. In the interior about the Great Lakes and elsewhere, these birds usually appear in flocks for a short time during the migrations and are said to visit the woods for the purpose of feeding on acorns and other mast like the wood-duck. The redhead is perhaps the best known and generally appreciated by gunners of all our ducks, but there is nothing especially distinctive of the method of its pursuit. Consult: Grinnell, 'American Duck Shooting' (1901); Job, 'Among the Waterfowl' (1902).

Reding, Aloys von, Swiss patriot: b. Schwyz, Switzerland, 6 March 1765; d. there 5 Feb. 1818. He became captain-general of his native canton in 1788, and defeated the French republicans at Morgarten Pass in 1798. In 1802 he founded a league in the eastern part of Switzerland with the purpose of re-establishing the old federal constitution, but was thwarted by French interference. In 1803 and in 1809 he was elected chief magistrate of Schwyz.

Redlands, rēd'landz, Cal., city in San Bernardino County; on the San Bernardino & R., the Atchison, T. & S. F., and the Southern Pacific R.R.'s; about 65 miles east of Los Angeles. It was settled in 1881 and in 1888 was incorporated. It is on the foothills of the San Bernardino Mountains, in a region famous for its scenic beauty. It is in a fruit section noted for its oranges. Fire-clay is found in the vicinity. The principal manufactures are clay and lumber products; and the trade is chiefly in oranges, raisins, and other fruits, wheat, barley, brick, lumber, and building stone. It has Saint Ursula's Academy, a Union High School, public and parish schools, and the A. K. Smiley Library. Two parks add to the attractions of the city. The government is vested in a board of trustees. They hold office four years. Pop. (1890) 1,904; (1900) 4,797.

Redleg, one of the best known of Old World partridges (*Caccabis rufa*), which is especially numerous in France, where it is the principal object of sport in the autumn. It has been introduced into England, but is not much liked because slow to fly, running speedily before the dog and so puzzling both the dog and the gunner trained to the different behavior of the British gray partridge. Several other species of the genus share the name, as the Barbary partridge (*C. petrosa*) of North Africa, the chukar (*C. chukar*) of India, etc. See PARTRIDGE.

Redmond, rēd'mōnd, John Edward, Irish political leader: b. Dublin 1851. He was educated at Trinity College, Dublin, studied law and was admitted to the bar. In 1876 he was elected a member of the House of Commons, and later held a position in the vote office. In the House he became a "whip" for the Irish party, and was one of the most active supporters of Parnell in his organization of the Irish Nationalist party. He made several trips to the United States and Canada in behalf of the Nationalists. When the party was divided over the question of the continuance of Parnell's leadership, he supported Parnell. In 1900, when the factions were united, he was made the leader of the united party, which he has effectively organized. He is both a skilled parliamentarian and an eloquent and forceful orator. He has published 'Historical and Political Addresses' (1898).

Redonda (rā-dōn'da) Island, West Indies, one of the Leeward group, situated between Nevis and Montserrat. Iron and alumina mines constitute its economic importance. It is a dependency of Antigua, and with Barbuda, another dependency, makes an area of 62 square miles. The total population of the three islands was 34,971 in 1901.

Redowa, rēd'ō-a, the name of a Bohemian dance introduced into England about 1846. The dance resembles the Polish mazurka. It was introduced into one of Meyerbeer's operas in 1849.

Red'path, James, journalist: b. Berwick-on-Tweed, England, 14 Aug. 1833; d. New York 10 Feb. 1891. He emigrated to Detroit, Mich., in 1848, and in 1852 removed to New York and became connected with the *Tribune*. In 1855 he went to Kansas and took part in the Free-Soil movement which he described for northern papers. Being already a confirmed anti-slavery advocate he traveled in the South for personal investigation of slavery conditions. With others he then undertook a scheme of colonization in Haiti and during his visits to the island was appointed by President Giffard commissioner of emigration in the United States. The breaking out of the Civil War put an end to his plans, and he entered the field as war correspondent principally attached to the armies of Gens. Sherman and Thomas. At the close of the war, he became superintendent of education in Charleston, S. C., reorganized its school system, and established colored schools and the Colored Orphan Asylum. In 1868 he established the Lyceum Bureau in Boston which arranged for the public appearance of lecturers and readers, which business was afterward purchased by Maj. J. B. Pond (q.v.). Resuming editorial work on the *Tribune*, he went to Ireland to report the famine of 1879-80. There he became interested in the Home Rule movement and devoted several years to its interests. In 1886 he became attached to the staff of 'The North American Review.' He assisted Jefferson Davis in preparing his history of the Southern Confederacy, and wrote, among other works, 'The Roving Editor, or Talks with Slaves in the Southern States' (1859); 'The Public Life of Captain John Brown' (1860); and 'Talks About Ireland' (1881).

Redpoll, a small linnet-like finch of the far northern regions, two or three species of which visit northern Europe, Canada, and the northern United States in winter. The males have the head and neck beautifully rose-red in hue.

Redroot. See CEANOTHUS.

Reds of the Midi, The, a story by Felix Gras (q.v.), published in 1896. It is a strong tale of the French Revolution. One Pascal Le Patine, in his old age, night after night, in the shoemaker's shop, tells the story of his youth when he joined the "Reds of the Midi" (the insurgents of southern France), went to Paris, and witnessed all the horrors of the Revolution. The prologue of the tale is pure autobiography, and many of the characters are drawn from life.

Redshank, or **Gambet**, a large migratory snipe-like sandpiper (*Totanus calidris*) of Europe and Asia, representative of a large group, the American species of which are called willets by gunners; its average length is about 11 or 12 inches; and its popular name is derived from the red color of the legs. The spotted redshank (*T. fuscus*) and the greenshank (*T. glottis*) are allied species.

Redstart, in the United States a small active migratory warbler of the genus *Setophaga*, especially *S. ruticila* of the eastern part of the country, whose colors are a charming contrast of black and orange-red in the male, the female being more nearly brown and yellow. It has a sharp, exclamatory, but pleasing spring song, and makes a pretty nest of bark-shreds, etc., in an orchard tree or garden bush. The European redstarts are small brownish birds, closely related to the redbreasts, but distinguished by a bright red tail. They construct nests chiefly among the ivy of ruined buildings, the eggs numbering five or six, and being of a greenish-blue color. The redstarts are active birds, feeding on fruits, seeds, and insects, which they pursue on the wing. The song is low, but sweet, and these birds are said to imitate very skilfully the notes of other feathered songsters.

Redtail, a common American hen-hawk (q.v.).

Redtop. See GRASSES IN THE UNITED STATES.

Red'way, **Jacques Wardlaw**, American geographer: b. Nashville, Tenn., May 1849. He was educated at the University of California and at Munich, Bavaria. He occupied the chair of physical geography and chemistry at the State Normal School of California, was engaged in mining engineering and exploring in California and Arizona in 1870-80, and later pursued geographical investigations in South America, Europe, and Asia. He has published: 'Manual of Geography' (1887); 'Manual of Physiography' (1900); 'New Basis of Geography' (1901); 'Commercial Geography' (1902); etc.

Redwing, a European thrush (*Turdus iliacus*), visiting Great Britain and southern Europe in winter, when they flock in the fields in search of insects and worms. The summer song is pleasing, but the winter notes are harsh and unmusical.

Red'wood, **Boverton**, English chemist: b. London 26 April 1846. He was educated at the University College School and at the Pharmaceutical Society of Great Britain. As an authority on the technology of petroleum he accompanied Sir Vivian Majendie on his tour of inspection to the petroleum districts of Europe and America. He is adviser on petroleum to the Home Office and is consulted as an authority in that field by different branches of the British government. He is a member of the leading English and American scientific societies, was a member of jury at the Paris Exposition in 1900 and appointed a member of the Royal Commission to the Saint Louis Exposition in 1904. He has published: 'Cantor Lectures on Petroleum' (1886); 'A Treatise on Petroleum' (1896); 'The Petroleum Lamp' (with J. H. Thomson, 1902); etc.

Redwood, the name of various sorts of wood, as an Indian dyewood, the produce of *Pterocarpus santalinus*; the wood of *Gordonia Hamatoxylon*, the redwood of Jamaica; that of *Pterocarpus dalbergioides*, or Andaman wood; that of *Ceanothus colubrinus*, the redwood of the Bahamas; that of *Soymida febrifuga*, of which the bark is used in India for fevers. In the United States, *Sequoia sempervirens* of the Pacific coast. See REDWOOD OF CALIFORNIA.

Redwood of California, the great cypress-like forest tree (*Sequoia sempervirens*) of the Pacific coast. It is of the same genus with the big trees (*S. gigantea*), botanically described under SEQUOIA; the latter occurs in scattered groups on the west slope of the Sierra Nevada, while the redwood forms dense forests on the west slopes of the Coast Range, where it forms the most important timber resource of the State. The forests were thoroughly studied by the government Bureau of Forestry in 1902, whose report furnishes the following facts: The redwood is popularly thought to occupy a strip of country 10 to 30 miles wide, from the Oregon line to the Bay of Monterey, but these boundaries do not cover its actual distribution. Two thousand acres of redwood exist in Oregon along the Chetco River. South of the Chetco a continuous redwood belt begins, and increases its width from 10 miles, at Del Norte County, to 18 or 20 miles, and keeps on unbroken to southern Humboldt County. Here is a break, but in Mendocino County the belt becomes dense again, and widens out to 35 miles. South of that county the tree grows in isolated patches as far south as the Santa Lucia Mountains.

The climate and topography that have brought about this limited distribution of the redwood deserve attention. North and south along the coast, in nearly parallel ridges, lie the mountains of the Coast Range, steep and rising to altitudes of 1,000 to 2,000 feet. A few large rivers and many smaller streams cut through them to enter the sea, and along their courses in places are broad bottom lands and gentle slopes. West of the Coast Range the climate is even and moderate, with a range from just below freezing to 80° F., and a yearly average of from 50° to 60°. Snow lies on the tops of only the highest ridges. Thirty to 60 inches of rain falls in the autumn and winter, and in the summer sea fog bathes the coast. But east of

REDWOOD OF CALIFORNIA

the mountains, less than 50 miles from the sea, lie hot interior valleys, never visited by the fog, parched and rainless in the summer, and wet only occasionally by the winter rains—conditions too unfavorable to permit the growth of the redwood. The forest may be considered in two types,—the "slope" and the "flat." The common type is the "slope"—that is the growth on the steep sides of the Coast Range, which is a mixture of redwood, red fir, tanbark oak, and white fir, with an occasional madroña or hemlock. As the slopes become moderate, the altitude lower, the soil deeper, and the water supply better, the redwood steadily gains on the other kinds and the forest becomes denser, until on the rich flats and in the gulches the second type is developed; on the best redwood "flats" no other tree grows.

The redwood grows to a greater height than any other American tree, but in girth and in age it is exceeded by the big tree of the Sierras. On the slopes 225 feet is about the maximum height and 10 feet its greatest diameter, while on the flats, under better conditions, it grows to be 350 feet high, with a diameter of 20 feet, and occasional giants exceed this. Most of the redwoods cut are from 400 to 800 years old. After the tree has passed the age of 500 years it usually begins to die down from the top and to fall off in growth. The oldest tree scientifically examined began life 531 A.D. The tree, when normal, has a straight, slightly tapered bole, clear for more than 100 feet, and a crown of horizontal branches that may occupy from a third to a half of its total length. The roots strike downward at a sharp angle, and are so large and so numerous as to form a compact mass of wood, in shape like an inverted funnel. The bark of the tree offers such a remarkable resistance to fire that except under great heat it is not combustible. It is of a reddish-gray color, fibrous in texture, and gives to full-grown trees a fluted appearance. The tree, however, assumes many shapes.

The redwood requires little of the soil except that it be moist, and those trees in a gully or along a creek are larger than their neighbors on the ridges. It is, however, so dependent on moisture of the air that this factor mainly or wholly determines its distribution, and the eastern limits of the forest are determined by the distance inland to which the sea fogs may drift.

The enemies of the redwood are few, and it suffers from them less than other trees. "The wind," remarks Fisher, "can scarcely uproot it, insects seem to do it little harm, and fungi seldom affect it. Even fire, the great enemy of all trees, though it may occasionally kill whole stands of young redwood growth, is unable to penetrate the fireproof sheathing of shaggy bark with which the old trees protect themselves." A large area of redwood forest in Santa Cruz County has been reserved as a national forest-park.

Reproduction.—The redwood forest consists of a mixture of trees of widely varying type, and keeps itself stocked by reproduction under its own shade. Seeds grow up very seldom, the seed itself seeming to have little vitality and the opportunities for its germination being rarely present, because it demands plentiful light. Hence new growth is almost exclusively by suckers, which, supported and nourished by full-

grown roots and stems, thrive under shade in which seedlings would wither. They thus survive and grow slowly, with little or no sun, until an old tree falls, lets in the light and they shoot up in rings about the stump into strong young trees. In 30 years, under favorable conditions, trees will result 16 inches in diameter and 80 feet high; and it is certain that it will be profitable to hold cut-over redwood lands for future crops. This second-growth timber has not the density and fine quality of the original, but is useful for many purposes, and large quantities have already been utilized.

Quality of the Wood.—Redwood is fitted for many uses. In color it shades from light cherry to dark mahogany; its grain is usually straight, fine, and even; its weight is light; its consistency firm, yet soft. It is easily worked, takes a beautiful polish, and is the most durable of the coniferous woods of California. It resists decay so well that trees which have lain 500 years in the forest have been sent to the mill and sawed into lumber. It has no resin, and resists fire, a fact which has recommended it as material for house-building, especially in San Francisco. Insects seldom injure it, because of an acid element its lumber contains. In sea water, however, the marine teredo eats off redwood piling as readily as other timber. Redwood is used for all kinds of finishing and construction for shingles, railroad ties, electric-light poles, paving blocks, tanks, and pipe staves. As a tie its average life, under heavy traffic, is six to eight years; as shingles it will last as long as 40 years. The chief difficulty in working redwood lies in the seasoning process, to dry it thoroughly being a slow and difficult process.

Lumbering.—The cutting of redwood for market began about 1850, and has steadily increased since with the market demand and growth of means of transportation. Its use is mainly confined to the State, and the greatest demand is from the southern counties. Occasional cargoes are sent across the Pacific, but it is rarely sent East, on account of the expense of transportation. It has never been a business giving extravagant profits. Several hundred thousand acres have already been cut over. A large part of this area has been completely cleared and cultivated or used for pasture but much remains as wild brush, believed to be useless; but it is now known that ordinarily a profitable second growth will arise, so that the anticipated extinction of the tree is no longer to be feared.

Felling one of these enormous trees is an operation requiring great experience and skill on the part of the woodsman, who must cause the vast trunk to fall precisely where he intends it to lie, and must take care that it is not split or broken by the concussion, to prevent which a bed is smoothed and prepared for it. A platform is then erected surrounding the trunk from six to eight feet above the ground. With a saw an undercut is made through the trunk, not quite to the centre, and from the opposite side a crosscut is sawed, ending a foot or two above the undercut and leaving a section of solid lumber between. When the exact place where the tree is to fall is selected, the choppers ascend the platform and with axes hew out an angular-shaped piece having the undercut as a

base. When this cut is made the second or crosscut is wedged till the tree topples over and falls to the ground, the solid section of the trunk, not pierced by the cuts, supporting the tree till the centre of gravity is passed, and then the mighty frame falls on its prepared bed almost intact.

The next operation is performed by the "ringers" and "peelers." Every 12 or 14 feet, as required, a ring is cut around the circumference of the bark, and afterward the peelers with crowbars and wedges "peel" the bark from the prostrate trunk. Finally all of the trees are stripped but surrounded with an immense accumulation of debris of bark and branches, which must be removed before the trunks can be sawed into suitable lengths for conveyance to the mill. The ground is cleared by fire, precaution being first taken to plug up the "splits" in the trunk with clay so that the fire may not reach the interior of the tree. A foggy day is chosen and a still one. Fire is started and in a short time the tract is burning with a fierce heat that quickly reduces the piles of bark and brush to ashes, and leaves an unobstructed field for the removal of the timber which has been scarcely charred by the intense heat to which it has been subjected.

The trunks as they lie are then sawed into stated lengths, and then follows the arduous task of conveying these enormously heavy sections to the railroad. Temporary skidways are laid down and roads constructed. Chutes down which the logs pass have to be planned, and on these, guided by the skilful woodsmen, the unwieldy logs at last reach their destination. The work is assisted by donkey engines on sleds, which are hauled to the top of the steep banks and into seemingly impossible situations.

In 1903, the yield of virgin redwoods on the northern flats was from 125,000 to 150,000 board feet per acre. About Humboldt Bay it was from 50,000 to 75,000 feet per acre; and on slopes like those in Sonoma County, from 20,000 to 30,000 feet. The amount of timber got out of a redwood forest is only a small proportion of what the stand contained. At least a quarter of the timber is destroyed in felling and in the burning that follows, and of what remains all the broken and misshapen logs are left on the ground.

Bibliography.—Consult: Fisher, 'Report on Redwood,' Bureau of Forestry (Washington, 1903); and authorities on California, especially Muir, and on forestry. See FORESTRY.

Reed, red, Andrew, English philanthropist: b. London 27 Nov. 1787; d. there 25 Feb. 1862. He was educated at Hackney College, London, ordained pastor of the Congregational Chapel at New Road, London, in 1811 and remained in this charge until 1861. He visited the United States in 1834 to study educational and religious systems and established in London the Orphan Asylum (1813), Infant Orphan Asylum (1827), Asylum for Idiots (1846), Royal Hospital for Incurables (1855), and an Asylum for Fatherless Children in Croydon. He published 'Visits to the American Churches' (1836); 'Advancement of Religion the Claim of the Times' (1847); etc. Consult 'Memoirs,' edited by his sons (1863).

Reed, Sir Charles, English politician and philanthropist, son of Andrew Reed (q.v.): b.

near Sonning, Berkshire, 20 June 1819; d. Tottenham, Middlesex, 25 March 1881. He amassed a large fortune in the typefoundry business, took an active interest in the philanthropic works of his father, served in Parliament as member for Hackney in 1868-74, and was re-elected for Saint Ives in 1880. He was president chairman of the London School Board in 1873-81 and in 1874 he was knighted.

Reed, Charles Alfred Lee, American surgeon: b. Wolf Lake, Ind., 9 July 1856. He was educated at Miami University, Oxford, Ohio, and studied medicine at the Cincinnati College of Medicine and Surgery. He was professor of gynecology and abdominal surgery at the Cincinnati College of Medicine and Surgery 1882-95; became gynecologist at the Cincinnati Hospital in 1896; and was president of the American Medical Association in 1900-1. He has published various professional monographs and a 'Text Book of Gynecology' (1900).

Reed, Sir Edward James, English naval architect: b. Sheerness 20 Sept. 1830; d. 30 Nov. 1906. He was educated at the School of Mathematics and Naval Construction in Portsmouth, was at one time connected with Sheerness dockyard, and having become an authority on naval architecture, was appointed chief constructor to the navy, for which he designed a number of ironclads and other vessels. He resigned in 1870 on account of his objections to rigged sea-going turret ships which he found to be growing in favor. He sat in Parliament for the Pembroke boroughs 1874-80, for Cardiff in 1880-95, and again 1900-06. In 1886 he was a junior lord of the treasury under Mr. Gladstone. In 1878 he visited Japan on the invitation of the government of that country. He published: 'Japan, its History, Traditions, and Religions' (1880); 'The Stability of Ships' (1884); 'Modern Ships of War,' with Admiral Simpson (1888); 'Poems' (1902).

Reed, Elizabeth Armstrong, American author: b. Winthrop, Maine, 16 May 1842. She was married to H. V. Reed in 1860. She was chairman of the Woman's Congress of Philology in Chicago in 1893, and has been a member of several learned societies. She has published: 'The Bible Triumphant' (1866); 'Hindu Literature: or the Ancient Books of India' (1891); 'Persian Literature, Ancient and Modern' (1893); 'Primitive Buddhism, its Origin and Teachings' (1896); etc.

Reed, George Edward, American educator: b. Brownville, Maine, 21 March 1846. He was graduated from Wesleyan University, Middletown, Conn., in 1869 and after studying theology in Boston University, entered the New England Southern Conference in 1870. He filled important appointments in the Methodist denomination 1870-89 and in the year last named became president of Dickinson College, Carlisle, Pa.

Reed, Hugh T., American military officer: b. Richmond, Ind., 17 Aug. 1850. He was graduated from West Point in 1873 and served chiefly on frontier duty until 1881 when he was appointed inspector-general on the staff of Governor Porter of Indiana. He was retired for disability in 1880. He has published: 'A Calendar of the Dakota Nation' (1887); 'Cadet Regulations' (1881); 'Broom Tactics' (1883); etc.

THOMAS BRACKETT REED.

Reed, Joseph, American soldier and statesman: b. Trenton, N. J., 27 Aug. 1741; d. Philadelphia 5 March 1785. He was graduated from Princeton and spent two years studying law in the Middle Temple, London. He returned to Trenton and took up the practice of law, and in 1767 was appointed deputy secretary of New Jersey. In 1774 he was appointed a member of the committee of correspondence for Philadelphia and in 1775 was president of the 2d provincial convention held in Pennsylvania, and endeavored to defeat the intention of arming the province. His English connections through his marriage inclined him to a conciliatory view of the English position, though he opposed the principle of parliamentary taxation. On Washington's appointment to commander-in-chief, Reed became his military secretary. In 1776 he was made adjutant-general, but resigned the next year and refused the office of brigadier-general and also first chief justice of Pennsylvania, preferring to remain Washington's volunteer aide, without rank or pay. In September 1777 he was elected to the Continental Congress, but continued with the army and took part in many engagements. In 1778 he was made chairman of a Congressional committee to confer with Washington concerning the management of the ensuing campaign. In December 1778 he was chosen president of the Supreme Executive Council of Pennsylvania and continued in office for three years, during which time he was one of the founders of the University of Pennsylvania, and favored the doing away with the proprietary powers of the Penn family. After the English peace commissioners had failed to treat with Congress, attempts were made to bribe Reed together with other high officials. He replied: "I am not worth purchasing, but such as I am, the king of Great Britain is not rich enough to do it." In 1780 he was invested with extraordinary powers and was principally successful in quelling the dissatisfaction of the Pennsylvania troops in the army. Consult 'Life' by Henry Reed (1846); W. B. Reed, 'Life and Correspondence' (1847).

Reed, Myrtle, American author: b. Chicago, Ill., 27 Sept. 1874. She has published 'Love Letters of a Musician' (1899) which has been widely read; 'Later Love Letters of a Musician' (1900); 'The Spinster Book' (1901); 'Lavender and Old Lace' (1902).

Reed, Thomas Brackett, American statesman: b. Portland, Maine, 18 Oct. 1839; d. Washington, D. C., 7 Dec. 1902. He was graduated from Bowdoin College in 1860, winning the first prize in English composition. He then took up the study of law, went to California in 1863, and was admitted to the bar there. In 1864 he was appointed assistant paymaster in the United States Navy, and assigned to a gunboat patrolling the Tennessee, Cumberland and Mississippi rivers. On receiving his discharge from the navy, he returned to Portland and established a law practice. His interest in public affairs and ability as a speaker soon made him prominent in the Republican party in Maine, and in 1868 he was elected to the lower house of the State legislature, where he served two years. He then entered the State Senate, and before his term had expired, was elected attorney-general of Maine. From 1874 to 1877 he was city

solicitor of Portland, and in 1876 was elected to Congress and served there continuously until his resignation in 1899. He first attracted attention in April, 1878 by a speech in opposition to a bill to reimburse William and Mary College for losses sustained at the hands of the Federal troops during the War. From that time his readiness in debate, knowledge of parliamentary law, and marked executive ability made him a power in the House. In 1885-9, while the Republicans were in the minority, he was their acknowledged leader on the floor, and in 1889 was chosen Speaker of the House. The Republican majority was small, and the business of the House continually delayed by the "filibustering" course of the Democrats. Speaker Reed did not hesitate to enforce strict rulings against such tactics, and ordered the clerk to count as present all members actually in the House, whether they answered to the roll-call or not. This aroused the strongest opposition from the Democrats; his conduct was denounced as tyrannous and illegal, and the epithet of "Czar" applied to him. His rulings were, however, sustained by the House, and later by the decision of the Supreme Court; and in the next Congress, when the Democrats were again in power, he had the satisfaction of seeing his rules adopted by the party that had so violently denounced them. In 1895 and 1897, he was again elected speaker, and this time his conduct of the business of the House met with the approval of both parties. As Speaker, he had a powerful influence in constructing and guiding legislation, though his name is connected with no single important measure, and he raised that office to a position second only to that of the President of the United States. He was a consistent opponent of free silver, and was largely instrumental in defeating the free silver bill of 1890. He was also a strong advocate of the policy of protective tariff, but was opposed to the administration policy in regard to imperialism and the questions resulting from the Spanish War. To this fact his resignation from Congress in 1899 is sometimes attributed. In 1896 he was a prominent candidate for the presidency, and at the Republican National Convention received 84½ votes, being second to McKinley. After 1899 he was engaged in the practice of law in New York. He contributed frequently to the magazines, edited a series of volumes on oratory entitled 'Modern Eloquence,' and published 'Reed's Rules of Parliamentary Procedure.'

Reed, Walter, American military surgeon and bacteriologist: b. Harrisonburg, Rockingham County, Va., 1851; d. Washington, D. C., 23 Nov. 1902. He was graduated from the medical department of the University of Virginia and from the Bellevue Hospital Medical College of New York, and was made 1st lieutenant assistant-surgeon, U. S. A., 26 June 1875. His promotions were captain assistant-surgeon 26 June 1880, and major surgeon 4 Dec. 1903. In 1890-1, while stationed at Baltimore, he made particular study of bacteriology in the laboratory of Professor William Welch, of the Johns Hopkins University; and established a laboratory of his own, in which he gave instruction to the student-officers of the Army Medical School. As curator of the Army Medical Museum, at Washington, D. C. (from 1893), he continued his researches, and soon became

known as one of the leading bacteriologists of the country. His ability was especially displayed in his investigations of the cause and progress of epidemic diseases. In 1898 he was made head of a board for the study of the epidemics of typhoid occurring among the troops collected for the Spanish-American war. After the war he made several voyages to Cuba, and was on duty at Havana, studying the diseases of the island, and more particularly yellow fever, as a member of a board for its investigation. After a series of brilliant experiments, he was able to announce that yellow fever is conveyed by a certain variety of mosquito (*Stegomyia fasciata*), individuals of which become infected by biting persons ill with the fever and by their bite introduce it into the blood of non-immunes. The United States military government at once proceeded to measures of extermination which banished the fever from Havana, where it had prevailed for three centuries. The Atlantic seaboard of the United States was also thereby freed from constant peril. This achievement must rank among the important triumphs of bacteriological science. Consult Keane, 'Scientific Work and Discoveries of the Late Major Walter Reed' (Senate Doc. 118).

Reed, William Bradford, American lawyer: b. Philadelphia 30 June 1806; d. New York 18 Feb. 1876. He was graduated from the University of Pennsylvania in 1825 and accompanied Joel R. Poinsett to Mexico as private secretary. Then taking up the practice of law, he became attorney-general of Pennsylvania in 1838. In 1850 he was appointed professor of American history at the University of Pennsylvania, and in 1857 became United States minister to China. The next year he negotiated the treaty with China which regulated commercial relations as well as made more secure the rights obtained by the previous treaty of 1844. Subsequent to his return to America in 1860 he settled in New York and corresponded for the London *Times* besides contributing to 'The American Quarterly Review' and the 'North American Review.' He engaged in a controversy with George Bancroft, concerning certain statements repeated by the historian to the effect that his grandfather, Joseph Reed, meditated abandoning the American cause and going over to the British. In this controversy Reed wrote 'President Reed of Pennsylvania, a reply to George Bancroft and Others' (1867). Bancroft responded with 'Joseph Reed, an historical Essay' (1867), to which Reed replied with 'A Rejoinder to Mr. Bancroft's Historical Essay' (1867). He published 'Life and Correspondence of Joseph Reed' (1847); 'Life of Esther de Berdt' (1853).

Reed, (1) in music, the sounding part of several instruments, such as the clarinet, bassoon, oboe, and bagpipe, so called from its being made from the outer layer of a reed (*Arundo sativa* or *donax*) found in the south of Europe. The name is also applied to the speaking part of the organ, though made of metal. Reeds are generally divided into two kinds—the beating reed, used in the organ, clarinet, etc., requiring to be placed upon a tube to produce a musical sound, and the free reed, used in instruments of the harmonium and concertina kind. (2) In weaving, an appurtenance of the loom, consisting

of two parallel bars set a few inches apart, and furnished with a number of parallel slips or reeds, called dents, between which the warp threads are passed. The reed is set in a swinging frame, called a lathe, lay, or batten. In the hand lathe, the bottom of the batten is furnished with a shelf, called the shuttle race, along which the shuttle is driven. The office of the reed is to beat the weft up to the web, and the force of the blow determines the compactness of the fabric.

Reed, Flue, and Stringed Instruments, Temperament, Tuning, and Voicing of. *Temperament*.—The intervals of the perfect octave are divided naturally into 53 parts or commas, the successive sounds of the diatonic scale being separated by these commas into the following intervals:

| | | | | | |
|---|----|---|---|--------|----|
| C | to | D | 9 | commas | 9 |
| D | " | E | 8 | " | 17 |
| E | " | F | 5 | " | 22 |
| F | " | G | 9 | " | 31 |
| G | " | A | 8 | " | 39 |
| A | " | B | 9 | " | 48 |
| B | " | C | 5 | " | 53 |

Nature's arbitrary division of the octave, into intervals of exact dimension, is not satisfactory, nor does it admit of an exact equalizing; the only possible approach to it being by the method known as the "even temperament," which method or principle was discovered and established by John Sebastian Bach, in the early part of the 18th century, who learned that certain intervals would bear being tuned sharp (in excess of) or flat (short of) perfect; the thirds and fourths being tuned sharp and the fifth tuned flat of perfect, thus distributing among all the 12 keys of the octave, the three commas or points by which the major tones exceeded the minor, thus rendering equal the five tones in the diatonic series. Previous to this time, it had been the custom to tune to perfect intervals, those keys having not over 3 sharps or flats and play in those keys only. The problem to be solved was to so divide the octave into 12 semitones by fixed sounds, that each one of the 12 sounds could be made the key note upon which a properly proportioned diatonic scale could be based, either in the major or minor form and a melodic or harmonic progression made possible through the whole 24 major and minor scales; so that from any one of these 12 notes, a uniform chromatic scale could be constructed, thus making possible, modulations of unlimited variety and beauty.

The method then of tempering the notes of keyed instruments, consists in arbitrarily adjusting the enharmonic diesis, that is, the distinction there is naturally between D sharp and E flat, G sharp and A flat, by tuning these notes too sharp for one and too flat for the other of these natural tones or intervals, and by making a similar compromise between the more minute discrepancies of the diatonic scale. Thus while no interval will be exactly true, yet none will be so adjusted as to shock the ear by false intonation, but rather add a color or quality to the tonality of the instrument, which, though harmonious, would otherwise be characterless.

Rule for Tempering Pianos and Organs.—Tune middle C to desired pitch, then tune F—fifth below—sharp of C, until between C and F, there result three beats in five seconds. Next

tune A-sharp—fourth above F-sharp of the latter, until there results one beat, each second. Next tune G—fourth below middle C—flat of C, by one beat a second; then tune D—fifth above—flat to G, by three beats in five seconds; A—fourth below—flat to D; E—fifth above—flat to A; B—fourth below—flat to E; F-sharp—fourth below—flat to B; C-sharp—fifth above—flat to F-sharp; G-sharp—fourth below—flat to C-sharp; D-sharp—fifth above—flat to G-sharp, which will make D-sharp as sharp of A-sharp, as the latter is sharp of the first F tuned.

In all the above intervals, the fifths beat three times in five seconds; the fourths beat once a second, or five times in five seconds. All the 12 notes, from F below middle C to first E above, have now been tuned; the temperament has been confined to the smallest possible compass to lessen the liability of errors, and if the first F above middle C is now tuned three beats in five seconds, flat of A-sharp below, it will be a perfect octave to the first F tuned.

Tuning.—The art, principle or act of so adjusting the intonations of keyed musical instruments as to make possible consecutive musical tones agreeable to the ear. The method varies according to the kind or character of the instrument. Where strings are used, as in pianofortes, harps, violins, violas, guitars, zithers, etc., tuning consists in adjusting the tension of the strings by turning the pins or pegs around which the strings are wound. In band and orchestral wind instruments, a crook or joint is used, sometimes called a slide, because it slides in and out to adjust the length of the column of air in the tube to the point where the desired pitch of the fundamental note is obtained.

In reed organs it depends upon the adjustment of the comparative weight, length and thickness of the reeds, and in pipe organs upon the length of the vibrating column of air in the flue pipes.

In the tuning of strings, the pitch is determined by the size, length and tension of the wire. In reed tuning the desired pitch is obtained by filing or scraping the reed; at the base or fixed end to flatten the tone and at the point or free end to sharpen it.

Organ pipes are tuned according to their construction. The large open flue wood pipes are lowered or flattened in pitch by being lengthened by a sliding cap or by a board fastened to the back, at the top, and is raised or sharpened in pitch by being shortened.

The large open metal flue pipes are tuned by cutting away or adding to the length, or by a slit in the back near the top, making two flaps to be opened or closed as required; closing them lowers the pitch, opening them raises it; the smaller metal pipes being tuned by the use of a conical horn, with which the tops of the pipes are contracted or expanded, as the pitch is to be lowered or raised respectively. Stopped metal pipes are tuned by a cap, raised or lowered as desired, and reed pipes by adjusting the wire which bears upon the reed, the raising or drawing up of the wire increasing the effective length of the reed and so flattening it and *vice versa*. In the tuning of pipe organs, the reed pipes are the last to be tuned, since

they are the most liable of all the pipes to become disarranged.

Voicing of Keyed Musical Instruments.—The voicing of organ pipes consists in the adjustment of their various parts, consisting of the mouth, throat, lips, languid and ears, the correct method of treatment having been learned by experience, many years ago and of late years demonstrated by mathematical calculations, and by the investigations of scientists.

The languid is that flat piece of the pipe which lies horizontally above the upper part of the foot, and it is against this languid, the "sheet of wind" is forced from the "wind way" below. Some of the pipes have the languids grooved upon their face, as one method of voicing, and some metal pipes are voiced by bending the ears, which are placed on either side of the mouth. Pipes once voiced at the factory seldom need any alteration.

The voicing of reeds in the common house organ is accomplished by giving the free end of the reed, a slight curl or circumflex, and this also causes the reed to speak or sound more promptly and with less pressure of wind.

The voicing of pianos consists in the stabbing of the felt of which the hammers are made, by several needles fastened in a handle. The thrusts should be made directly toward the centre of the hammer and not through the top of the felt, from the sides. In the making of hammers, which is done by machinery, one entire set being covered with felt at a time, there is a variation as to hardness in the individual hammers, and voicing is relied upon to lighten up the felt, and give a uniform character of tone throughout the entire scale of the piano.

Author of 'Construction, Tuning and Care of the Pianoforte.'

Reed-bird. See BOBOLINK.

Reed Canary Grass, a grass of the genus *Phalaris*. See GRASSES IN THE UNITED STATES.

Reedbuck. See REITBOKS.

Reeder, Andrew Horatio, American politician, first governor of Kansas Territory: b. Easton, Pa., 6 Aug. 1807; d. there 5 July 1864. He practised law at Easton and was prominent Democratic politician when, in 1854, he was appointed by President Pierce the first governor of the newly formed territory of Kansas. Upon arriving at his post he at once rendered his position difficult by declaring his intention rigidly to put down the violence resulting from the conflict of the two parties respecting slavery. In the election of March 1855 more than three fourths of the votes cast were illegal, but the governor issued certificates of election to all claimants whose papers were regular and against whom no protests or official notice of frauds were presented. His action he defended as strictly legal and declared that any other would have been revolutionary, though he confessed to knowledge of the fraudulent voting. He was dismissed from office by the President and he returned to Lawrence to reside and to join forces with the Free-Soil movement. He was nominated by this party as territorial delegate to Congress. A legislature of the Free-State party formed under the instrument known as the Topeka Constitution elected him to the United States Senate in 1856.

But the election was refused ratification by Congress. President Lincoln appointed him a brigadier-general at the outbreak of the War, but considerations of age induced him to decline. Consult: Spring, 'Kansas' (1885); Robinson, 'The Kansas Conflict' (1892).

Reedfish, a crossopterygian ganoid fish (*Calamoichthys calabaricus*), which, with the bichir (q.v.) is the only survivor of a group prominent in Palaeozoic time, which dwells in the sluggish reedy rivers of the Senegal coast of Africa, searching the mud of the bottom for prey.

Reef, the part of a sail comprehended between the top or bottom and a row of eyelet holes generally parallel thereto. The object of the reef is to reduce the surface of the sail in proportion to the increase of the wind; for which reason there are several reefs parallel to each other in the superior sails; thus the top-sails of ships are generally furnished with three reefs, and sometimes four; and there are always three or four reefs parallel to the foot or bottom of those main-sails and fore-sails which are extended upon booms. When a reef has to be taken in the sail is slightly lowered; the men climb out along the lower boom or yard, which they lean over, with their feet supported by the foot-ropes, fold the loose portion of the sail around the yard, and tie them up with the cords inserted in the eyelet-holes. As the operation of reefing is dangerous in stormy weather many ships are now fitted up with a patent apparatus by which sails may be reefed from the deck.

Reef also implies a chain of rocks lying near the surface of the water.

Reel, a revolving contrivance on which fibre, thread, cord, rope, fabric, etc., are wound, to form them into hanks or skeins, and for various other purposes; applied to:

In agriculture, a device having radial arms carrying horizontal slats, and rotated by gear or pulley connected with the axle of a harvester, for pressing backward and holding the stalks of grain in position for being severed by the knives. In angling, a skeleton barrel attached to the butt of a fishing rod, around which the inner end of the line is wound, and from which it is paid out as the fish runs off with the bait, and is gradually wound in again as his struggles become less violent, bringing him to land or to the landing net. In baking, a cylinder with radial arms rotating in a heated chamber, carrying pans in which loaves of bread are placed for baking in the reel-oven. In cotton machinery, a machine on which cotton is wound, making hanks of thread. In domestic industry, a spool or bobbin of wood on which cotton, thread, silk, etc., is wound for use in sewing.

Also the name of a lively rustic dance in which the couples sometimes swing or whirl round, and sometimes pass, forming the figure 8. In the United States, the Virginia reel is widely popular. Also the music for such a dance, generally written in common time, but sometimes in jig time of six quavers to a bar. The Scotch dance known as a reel is executed by two couples, the music for which is generally written in common time of four crotchets in a bar, but sometimes in jig time of six quavers.

Reem, in Scriptural zoology, *Bos primigenius*. In the Authorized Version the influence

of the Septuagint has prevailed, and the word is translated "unicorn," but erroneously, as the mention of two horns on one reem (Deut. xxxiii. 17) proves. The word unicorn has disappeared from the Revised Version, wild ox being substituted for it; but in Num. xxiii. 22, the alternative rendering ox-antelope (*Oryx leucoryx*) is given in the margin. The term is still a vernacular name among the Arabs of the Sahara for a gazelle (*Gazella loderi*).

Rees, rês, Abraham, English Presbyterian clergyman: b. Llanbrynmair, Wales, 1743; d. 9 June 1825. He prepared for the ministry at Hoxton Academy, where in his 19th year he was appointed mathematical tutor to the institution, and soon after resident tutor, in which capacity he continued upward of 22 years. He was pastor to the Presbyterian congregation of St. Thomas', Southwark, 1768-83, and of a congregation in the Old Jewry from 1783 till his death. In 1776 he undertook a revision and expansion of 'Chambers' Cyclopædia,' which he completed in 1785. The success of this work led him to a new undertaking, similar in its nature, 'The New Cyclopædia,' in 45 volumes (1802-20), republished at Philadelphia in 47 volumes.

Rees, John Krom, American educator: b. New York 27 Oct. 1851; d. there 9 March 1907. He was graduated from Columbia in 1872, and from the Columbia School of Mines in 1875. He filled the position of assistant professor of mathematics in the Columbia School of Mines 1873-6, and was professor of astronomy in Washington University, Saint Louis, 1876-81. He was director of the observatory and instructor in geodesy and practical astronomy in Columbia 1881-4 and from 1884 professor of astronomy there. He was president of the New York Academy of Sciences in 1894-6, was elected fellow of the Royal Astronomical Society of London; and in 1901 received the decoration of Chevalier of the Legion of Honor.

Reese, rês, Michael, Californian pioneer: b. Heinsforth, Bavaria, 1816; d. Germany 2 Aug. 1878. Apprenticed to a tanner he worked at his trade until he emigrated to the United States, and there after some reverses he established a jewelry business in which he was successful. In 1850 he went to California and began investing in San Francisco real estate. When the Fraser River excitement was at its height, Berri, a Swiss banker, disheartened as to the future of San Francisco, expressed to Reese his desire to part with his holdings. Reese having a firm belief in the coming importance of the city purchased Berri's property and thus laid the foundation of his great wealth. Among his benefactions was his gift to the University of California of the Lieber Library. The Michael Reese Hospital of Chicago, Ill., is his memorial, while his legacies to charities in the aggregate reached half a million dollars.

Reeve, rêv, Tapping, American jurist: b. Brook Haven, L. I., October 1744; d. Litchfield, Conn., 13 Dec. 1823. He was graduated from Princeton in 1763 and in 1767-70 was engaged as a tutor there. In 1772 he established a law practice at Litchfield, and during the war served as a recruiting officer and as a member of various committees of safety and defense. In 1784 he opened a law school at Litchfield which became justly famous and for years was without

an American rival. He conducted it without assistance until 1795, when he became associated with James Gould, who succeeded him in 1820. He was a judge of the supreme court of Connecticut in 1798-1814, served as chief justice for a short time, and subsequently served a single term in each the legislature and the council, after which he declined to hold further office. He was a Federalist, a lawyer of high ability, and was the originator of the movement to secure to married women the legal right to dispose of their own property. He published: 'The Law of Baron and Femme; of Parent and Child; of Guardian and Ward; of Master and Servant,' etc. (1816), republished in numerous editions; and 'A Treatise on the Law of Decent' (1825).

Reeve, a bird. See **RUFF**.

Reeves, rēvz, Helen Mathers, English novelist: b. Misterton, Somerset, 26 Aug. 1853. In 1876 she was married to Henry Albert Reeves, a London surgeon. 'Comin' Through the Rye,' her first story (1875), was widely popular both in this country and her own, and among her later fictions are 'Cherry Ripe' (1877); 'As He Comes Up the Stair' (1878); 'My Lady Green Sleeves' (1879); 'The Sin of Hagar' (1896); 'Becky' (1900). Her style is pleasing and animated and the interest of her novels is well sustained.

Reeves, John Sims, English tenor singer: b. Woolwich, Kent, 26 Sept. 1818; d. Worthing, Sussex, 25 Oct. 1900. He studied music and, in 1832, became organist in the church of North Cray, Kent, and made his first appearance as a singer in 1839 on the Newcastle stage. He first sang in London in 1842, and having studied in Paris and Milan made his first appearance at the La Scala theatre of the latter city as Edgardo in Donizetti's opera 'Lucia di Lammermoor.' His voice was of wide compass and great beauty — mellow and powerful, capable of the tenderest pathos and of the most stirring martial appeal, but always controlled by genuine artistic feeling and knowledge. He was heard to most advantage in the concert hall and in oratorio parts, and in such pieces as 'Guy Mannering' he displayed considerable histrionic ability. He published 'Life and Recollections' (1888); and 'My Jubilee' (1889).

Referendum, a reference to the popular vote of the question whether a proposed measure shall become a law. American State constitutions, and amendments thereto, are adopted by popular vote, and special measures are sometimes submitted by legislative action to the decision of the electors. In some cantons of Switzerland a method resembling the referendum has been practiced since the 16th century. According to the Swiss federal constitution, all constitutional amendments must be ratified by the Swiss electorate before they become law. Other measures must be submitted to the popular vote, if demanded within 90 days after their publication by 30,000 voters, or by the governments of eight cantons. During the 17 years, 1874 to 1891, out of 149 laws, 27 were referred to the people; of these 15 were rejected. The referendum has worked so well that it has conquered all opposition to it, and it is now generally regarded as a check on hasty and class legislation. It will be observed that the

essence of it is that it submits to the people a single and clear issue upon which they may give their decision. There exists also an obligatory referendum in eight cantons, where every law and every expenditure beyond a fixed maximum must be submitted to the mass of the electors, and it is not necessary that a demand for this submission to the electors should be made.

In the United States the movement in favor of the referendum has been making slow but steady and non-partisan progress for more than 12 years. Inspired by the success of direct legislation in Europe, a number of political reformers in New Jersey organized the first referendum league in 1892. Although numerically a small body, and having but meagre funds at their command, the members of this organization continued to preach the doctrines of the new political reform, both by voice and pen, until, as the result of the agitation which they inaugurated, four States now have direct legislation sections incorporated in their constitutions. The first State to adopt the new method of legislation was South Dakota, which, in 1898, passed the necessary amendment to its constitution. In 1900 the people of Utah cast a similar vote, and they were followed by Oregon in 1902, and Missouri in 1904. In Oregon the adoption of this legislative reform aroused so much opposition that the enemies of the measure took the matter to court, where a minor judge declared the amendment unconstitutional on the ground that it was not in accord with the provisions of the Federal Constitution. This decision was not accepted by the friends of the reform, however, and the question was immediately taken to the Supreme Court of the State, where, by a strong and decisive judgment, the decision of the lower court was reversed and the constitutionality of the amendment was established for all time.

In 1897 the legislature of Nebraska passed a law permitting any city within the State to adopt direct legislation methods in the conduct of its affairs upon the vote of a majority of its citizens. In the same year Iowa extended the initiative to all questions of franchise excepting those of public ownership, and other States, especially throughout the West, have since passed laws which indicate the existence of a popular demand for direct legislation.

The greatest development in the direct legislation reform as applied to municipalities is also shown in the West, particularly along the Pacific coast. In 1892, Seattle, Wash., adopted the measure, and its example was quickly followed by Buckley, Wash., Alameda, Cal., Vallejo, Cal., and several other small cities. In 1900, San Francisco obtained it. Sacramento, Cal., followed, then Los Angeles, Cal., and Portland, Ore. East of the Rocky Mountains, Denver, Col., Minneapolis, Minn., Detroit, Mich., and Nashville, Tenn., are among the larger cities which have applied these methods to the extension of franchises, if not to other questions.

As applied to the United States, the exercise of the referendum means that no law, or, if adopted by a city, no ordinance, may go into effect until a specified time has elapsed, during which period, if a reasonable minority of the people petition for a referendum on that question, the law cannot become operative until after the following election, when a majority of the popular votes either ratifies or rejects it. The length of time which must elapse before the bills

REFINING OF METALS—REFLEX ACTION

passed by the legislature take effect as laws is usually 60 days, while the percentage of voters which must sign the petition to secure a referendum varies from 5 per cent in South Dakota to 25 per cent in Washington. The latter percentage is so high, however, that the law has become practically inoperative.

In the general plan for direct legislation the referendum, by giving the people the veto power over bad laws, represents the negative side of the reform movement. The positive, or constructive side of direct legislation is the "initiative," by means of which a reasonable minority of the voters (the number ranging from 8 per cent in Oregon to 15 per cent in Los Angeles, Cal.) may file a petition for a law, or, when a city, an ordinance. Without reference to the existence of committees or any legislative bodies, that question must then go before the people for their judgment, and, if it is approved by a majority of the popular votes cast, it becomes a law. In other words, while the referendum gives the individual voter power to prevent the enactment of bad laws, the initiative gives him the power to suggest good laws and to see that they are enacted by his own vote.

The value of this "initiative" was shown in Oregon in June 1904, when the first State law ever actually enacted by the people, independent of any action on the part of the legislature, was adopted. This was a Direct Primary Law, a measure which had aroused much opposition among the professional politicians, but which, when brought before the people upon the petition of 3 per cent of the voters, was carried by a vote of more than 5 to 1. The Local Option Law, which had met with a long series of defeats at the hands of the legislature, was also passed, under the initiative, by a vote of nearly 4 to 1.

Although the "recall," or, as it was formerly termed, the "imperative mandate," has not been made a part of the direct legislation laws of many of the States and cities, not a few have taken advantage of the opportunity to incorporate it. The exercise of this "mandate," or "recall," gives the people power to vacate any public office at their will. If any public official has failed to do his duty, or has been guilty of any act that would stamp him as unworthy of the future confidence of the people, a reasonable minority of the voters may petition for his recall. An election must soon follow the filing of this petition, and, while the "recalled" official may stand for re-election, if he fails to secure a majority of the votes cast, the successful candidate serves the remainder of his term. As the "recall" is too powerful an instrument to be used except in extreme cases, the number of voters who must sign such a petition is usually placed as high as 25 per cent, the percentage required in Los Angeles, Cal., where, in 1904, one of the councilors of the city was recalled and a successor elected, this being the first time that an American public official has been ousted during his term of office and another appointed to take his place by the direct vote of the people.

Refining of Metals, in metallurgy, the last step in the purifying of gold, silver, tin, copper, lead, etc. The first processes in extracting metals from their ores are always more or less crude, and where they are desired in pure or nearly pure forms chemical or other means

must be resorted to in order to relieve them of the resulting impurities. See METALLURGY, ASSAYING, GOLD, SILVER, etc.

Reflecting Circle, in astronomy, etc., an instrument designed to measure angles by the reflection of light by means of plane mirrors of which it is the support. It differs from the sextant (q.v.) in that it is built upon a complete circle and not a part of it.

Reflecting Galvanometer, the most sensitive galvanometer yet invented, devised by Sir William Thomson for use in connection with the Atlantic submarine cables. A short needle is rigidly attached to a small concave mirror and suspended by a silk fibre in the centre of a vertical coil of small diameter. This mirror is adjusted by means of a directing magnet to throw the rays of a light (falling on the mirror through a hole having a fine wire stretched upright across it and placed just under the graduated scale opposite the mirror) back on the scale. An image of the wire is thus thrown on the scale, and the slightest motion of the needle and its mirror will produce a much greater motion of this image. Thus, as the current flows the one way or the other, the index will move to one side or the other.

Reflection. See LIGHT.

Reflector, the name of a device by which the rays proceeding from a luminous or heated object are thrown back or diverted in a given direction. The reflecting surface may be either plane or curved. In practice it is often made spherical or parabolic. The former does not bring the rays to a true focus, but is easily formed, and is consequently generally employed where extreme accuracy is not sought for. A mirror is a familiar example of a plane reflector. The material should be as smooth and highly polished as possible. Silver is the most perfectly reflecting substance known, absorbing but 9 per cent of the incident rays, while speculum metal absorbs 37 per cent. Glass itself, owing to its property of totally reflecting incident rays at a low angle, is used in certain cases.

Reflex Action, a non-voluntary reaction affecting a muscular apparatus in response to some kind of sensory stimulus. Such a reaction implies the traversing of the sensory stimulus to some nerve centre or centres in the brain, the medulla, or the spinal cord, and the setting free of a muscular response, general or local, to certain organs of the body, without the participation of willed conscious action, although consciousness of a reflex act performed may precede or accompany the act. Many of these reflexes are extremely intricate, so intricate in fact that certain philosophers have attempted to show that all life-processes are of the type of reflex actions. Many reflex actions, by reason of the fact that their muscular equivalent acts on blood-vessels, may increase or decrease glandular activity. Thus fright may destroy the ability of the stomach to digest. Dryness of the mouth is frequent as a result of certain forms of unconscious excitement, and many if not all of the emotions may be regarded essentially as intricate forms of vasomotor reflexes. Further reflexes are constantly operative and affect the normal metabolism of the skin or the bones, and still others are concerned in the general nervous equilibrium of the entire body—the so-

called neuromuscular tone. See CONSCIOUSNESS; EMOTION; MUSCLE-SENSE; NERVOUS SYSTEM; TELEPATHY.

Reform Acts, a term applied to certain acts of the British Parliament by which the regulations as to the parliamentary representation of the people were altered, and especially to those of 1832, 1867, and 1884-5. In the third successful effort for parliamentary reform, that of 1884-5, the franchise and redistribution of seats constituted two distinct acts. The franchise bill received the royal assent on 6 Dec. 1884, and came into operation on 1 Jan. 1885. It established household and lodger franchise in the counties, introduced a service franchise, and made a uniform occupation franchise of \$50 rent both in counties and in boroughs in place of the three formerly existing. It left untouched the 40-shilling freeholders of inheritance, and conferred votes on copy-holders possessing land of greater value than \$25 annually.

The great feature of the reform in representation was the separation of populous boroughs and counties into divisions, each returning a single member. England has now 465 members, Wales 30, Scotland 72, and Ireland 103, the reduction from 105 occurring through the disfranchisement of Sligo and Cashel some years ago for corruption.

Reformation, The. The Reformation is that movement in the 16th century which resulted in the division of Western Christendom into the Roman Catholic and Protestant Churches. Its principles, as set forth by Protestant writers, were in brief as follows: The Word of God is the final authority on all religious questions and is superior to tradition, the Pope, and the decision of general councils; a sinner is justified by faith alone. That is, he cannot obtain salvation by any amount of good works which he may accomplish, but is forgiven and saved through his faith in the work of Christ, the good works then following as a result not as a means of his salvation; a third principle is the universal priesthood of believers. This means that no mediator is needed between man and God except Jesus Christ and that all believers have direct access to Him, and that this power is not delegated to an exclusive priesthood.

For the beginning of this movement we must go back of the 16th century into the later Middle Ages. (See PROTESTANTISM.) The immediate occasion of the Reformation movement was Luther's (q.v.) controversy over the preaching of the indulgences in Germany granted by Leo X. to all who should contribute alms to the building of St. Peter's Church in Rome. Luther posted his 95 famous theses on the church door at Wittenberg 31 Oct. 1517. In these he claimed that the pope could not remit penalties beyond what he had himself imposed and also that his power did not reach beyond this life. Greatly to Luther's surprise the news of the posting of the theses quickly spread over Germany, and he found many to agree with him, but he desired only to reform certain abuses within the church, not to break away from it. But the efforts to bring about an agreement through discussion only revealed that his principles would logically carry him beyond the church. He declared the papacy a human institution, that the Council of

Constance had erred in condemning Huss and that some of the fundamental teachings of the Roman Catholic Church were erroneous.

In 1520 Leo X. excommunicated Luther, who burned the bull of excommunication and a copy of the canon law, thus cutting himself off from the papacy. The new Emperor Charles V. called Luther before the Imperial Diet at Worms the next year. Luther refused to retract any of the statements in his books unless convinced by the Bible or reason. He was placed under the ban of the Empire, that is, he was declared an outlaw. On his way home from the Diet he was taken by friends to the Wartburg, a castle belonging to the Elector of Saxony, and here remained in hiding, but not in idleness, because he busied himself with the translation of the Bible into the German of the common people. While here, extremists at Wittenberg were attempting to introduce radical reforms, and Luther returned in spite of danger and in a few days brought them to moderation, thus saving the Reformation from failure. The Reformation continued to spread through the efforts of many of the leaders in Germany, who were friendly to it and through the inability of Charles V. to give his attention to its suppression because of foreign wars. The Peasants' war (q.v.), which broke out in 1525, was ascribed by many to the teachings and position of Luther. The peasants, risen in rebellion against their rulers, believed that the time had come to strike for liberty and believed that Luther would help them, but he was opposed to their taking up arms, and the rising was put down with the loss of thousands of lives. This cost Luther many adherents and others were alienated by his marriage to a former nun in the same year. At each succeeding Diet an effort was made to come to some decision on the religious questions, but in vain. The best that could be done was the decision in 1526 to leave the matter to a general council, and until that should convene each state should use its own discretion. At the Diet of Spires in 1529, at which the Roman Catholic party was in the majority, the further progress of the Reformation was prohibited. The reformers protested against this action and received the name of Protestants. At the Diet of Augsburg in the next year the Protestants presented their confession of faith drawn up by Melancthon, and since known as the Augsburg Confession. Reconciliation between the two parties seemed to be out of the question, and the Schmalkaldic war broke out, ending in the victory of the Protestants and the Peace of Augsburg in 1555, by which the prince was to decide what should be the religion of the people under him, with this reservation that if an ecclesiastical prince should become a Protestant he must surrender his see.

A parallel but independent religious movement was in progress in Switzerland, under the leadership of Ulrich Zwingli. Born at Wildhaus and educated at Vienna and Basel, he came under the influence of the Renaissance and became a zealous student of the Greek Testament. Like Luther, he protested against abuses in the Church, inveighed against indulgences and tried to introduce reforms without separating from the Church. He preached at Einsiedeln and later at Zürich, with much

REFORMATION

power and attracted attention by his exposition of the Scriptures. His influence over the city government was so great that in 1523 he procured an order that the clergy of the city should preach nothing but what they found in the Scriptures and that images should no longer be used in the churches nor the sacrifice of the mass be celebrated, and in the place of the Roman Catholic forms of worship a simpler form, and as Zwingli believed, one more in accordance with the teachings and example of Christ took its place. This suggests one of the differences between Luther and Zwingli. Luther desired to keep as much as he could of the forms, ceremonies and doctrines of the Roman Catholic Church, making changes only where there seemed a direct opposition to the teachings of the Bible, while Zwingli desired to sweep away all additions and have nothing in form, ceremony or doctrine that was not directly sanctioned by the Scriptures. A conference was arranged between the two men at Marburg in 1529 that they might come to an understanding on the questions at issue between them, but on the Lord's Supper they could come to no agreement, Luther holding to the literal meaning of the words, "This is my body." The Swiss Reformation became involved in politics, and war broke out between the Catholic and Protestant sections, in which war Zwingli was killed and the Reformation in German Switzerland became of relatively little importance compared with the work which began in French Switzerland at Geneva. The way had been prepared by Farel, a bold and successful French Protestant preacher, who had been driven from his own country by persecution. He invited John Calvin, a refugee like himself, to assist him in the work at Geneva. He accepted and began his work in 1536, and with the exception of brief intervals spent his life there, making Geneva the theological centre of Protestant Christendom. He is the theologian of the Reformation and also a great organizer. His 'Institutes of the Christian Religion,' written when he was 27 years old and subsequently enlarged, though not essentially changed, clearly sets forth the doctrines of the Reformed Church and has great influence even to the present day. He organized the church at Geneva on the Presbyterian model, because he considered this the form of organization enjoined in the New Testament. In other ways he followed Zwingli rather than Luther, though taking a position between the two in regard to the Lord's Supper. His great influence in the Reformation movement is due to his influence on the many students and refugees who came to Geneva for instruction or safety and then carried his theological system and form of government back to France, Netherlands, England, Scotland and other parts of Europe.

When Luther began his work in Germany Francis I. was king of France and the rival of Charles V. and naturally inclined to favor a movement which might injure the German Emperor. He and his court were favorers of the Renaissance and did not object to a reform of the Erasmus type. After his death the reformatory movement, now rapidly growing, was vigorously persecuted. It became complicated with political issues, and the Huguenots, as the French Protestants were called, became a polit-

ical party. Catherine de' Medici, the queen-mother, with the aid of the Guises, planned and executed the massacre of the Huguenots on Saint Bartholomew's day, 24 Aug. 1572, in which Coligny, the foremost of the Huguenot leaders, was killed, and numbers of other Huguenots in Paris and the provinces. A religious war followed, which was not terminated till Henry of Navarre, the Protestant leader, gave up his faith and conformed to Roman Catholicism and secured toleration for the Huguenots in the Edict of Nantes 1598.

The Reformation quickly spread from Germany into the Netherlands through nearness, similarity in language and trade relations. Charles V. made severe laws against it, and these laws resulted in the execution of many of the Reformed faith. But he was personally popular in his home country, and there was no political party to oppose him as in Germany. When Philip II. became ruler, he made it evident that he not only would put down heresy, but proposed to rule as an absolute monarch in spite of their ancient privileges. Excessive taxes were imposed and the inquisition became more stringent. The people rallied around their nobles as leaders and revolted. Protestantism grew with great rapidity, especially in the north, but Philip resolved to subdue it, even if it meant the total extermination of the people. The best generals Spain could furnish were sent to put down rebellion and root out heresy, but these efforts were in vain. When the people could not defeat the Spaniards in open combat they cut the dikes and let in the sea. Under the guidance of their often defeated but never discouraged leader, William of Orange, the northern section, Holland, which had become almost wholly Protestant, accomplished their separation from the Spanish crown and the Roman Catholic Church. The southern part, Belgium, remained Catholic. Other countries in northern and southern Europe were affected by the Reformation. In Denmark, Sweden and Norway the Reformation was introduced by pupils of Luther and was generally aided by the authorities for advancing political interests. There was a lack of the enthusiasm which we note in northern Germany and the Netherlands, but the movement grew steadily through proximity to Germany, and these countries became and remained truly Protestant.

The Reformation extended to the south and east of Saxony into Bohemia, Poland and Hungary, carried by enthusiastic students from Wittenberg. Bohemia was prepared for such a movement by the previous labors of Huss, and here it spread rapidly. In Hungary and Poland with the Lutherans and Calvinists there were also Unitarian Protestants. The progress of the Reformation was greatly hindered by the inability of these three to work together, and their quarrels with each other. The Jesuits found this a rich field for their work in the second half of the century. Their work and the Thirty Years' war nearly annihilated the Reformation, so that Bohemia which at one time had not more than one ninth of its population adherents of the Roman Catholic Church is to-day almost wholly Catholic.

The Reformation in England was at first a personal and political revolt against the Pope rather than a religious movement. Henry VIII.

REFORMATORIES—REFORMED CHURCH

was a thorough Roman Catholic, but when the Pope refused to grant his request for a divorce he revolted against his authority, but remained essentially a Roman Catholic through his life with this exception that he did not admit the power of the Pope in England, so that this Reformation was largely negative. In the reign of Edward VI., 1547-53, there was a rapid movement toward the position of the continental Reformers, the most important events being the adoption of the Forty-two Articles as the creed of the church and the Book of Common Prayer in the English language to be used in the church service. These were both strongly Calvinistic. When Mary, the daughter of Henry VIII. and Catherine, became queen, her effort was to bring the Church back into the papal fold again and to punish the heretics. The nation through a pliant parliament returned to the Roman Catholic Church and the queen vigorously persecuted the Protestants. The leading Protestants, including Cranmer, archbishop of Canterbury, were burned at the stake, but Protestantism grew under the persecution which was ended by Mary's death in 1558. Her successor, Elizabeth, was a woman of great political shrewdness, but with little religious interest, and her effort was to make religious questions subservient to political problems. Her own preference was for a return to the relationship between church and state which existed in the reign of Henry VIII. Above all else she resolved to be supreme governor of the Church and would not tolerate those who refused to conform to the established worship. She persecuted the Puritans (as those were called who desired a form of worship stripped of the ceremonies and forms which came from the Roman Catholic Church and who refused to conform to her wishes), and also the Catholics. But she was unable to stop the growing spirit of dissent, which expressed itself in the rise of several religious parties. The Independents desired the entire separation of church and state and the independence of the local congregation. The Presbyterians thought that there should be the one state church but that it should be organized after the model of the New Testament churches which they considered Presbyterian. Still others would leave the state church as it was, only purified in form and ceremonies. The difficulty was handed down to Elizabeth's successors of the ill-fated Stuart line and reached a partial solution in the toleration act of 1689 in which the Episcopal Church remained the Established Church, but a limited freedom was given to the dissenters.

Closely connected with this was the Reformation in Scotland. Reformers from the Continent, especially from Geneva, preached and died at the stake. The leader of the work was John Knox (1505-72) who holds the position in Scotland which Luther has in Germany. He was a friend and pupil of Calvin and succeeded in establishing a church on the Geneva model in Scotland. Mary Stuart during her short reign tried to re-establish Roman Catholicism in Scotland, but found in Knox a strong and successful opponent. After the death of Knox his work was carried on by Andrew Melville.

Mention should be made of the partially successful efforts of the Roman Catholic Church to stem the tide of Protestantism and win back the

lost territory. The Inquisition was so thoroughly established and did such effective work in Italy and Spain that a promising Protestant movement in both countries was stopped. There was a reformatory work carried on within the Church. In Italy the Oratory of the Divine Love was organized whose object was the moral elevation of the Church. The Council of Trent by its discussions and decisions was a reformatory influence. By it the belief of the Roman Catholic Church was clearly defined and disciplinary reforms brought about. More important than all these was the work of the new semi-monastic order, the Jesuits, who through their missionary work succeeded in gaining many thousand converts to Catholicism.

Reformatories. See PENOLOGY.

Reformatory Schools, schools instituted for the training of juvenile offenders who have been convicted of an offense punishable by imprisonment. The first reformatory managed under legislative control was the one established in New York in 1824, known as the New York House of Refuge. Its success was so marked that at present there are 56 institutions in the United States for the reformation of juvenile offenders. Among them are a number of admirably conducted establishments under the control of religious denominations, to which children are sent, according to the religious creed of their parents, when the same can be ascertained.

Reformed Church. See CALVINISM; DUTCH REFORMED CHURCH; REFORMATION.

Reformed Church in the United States, The, formerly known as the German Reformed Church in the United States of America and an off-shoot of the Reformed Church of Germany. The first minister was the Rev. George Michael Weise, who emigrated with about 400 people of the Palatinate in 1727, and settled in Pennsylvania. In 1746 the Rev. Michael Schlatter was commissioned by the synods of North and South Holland to visit their German missions in America, and regulate their relations. He assembled in Philadelphia the first synod or *coetus* of the German Reformed Church 1747. The German Reformed *coetus* continued under the jurisdiction of the Church of Holland till 1793, when an independent synod was formed. It increased rapidly in membership and congregations. The first triennial general synod, with jurisdiction over the whole Church, met in Pittsburg 1863. The gen-

eral synod of 1869 resolved to drop the word "German" from the title of the Church. The Heidelberg catechism is the only standard of doctrine. The worship of the Church is liturgical; its government is presbyterian. Reception into the full communion of the Church takes place by the rite of confirmation. Christmas, Good Friday, Easter, and Whitsunday are observed with much solemnity. Eleven English and five German papers are published in the interest of the Church; and there are 16 theological and literary institutions under its control. Statistics, 1900: Churches, 1,660; ministers, 1,082; members, 243,545.

Reformed Episcopal Church, a denomination organized by members of the Protestant Episcopal Church, who give substantially the following statement of the events and circumstances which, as they believe, justify their course: (1) The Protestant Reformation in England had outwardly a political origin (in the act of the king, Henry VIII., renouncing allegiance to the pope, and proclaiming himself head of the English Church); by which the work was biased and cut short. During the brief life of the young king, Edward VI., the regent, or protector, being in favor of the Reformation, great progress in it was made. Under Mary the supremacy of the pope was again acknowledged. When Elizabeth became queen, wishing to harmonize her divided subjects, and hoping for reconciliation with Rome, she strove to have the liturgy framed so as to satisfy both parties. Consequently it contained contradictory elements. At a later period, when she had found her hope futile, the articles of faith adopted were decidedly Protestant. Thus it came to pass that in the Church of England two parties found support in her ritual; the one Protestant, the other having an affinity with Rome. (2) After the American Revolution, when the Church of England in the colonies became the Protestant Episcopal Church of the United States, the Book of Common Prayer, having been adopted without material alterations, retained its conflicting elements. (3) The Tractarian movement, which began at Oxford, 1833, was a successful endeavor to revive the principles of antiquity and Catholicity contained in the Prayer Book, in opposition to its Protestant elements. It discarded Protestant principles and taught the doctrines of apostolic succession, priestly absolution, baptismal regeneration, the real presence, and the authority of the Church. (4) These teachings produced a powerful effect in the United States also. A great increase in ritualism, and of the drift toward Rome, was soon manifested; the opposition between the "High" and the "Low Church" parties was intensified, and practical measures were adopted by each which widened the chasm. (5) Several subsequent public events fanned the flame of discontent, especially the censure of one clergyman for preaching in a Methodist church, and the suspension of another for omitting the word "regenerate" in the baptismal office. (6) Remonstrances and petitions for relief, which were numerous and urgently presented to the General Convention, produced no effect. (7) During the sessions of the Evangelical Alliance in New York in October 1873, Bishop Cummins of the diocese of Kentucky, having, by invitation, officiated at a union celebration of the Lord's Supper, in com-

pany with representatives of other denominations, was for this act of Christian fellowship bitterly censured through the press by members of the High Church party. After this, convinced that he could no longer rightfully continue in a Church whose theory and practice (as interpreted by the majority of its members) denied the brotherhood of believers in Christ, Bishop Cummins withdrew from the ministry of the Protestant Episcopal Church. (8) This led to the organization in 1873 of the Reformed Episcopal Church, of which Bishop Cummins and the Rev. Dr. Charles E. Cheney were elected bishops. At the same time the following declaration of principles was adopted: I. The Reformed Episcopal Church "holding the faith once delivered to the saints" declares its belief in the Holy Scriptures of the Old and New Testaments as the Word of God, and the sole rule of faith and practice; in the creed "commonly called the Apostles' Creed"; in the divine institution of the sacraments of baptism and the Lord's Supper; and in the doctrines of grace substantially as they are set forth in the Thirty-nine Articles of Religion. II. This Church, recognizes and adheres to Episcopacy, not as of divine right, but as a very ancient and desirable form of Church polity. III. This Church, retaining a liturgy which shall not be imperative or repressive of freedom in prayer, accepts the Book of Common Prayer, as it was revised, proposed, and recommended for use by the General Convention of the Protestant Church, 1785; reserving full liberty to alter, abridge, enlarge, and amend the same as may seem most conducive to the edification of the people, "provided that the substance of the faith be kept entire." IV. This Church condemns and rejects the following erroneous and strange doctrines as contrary to God's word: (1) That the Church of Christ exists only in one order or form of ecclesiastical polity. (2) That Christian ministers are "priests" in another sense than that in which all believers are "a royal priesthood." (3) That the Lord's table is an altar on which the oblation of the body and blood of Christ is offered anew to the Father. (4) That the presence of Christ in the Lord's Supper is a presence in the elements of bread and wine. (5) That regeneration is inseparably connected with baptism. To this statement it may be added that in this Church the bishops do not constitute a separate order, but are presbyters; in council they vote with and as their brother presbyters, and are subject to confirmation or appointment by the general council. Statistics, 1900: Churches, 104; ministers, 103; members, 9,743.

Refraction, a deviation in the course of a ray of light when it passes through the surface of a transparent medium. A familiar result of refraction is seen when one looks very obliquely into a transparent pool of water, of which the bottom is visible. The water seems much shallower in such a case than it really is. Another example is the bent appearance of the oars of a boat when the blades are seen obliquely

REFRACTION

under water. When ordinary light is refracted, it is also decomposed into light of the various elementary colors. This decomposition is due to the unequal refraction of light of different wave-lengths; and the resulting separation is known as *dispersion*. It is too small to be noticed in ordinary cases, such as those we have already cited. But, on looking at a source of light through a glass prism, it is very evident. See LIGHT; SPECTRUM.

The general theory of refraction is quite simple, and may be expressed in the following way: The power of a transparent medium to refract a ray of light is expressed by a certain

FIG. 1.

number called its *index of refraction*. The phenomenon of dispersion shows that this number is different for rays of different colors, or wave-lengths. It is generally greater the denser the medium; but to this rule there are many exceptions. The mathematical principle by which the amount of refraction is determined is as follows: Let AB represent the surface of a transparent medium, LM. Let a ray of light, PQ, strike this surface obliquely at Q and enter the medium, and let QR be its course through the medium. Draw through Q the perpendicular DE. Then the angle PQD which the ray makes with the perpendicular before it enters the medium is called the *angle of incidence*; and the angle EQR which it makes after entering the medium is called the *angle of refraction*. The law of refraction then is:

For one and the same medium, and the same ray of light, the ratio of the sine of the angle of incidence to that of the angle of refraction is a constant quantity for the same medium and the same ray.

This constant ratio is called the *index of refraction*. The law may be expressed in algebraic language as follows: Put

- I, the angle of incidence;
- R, the angle of refraction;
- n , the index of refraction.

Then we shall have

$$n = \frac{\sin I}{\sin R}$$

or,

$$\sin R = \frac{\sin I}{n}$$

It is a law of the course of light that, if a ray passes in the opposite direction, say from R to Q, it will continue on the line QP after leaving the medium. It follows if the ray

PQ emerges from the medium at R it will suffer refraction according to the same law as a ray entering it, but in the reverse direction. Hence if the lower surface of the medium is parallel to the upper surface, the emerging ray RS will be parallel to PQ.

One result of the above law is that a ray entering or leaving a medium in a direction perpendicular to the surface of the latter will undergo no refraction, but will continue in the same straight line. In this case the angles of incidence and refraction are both zero.

From the above equation we find that, if the angle R and the index of refraction are given, we can find the angle of emergence by the equation

$$\sin I = n \sin R.$$

Now, the angle R may be so large that this expression is greater than 1. Then there will be no possible value of the angle of emergence to fulfil the condition. It is found that, in this case, the ray will not emerge from the medium at all, but will be reflected from its inner surface as if the latter were polished and opaque. This is called *total reflection*, and is frequently applied in optical instruments. An example will show how this result may be brought about. Let ABC, Fig. 2, be the section of a glass prism, the angle at C being a right angle. Let a ray enter the prism at the point Q in a direction perpendicular to the surface BC. It will then pass on and will reach the lower surface of the prism at the point R. The angle DRQ will then be 45 degrees. The sine of this angle is 0.707 +.

FIG. 2.

Now, a glance at the table which follows will show that in all sorts of glass the index of refraction is greater than 1.5. It follows that the sine of the angle at which the ray QR should emerge from the prism would be greater than 1.5×0.7 , and therefore greater than 1. There is then no possible angle to fulfil the conditions. The light is therefore reflected in the direction RS, as though the surface AB were perfectly opaque and highly polished.

Indices of Refraction of Various Substances.

— Any one definite chemical compound has, at a given temperature, always the same index of refraction for the same ray. But glass is not such a compound, because its ingredients differ in different specimens of glass. It is impossible to make two pots of glass so exactly alike that they shall have the same index of refraction. It is owing to this fact that the idea frequently entertained, of making a telescope by putting together different pieces of glass, is impracticable.

REFRIGERATION AND REFRIGERATING MACHINERY

cable. The following table shows the indices for a number of common transparent substances, and for three of the principal rays, C, D, F. It will be seen that glass has a greater refracting power than water; and that plate glass is more refracting than crown. The diamond is the substance which has the greatest refracting power of all. It has also a great dispersive power; and it is owing to this fact that a diamond with polished faces shows so many brilliant colors when a ray of light falls upon it.

TABLE OF INDICES OF REFRACTION.

| | Ray C | Ray D (mean) | Ray F |
|------------------------|----------|-----------------|----------|
| Soft crown glass.... | 1.511910 | 1.514580 | 1.520994 |
| Medium crown glass.. | 1.513558 | 1.516149 | 1.522343 |
| Hard crown glass.... | 1.514571 | 1.517116 | 1.520994 |
| Light flint glass..... | 1.537682 | 1.541022 | 1.549125 |
| Medium flint glass.... | 1.575903 | 1.579880 | 1.589870 |
| Dense flint glass..... | 1.645773 | 1.651242 | 1.664981 |
| Rock salt | 1.54050 | 1.54418 | 1.55324 |
| Iceland spar | 1.65435 | 1.65833 | 1.66780 |
| Rock crystal | 1.54190 | 1.54424 | 1.54970 |
| Fluor-spar | | 1.4339 | |
| Canada balsam | 1.528 | | |
| Diamond | | 2.470 | |
| Ice | 1.306 | | |
| Quartz | | 1.5442 | |
| Water | 1.3307 | 1.3324 | 1.3366 |
| Carbon sulphide..... | 1.6240 | 1.6333 | 1.6584 |
| Air | 1.000290 | 1.000292 | 1.000294 |

The refractive power of a substance is different at different temperatures. As a general rule, glass refracts more the colder it is. Consequently the focal length of a telescope will generally be slightly shorter the colder the weather. The difference is, however, slight and there are exceptions to the rule.

Refraction by the Atmosphere.—It will be seen by the preceding table that air has an appreciable, though slight, refracting power. It follows that a ray of light coming from a star is gradually bent toward the perpendicular as it approaches the surface of the earth. Only when a star is in the zenith does the ray suffer no refraction. The result is that astronomical observations upon the declination or altitude of a heavenly body require to be corrected for refraction. The latter, depending upon the density of the air, is greater the colder the air and the higher the barometer. Hence the astronomer has always to record the readings of his thermometer and barometer when he observes the altitude of a heavenly body. A rough approximation to the amount of the refraction can be made by the rule that, at small zenith distances it is nearly 1" for each degree of zenith distance; and that, if the altitude is not greater than 45°, it increases nearly as the tangent of the zenith distance. The rate of increase is somewhat less than that given by this law, but still the refraction increases rapidly as we approach the horizon, where it usually amounts to about 35'. This is greater than the diameter of the sun or moon. It follows that, when we see the lower limb of the sun just touching the horizon at sea, the luminary is actually entirely below the horizon. Moreover, the lower limb is elevated more by refraction than the upper one, with the result that a certain ellipticity is produced in the apparent outline of the sun, which is plainly perceptible to the naked eye.

A ray of light always suffers refraction when passing through the air in any other than a ver-

tical direction, and its course is most curved when it is horizontal. In this case the curvature under ordinary conditions of the air is about 1/6 that of the earth. But this result depends entirely at the rate of increase or diminution of the temperature as we rise above the ground. If the air is very cold near the ground, and rises rapidly in temperature above it, a horizontal ray may be more curved than the earth, and strike the latter at some point. Objects may then be seen at such a distance that they are far below the horizon, as was once noticed by an Arctic navigator who, when separated from one of his ships, saw her image upside down above the horizon and, sailing toward it, found the ship. In the contrary case, when the air near the ground is much warmer than at a small height above it, the reverse effect is produced. A horizontal ray is then refracted upward so as not to strike the earth at all. It is through this action that the mirages, so frequent in the desert and elsewhere, are produced. See MIRAGE.

S. NEWCOMB.

Refrigeration and Refrigerating Machinery. Refrigeration is the operation of cooling substances by artificial means. Natural ice forms the greatest source of refrigeration, but there are certain conditions where cold produced through mechanical means possesses advantages over natural ice, which have led to the development of a number of refrigerating machines. The advantages of mechanical refrigeration over that produced by natural ice are that the temperatures of the objects cooled can be more readily regulated, lower temperatures can be obtained, and in many cases the desired cooling effect can be secured at a lower cost. Refrigerating machines are used in cold storage warehouses, and allow the temperatures of the rooms to be readily adjusted so that their contents are either frozen or held at temperatures slightly above the freezing point. They are extensively used in various manufactures such as brewing. There are also numerous plants for the production of artificial ice, which possesses hygienic advantages over natural ice when used in such a way as to bring it in direct contact with food or drink, in that it may be made free from bacteria; whereas the natural ice holds those originally in the water without destroying them. Many bacteria can even withstand the extreme cold produced by liquid air of about 300° F. below zero without losing their vitality.

Ice as a Refrigerant.—With the present mode of life ice is a domestic and commercial necessity. And yet the extended use of ice in many fields is of comparatively recent origin. Nero had ice houses constructed in Rome, and ice houses for storing natural ice have been in use for centuries, yet it is but a short time since refrigerating cars have made it possible to ship Western beef to New York and the fruits of California to any part of the United States.

Ice-making.—The production of artificial ice. The heat is usually abstracted from the water to be frozen by evaporating a volatile liquid, such as ammonia, sulphur dioxide, or ether, which in evaporation absorbs heat. Anhydrous ammonia is most commonly employed. This boils at 27° F. below zero at atmospheric pressure. If the anhydrous liquid ammonia is

REFRIGERATION AND REFRIGERATING MACHINERY.

REFRIGERATION AND REFRIGERATING MACHINERY

introduced in a coil of pipe which is placed in a tank of brine it will absorb heat from the brine during the process of boiling equal to the latent heat of evaporation. If a can of water is immersed in the brine it will in turn be cooled and then frozen, and this process constitutes the elements of the Can System of ice-making. If on the other hand, the ammonia in the coil is made to cool a flat plate forming the vertical side of a water reservoir ice will be formed directly on the plate, and this constitutes the elements of the Plate System of ice-making. The vapor produced when the liquid ammonia evaporates in the coil, is, in all cases, again converted to the liquid state so that it may be used over again. In abstracting heat from the refrigerating coil the vapor is at a low pressure, say 15 pounds per square inch above the atmosphere at which the boiling point of the liquid is 0° F. To convert it to a liquid it must be raised in pressure, to say 140 pounds per square inch above the atmosphere, at which the boiling point of the liquid is 80° F. As the temperature at the boiling point of a vapor is the same as that at the condensing point, the vapor at 140 pounds pressure can be condensed by cooling it to 80° F., and after such condensation it may be returned to the refrigerating coils and used over again for abstracting heat from the brine. To raise the pressure of the gas from 15 pounds to 140 pounds per square inch we may employ either of two methods—compress it by means of an engine, or we may absorb the vapor in cold water and then heat the aqueous solution of ammonia in a still, and so drive the gas off at high pressure. These two methods of compression constitute the distinguishing features of what is called the compression and absorption systems of ammonia refrigerating machines.

In the can system of ice-making, distilled water which has been freed of air is ordinarily used for freezing and this produces a cake of transparent and clear ice with the exception of a thin feather of air bubbles in the centre of the cake and a portion of the top of the cake which is white where the water expands over that first frozen. A cake of ice made by the can system is shown in Fig. 1. The distilled water from which ice is made is obtained by condensing the exhaust steam from the engine of the refrigerating machine and by condensing live steam. In an economical plant the steam required to run the engine and for other purposes is less than the amount of ice produced, and to make up the difference some live steam is admitted directly to the condenser in order to supply the necessary amount of distilled water. In an ice-making plant where the water is distilled by evaporating it in an ordinary boiler, the weight of ice made per pound of coal is, therefore, limited by the evaporation of the boiler and the amount of ice produced is less than the total amount of steam generated by what is lost through the drips from the steam pipes and other causes. It is possible, therefore, to make more ice per pound of coal by the plate system of ice-making where the water is not distilled than it is by a can system as ordinarily operated. In an economical compression plant where the ice is made by the can system a single cylinder engine working without a vacuum will require less steam to run it than the weight of ice which

is produced, and if distilled water is used for freezing it will not increase the efficiency to employ a more economical engine. In a plate system, however, a compound engine may be used with a corresponding gain in the efficiency.

In order to make it possible in a can system to make a greater amount of distilled water ice than the weight of water evaporated by the boiler it has been proposed to use multiple-effect evaporators for distilling the water. This was done in a plant at Newark, N. J., but the system had to be abandoned on account of the evaporator becoming coated with a hard scale which was deposited from the water to such an extent that the evaporator soon fell off in its capacity and efficiency. Where the steam from the engine operating the refrigerating machine is condensed in order to obtain distilled water for making the ice, the oil which this water contains must be eliminated. This is accomplished by re-boiling the water which comes from the condenser in an open tank by means of a jet of live steam; then cooling and running it through an oil separator and finally through charcoal filters. Re-boiling the distilled water removes the air which it may contain. It is possible to so thoroughly remove the oil that there will be no traces of it in the ice, whereas, if this is done imperfectly, the centre of the cake, when freshly broken open, will have a slight smell resembling that of tar. The presence of a trace of oil can be detected by the odor when it cannot be detected by taste. In the plate system the ice is formed on the flat cooling surface to the depth of about 6 inches in 2 days, 9 inches in 4 days, and 12 inches in 7 days. The plates on which the ice is frozen are about 10 by 14 feet in area. A cake of ice which has just been drawn or harvested from the tank of a plate system is shown in Fig. 2. The plates are usually allowed to build up to about 12 inches thick before harvesting. They are then melted free from the cooling plate by passing hot ammonia gas under pressure into the cooling coil which by condensation supplies the necessary heat. After this the blocks of ice are cut to the size required by sawing or by a parting tool heated by steam. In some plate systems cold brine instead of ammonia is circulated through the cooling coils. In the plate system the water in contact with the freezing plates is agitated by means of compressed air which is admitted from a perforated pipe placed near the bottom of the tank. As the ice freezes from one side only it forces the impurities and the air contained in the water to its surface, and the circulation produced by the air bubbles floating upward through the water assists in removing the impurities and air bubbles from the surface. A clear transparent ice is thus produced.

The results of tests of a can and a plate system of ice-making are given in Table I., which follows. The test of the can system was made by Messrs. Hupfel, Griswold and Mackenzie of the class of 1893 of the Stevens Institute of Technology as a graduation thesis. The plant was that of the Hygeia Ice Company, New York. The tests of the plate system were made by Messrs. Warner, Moore, Hunt, and Quick of the class of 1904 of the Cornell University as a graduation thesis, the tests being made on the plant of the Diamond Ice Company at Wilmington, Del.

REFRIGERATION AND REFRIGERATING MACHINERY

TABLE I.—RESULTS OF TESTS OF TWO ICE-MAKING PLANTS, ONE USING THE CAN SYSTEM AND THE OTHER THE PLATE SYSTEM.

| | Can system | Plate system |
|---|-------------------|-----------------|
| Fuel used*..... | Buckwheat and pea | Bituminous coal |
| Type of engines driving compressors..... | Simple | Compound |
| Total ice made per pound of coal as fired..... | 7.28 | 11.02 |
| Percentage of ice lost in removing from cans or in harvesting and cutting..... | 2.2 | 12.0† |
| Net ice made per pound of coal as fired in pounds..... | 7.12 | 9.79 |
| Total ice in pounds per hour per horse-power of steam cylinder..... | 38.6 | 37.9 |
| Net ice manufactured per day in tons of 2,000 lbs., compressors of can system running 12 hours per day, and of plate system 24 hours per day..... | 97 | 109 |
| Average pressure of ammonia gas at condenser in pounds per square inch above the atmosphere..... | 135.2 | 118.6 |
| Average back pressure of ammonia gas in pounds per square inch above the atmosphere..... | 15.8 | 9.1 |
| Pounds of water evaporated at boilers per pound of coal..... | 8.085 | 8.02 |
| Total horse-power developed by compressor engines..... | 444 | 274 |

APPROXIMATE DIVISION OF STEAM IN PER CENTS OF TOTAL AMOUNT.

| | | |
|--|------|------|
| Compressor engines..... | 60.1 | 69.6 |
| Live steam admitted directly to condensers..... | 19.7 | 0 |
| Steam for pumps and auxiliaries..... | 7.6 | 25.1 |
| Live steam for re-boiling distilled water..... | 6.5 | 0 |
| Steam for blowers furnishing draft at boilers‡..... | 5.6 | 0 |
| Steam for dynamo engines‡..... | 0 | 2.9 |
| Steam for removing ice from cans and for harvesting and cutting the ice..... | 0.5 | 2.4 |

*The calorific value of the coal used in the two tests was about the same.

†This loss is excessive and with a proper system of cutting could readily be reduced to about one half, which would make the net produced per pound of coal 10.4 pounds instead of 9.7 pounds.

‡The blowers and dynamo engine are not necessary adjuncts to the ice-making plants, and the steam used by them should be eliminated from the comparison. One of the items tends to counterbalance the other, however, so that the comparative figures for the performance of the two plants are fair ones.

In the so-called vacuum ice-making machines water is used as a working fluid, and it is cooled to the freezing point by its own evaporation. In these machines the water is injected into a refrigerating chamber in which a vacuum is maintained and a portion of the water is frozen by the cooling effect produced by the evaporation. In some machines the vacuum is maintained entirely by mechanical means and in others by the combination of an air pump and a reservoir of strong sulphuric acid for absorbing the water vapor. Where acid is used it is heated after it has become weak through the absorption of water vapor and after concentration is returned to the machine and used over again as an absorbent. Where a vacuum is maintained entirely by mechanical means a very large cylinder displacement is required in the

air-pump. One machine constructed on this principle had a cylinder 20 feet in diameter and a stroke of 10 feet, and made 20 double strokes or revolutions per minute. The ice produced is white, opaque and hard. It is produced in large cakes and cut by a saw to the size required for commercial use.

Ammonia Compression System with Brine Circulation.—Fig. 3 shows a compression system for a cold storage warehouse. A is the compressing cylinder which is driven by the steam engine B. The gas on being compressed in A passes up through the pipe *aa* to the condenser C, where it is liquefied. The liquid anhydrous ammonia passes from the condenser through the pipe *bb* to the liquid ammonia reservoir D. From the reservoir D the liquid ammonia passes through the valve E, termed "the expansion cock," where it is reduced in pressure from say 140 pounds per square inch above the atmosphere to a pressure of say 15 pounds per square inch above the atmosphere, and thereby is reduced in temperature from about 80° F. to about 0° F. The anhydrous ammonia at a temperature of about 0° F. flows in coils of pipe in the brine cooling tank F, and abstracts heat from the brine by being evaporated. The gas produced by the evaporation of the ammonia passes from the condenser coils through the pipe *cc* to the compressing cylinder A, where it is again compressed and returned to the condenser. The brine which is reduced in temperature in the cooler F is pumped by means of the pump G through the pipes *dd*, which are connected with coils HH in the cooling rooms II. After the brine has passed through the cooling coils it is returned to the cooler F. In passing through the expansion cock E about 10 per cent of the weight of the anhydrous ammonia will be vaporized and it is the heat required to produce this vaporization that causes the liquid to be reduced in temperature from say 80° F. before throttling to 0° F. after throttling. Ninety per cent of the ammonia is, therefore, in the liquid state when it has attained the temperature of ebullition corresponding to the pressure existing in the cooler. The brine in the cooler is at a slightly higher temperature than the liquid ammonia contained in the coils and transmits heat to it so as to boil it and convert it into gas. The brine in parting with its heat is thus cooled to the extent of the heat required to evaporate 90 per cent of the liquid ammonia which passes through the throttling cock. In some types of compression machines all of the ammonia is not allowed to vaporize in the cooler, whereas in other systems care is taken to secure a complete evaporation. This gives rise to two classes of machines, one of which is known as the wet or cold compression and the other as the dry compression system. The brine returns to the cooling tank after passing through the storage rooms at about 6° higher temperature than that at which it leaves the cooler and the mean temperature of the brine is about 10° higher than the boiling point of the ammonia corresponding to the suction-pressure. The mean temperature of the brine is 6° less than that of the air in the storage rooms. For the storage of beer a temperature of about 36° F. is required, and this is secured with a pressure of about 28 pounds per square inch above the

REFRIGERATION AND REFRIGERATING MACHINERY

atmosphere in the coils of the cooler. Slaughter houses require about 25° F. in their storage rooms, which must be obtained by a pressure of about 22 pounds per square inch in the cooler. The storage of fish requires a temperature of about 0° F., for which a pressure in the brine coils of the cooler of about 5 pounds per square inch above the atmosphere must be used. Instead of a brine made with ordinary salt one formed from chloride of calcium is often used as a circulating medium because it produces less corrosion in the pipes than salt brine and may be brought to a lower temperature before it freezes or becomes partly congealed. In another system air is blown around the coils of the cooler and is circulated through the storage rooms, and a chamber freshly filled with material can be more quickly cooled than by the use of cooling coils. The air system appears to be more expensive to operate than the brine system.

Direct Expansion Systems.—In some machines instead of expanding the ammonia in coils placed in the cooler and forcing cold brine through the coils in the refrigerating rooms the anhydrous ammonia is expanded directly in coils placed in the refrigerating rooms. In this system we eliminate the loss due to the difference in temperature between the brine and the coils in the cooler. The use of brine is, however, regarded by many as a safeguard against dam-

cylinder is about 100° F. higher than this, and if the cylinders were non-conductors of heat the wet process would be more economical than the dry. It appears by tests, however, that the influence of the conductivity of the cylinder walls in abstracting heat in one part of the cycle and giving it back in part in another, makes the two systems about equal in economy.

Ammonia Absorption System.—As has already been explained, the essential difference in an absorption machine and a compression machine consists in the method of increasing the pressure of the ammonia gas leaving the refrigerating coils. For the compressing pump and the steam-engine in the compression system there is substituted a vessel called an absorber, and a pump for pumping the liquid into a steam still. The condenser, liquid ammonia reservoir, expansion cock and cooler are the same in the two systems. A section of an absorption refrigerating machine is shown in Fig. 4. A is the still or generator in which the aqueous ammonia is heated in order to drive off the gas. The ammonia gas passes off through the pipe *aa* to the rectifier B, where the gas is cooled to a point where any water vapor in it will be condensed. The ammonia gas free from water vapor passes to the condenser C, where it is condensed and passes through the pipe *bb* to the ammonia reservoir D. From the reservoir D the liquid ammonia passes through the valve,

FIG. 3.

age to the material in the store room by the accidental escape of ammonia from the circulating pipes; the brine circulation is for this reason much used, notwithstanding the fact that the cost of the piping is less for the direct expansion system and that there is a saving in the cost of operation. This saving is due to dispensing with the brine circulating pump and permitting from 5 to 10 pounds higher pressure to be used in the coils of the cooler. In the wet system of compression, known also as the Linde system, the presence of liquid ammonia in the compression cylinder limits the highest temperature attained by the ammonia during compression to the boiling point of the ammonia liquid corresponding to the highest pressure, or say to 80° F. With the dry system of compression the maximum temperature in the compression

or expansion-cock E, into a refrigerating chamber or cooler F, where it is evaporated through heat supplied by the coils contained therein through which a calcium chloride brine is circulated. The cold brine is circulated through the pipes *dd* to and from coils in the cold storage rooms. The ammonia gas leaves the cooler through the pipe *cc* and enters near the top of the absorber J, where it meets a spray of weak ammonia liquor, which is conducted to it through the pipe *ce*. The ammonia gas is taken up by the weak ammonia liquor in the absorber and forms the strong liquor which leaves the absorber through the pipe *ff* and is forced by the pump K through the pipe *ll*, the exchanger L and the pipe *mm* into the top of the generator, thus completing the cycle. Heat is given off by the ammonia on absorption, which is taken

REFRIGERATION AND REFRIGERATING MACHINERY

up by water circulated through coils contained in the absorber. The exchanger L saves heat which would otherwise be lost, and thus increases the efficiency of the machine. The weak liquor on leaving the generator is at the highest temperature at which the aqueous ammonia is brought in the system, whereas the strong liquor leaving the absorber is at the lowest temperature. It is necessary to cool the weak liquor before it enters the absorber and to heat the strong liquor to the temperature of the generator, and this is accomplished, in part, by the exchanger by making the weak liquor heat the strong liquor and the strong liquor cool the weak liquor. The weak liquor at about 270° F. is taken off near the bottom of the generator and passes through the pipe *nn* to the top of the exchanger L and thence through a coil contained therein. From the bottom of the exchanger it passes through

pipe *rr*. The water vapor condensed in the rectifier together with the ammonia which it carries with it is returned to the analyzer by means of the pipe *ss*. The drip water from the generator coil is discharged through the steam trap N.

Comparison of Ammonia Compression and Absorption Systems.—Tests have shown that the economy of a compression system when driven by an engine requiring 3 pounds of coal per hour per indicated horse-power is about equal to that of the best absorption system when used in connection with a boiler of good efficiency provided the suction pressure of the ammonia gas is about 20 pounds per square inch above the atmosphere—that is when the temperature of the substance to be refrigerated is about 20° F. For higher temperatures and higher suction pressures the compression machine is more economical in fuel, and for lower temperatures

FIG. 4.

the pipe *ee* to the absorber J. The strong liquor at about 130° F. passes through the exchanger L in the reverse direction to that of the weak liquor, and the interchanging of heat is such that the weak liquor leaves the exchanger say 100° F. cooler than it entered and the strong liquor is heated a corresponding amount. The strong liquor is made to enter the top of the generator and pass through what is called an analyzer M. The analyzer adds to the efficiency of the generator by causing the strong liquor to meet the outgoing gas generated at the bottom of the still. An exchange of heat takes place, which causes much of the ammonia contained in the strong liquor to be driven off at a lower temperature than that which exists at the lower part of the still and produces ammonia gas more free from water vapor than could be secured if the strong liquor were introduced into the lower part of the still. The cooling water passes first through the condenser C, entering through the pipe *oo* and from thence to the absorber J through the pipe *pp*. It finally leaves the absorber through the pipe *qq*. Heat is supplied to the generator by means of steam which enters a coil contained therein through the

the absorption machine is more economical, unless the compression system employs a multiple expansion engine so as to reduce the coal consumption below the 3 pounds on which this comparison is based.

Other Compression Systems.—Water, sulphuric ether, sulphur dioxide, carbonic acid, methylic ether, and certain petroleum products may be used in compression systems in the same way as ammonia. In the case of water temperatures colder than 32° F. require a suction pressure of within .08 pound per square inch or 0.16 of mercury of a perfect vacuum. The dimensions of a compressor cylinder of such a plant is about 150 times that for ammonia. The use of water as a working fluid is, therefore, impracticable except for the production of ice as described under *Ice-making*. Sulphuric ether was the first substance practically applied to refrigeration by the compression system. The volume of the compressing cylinder is, however, about 17 times that required for ammonia, and its use has, therefore, been abandoned. Sulphur dioxide machines produce a temperature of about 5° F. in the cooler with a suction of about 3 pounds below, and a condenser-pressure

REFRIGERATION AND REFRIGERATING MACHINERY

about 35 pounds per square inch above the atmosphere. Their economy is about the same as with ammonia, but the compressing cylinder must be about 3 times as large as for ammonia. The Pictet system uses sulphur dioxide, and in some cases what is called the Pictet fluid, which is sulphur dioxide mingled with about three per cent of carbonic acid. Carbonic acid gives a temperature of 5° F. in the cooler with a suction-pressure of about 330 pounds per square inch above the atmosphere and a condenser pressure of about 900 pounds per square inch. The fuel required is more than with ammonia, but the size of the compressor cylinder is about one fourth that required for ammonia. Carbonic acid is used only to a limited extent; but the compactness of the machine employing it, together with the fact that any bursting of a pipe or leakage will not lead to the same disastrous results as with ammonia, renders it more suitable for service on ships and also in some other special lines of work. Nothing definite is known of the economy of the few machines which have used methylic ether and petroleum products. From the physical properties of these substances it would appear that they would give about the same economy as ammonia or sulphur dioxide.

Water Absorption System.—The absorption system may be applied to water or brine as a refrigerating substance and sulphuric acid as an absorbent as mentioned under *Ice-making*. The water or brine is fed into a chamber, where a vacuum within at least 0.16 inch of mercury of a perfect vacuum is maintained by an air-pump. A portion of the liquid evaporates, and temperatures as low as 14° F. may be obtained with brine. The unevaporated liquid is frozen if it is water, or is circulated through the spaces to be refrigerated if it is brine. The water vapor produced through evaporation in the cooling chamber is passed into a vessel containing strong sulphuric acid, which absorbs it, and finally becomes diluted. The diluted acid is pumped into a still or generator, where it is heated and converted to a strong acid, which is used again in the absorber. This method was employed in one of the oldest forms of ice-making machines where a vacuum was produced in a glass bottle or caraffe filled with water and ice was formed inside the bottle for table use. Other substances having a strong affinity for water may be used in place of sulphuric acid. About one fourth of the water is vaporized and the remaining three fourths is converted into ice.

Air as a Refrigerant.—When air at ordinary pressures is used as a refrigerant, the expansion cock marked E in Figs. 3 and 4 must be replaced by a cylinder and piston in which the air in expanding can be made to do work. If air at say 100 pounds pressure above the atmosphere is allowed to enter the cooler through the expansion cock, there would be practically no refrigeration produced. The reason for this is that air at ordinary pressures behaves like a perfect gas. To lower the temperature of the air to any material extent it must be made to do work against a piston. An expanding as well as a compressing cylinder must therefore be provided. The work done by the expanding cylinder may be made to help drive the com-

pressing cylinder. In an air machine having a condenser pressure of 45 pounds per square inch above the atmosphere the volume of the compressing cylinder would be about 20 times that required by an ammonia machine, and the temperature of the air on leaving the expansion cylinder would be about 50° F. below zero. The consumption of fuel for a given refrigerating effect would be about 6 times that of ammonia. If instead of using air at atmospheric pressure a closed system is used, so that the pressure on entering the compression cylinder is about 40 pounds per square inch above the atmosphere, the volume of the compressing cylinder is reduced to about 6 times that required for ammonia, but the economy is about the same as where the air is used at atmospheric pressure. Air machines are used extensively on ships because the use of air does not involve the risk of the cargo through leakage.

Liquid Air.—Air under certain pressures and temperatures is not a perfect gas. If brought to the temperature of 312° F. below zero, air at atmospheric pressure will be condensed to a liquid. Having once obtained the liquid air at atmospheric pressure and its corresponding temperature of 312° F. below zero it may be placed in an open vessel from which it will evaporate only after a considerable time if simply exposed to the atmosphere, because the portion which evaporates must absorb heat energy from the atmosphere equal to the latent heat of evaporation of the liquid air, and as air is a poor conductor the process is necessarily slow. If the vessels containing liquid air are well covered with a non-conducting material, but not sealed, the liquid will evaporate very slowly and may be readily shipped from one point to another. The most efficient way of keeping liquid air is to place it in a Dewar bulb, so called because it was originated by Prof. Dewar, the great experimenter on the liquefaction of gases. This consists of two bulbs of glass, one within the other, joined to a common neck. In the space between the two bulbs there is a very high vacuum which prevents heat being conducted to the inner bulb. The outside of the inner bulb is silvered with mercury in some cases, and this reflects much of the radiant heat, and a bulb of this sort will hold the liquid air longer than one which is not silvered. A silvered bulb holding 5 quarts has been known to hold liquid air for 29 days before it completely evaporated. Ordinarily, liquid air in cans or vessels insulated with non-conductive coverings and holding 10 gallons or upward can be transmitted by train for say two days with a loss of about 25 or 30 per cent. This has led to the proposition to employ liquid air as a commercial refrigerant, but its cost has so far prohibited its use for this purpose. The very low temperature attainable with liquid air makes it seem that some use may be found for it in the arts which will warrant employing it even if it must be supplied at a high cost. It has been proposed to separate the oxygen from the liquid air for commercial use. The method first employed to liquefy air and other gases was to use the liquid from a gas which is readily liquefied to cool a second gas while under pressure and so liquefy the second gas. Then to start with the liquid from the second gas to liquefy a third

REFRIGERATOR—REFUNDERS

and so on. It was shown later that if air were compressed to about 2,500 pounds per square inch and made to pass through a coil to a throttling cock, liquid air could be produced by causing the cold air leaving the throttling cock to pass over the coil so as to cool the incoming air, thus producing a lower and lower temperature at the throttling cock until liquid air appeared and was drawn off from the apparatus. In an apparatus of this sort the weight of liquid air produced was about 5 to 7 per cent of the entire weight of air compressed. In this type of apparatus all the work done by the free expansion of the air is lost, and there is a field open to development by eliminating this loss and at the same time increasing the refrigerating effect.

Performance of Refrigerating Machines.—The performance of a refrigerating machine is measured by what is termed the "ice-melting effect," which is obtained by dividing the amount of refrigeration measured in British thermal units by the latent heat of fusion of ice, which is 142.2. This represents the number of pounds of ice which would have to be melted in order to produce the same refrigerating effect as the machine in question. The number of tons of ice which a given machine produces in 24 hours is also another common unit, but this cannot be made an absolute unit of refrigeration, because the amount of ice produced depends upon the temperature of the water frozen, the losses due to radiation at the freezing tank, etc. The theoretical performance of a compression refrigerating machine is found by computing the piston displacement per minute, and from this determining the weight of gas at the suction pressure which would be drawn into the cylinder and discharged for full displacement. From the law of compression of ammonia gas the horsepower developed in compressing the gas to the pressure existing in condenser is computed, and by adding the friction of the machine the horsepower necessary at the steam cylinder is determined. The cooling effect in British thermal units is computed by subtracting from the total heat of the liquid at the pressure existing in the refrigerating coils the sensible heat of the liquid at the condenser pressure. By reducing this to the equivalent ice-melting effect and dividing by the coal required to develop the horsepower in the engine cylinder we obtain the ice-melting effect per pound of coal.

Table II. gives the results of such computations and compares them with the results actually obtained in tests of refrigerating machines. It may be seen that in all cases the theoretical performance is greater than the actual. The difference is caused by loss due to heating the gas on entering the compressing cylinder, to radiation, and to friction and wire drawing at the inlet and exit valves.

D. S. JACOBUS, M. E.,

Stevens Institute of Technology, Hoboken, N. J.

Refrigerator, a machine or apparatus employed to reduce temperature by chemical or mechanical means. In the restricted sense in which it is most familiarly understood, the term refers to any vessel or chamber in which animal and vegetable substances, solid or liquid, are kept, and are prevented from decaying or fermenting, by the presence of ice, or freezing mixtures, or by the circulation of currents of air or liquid furnished by a refrigerating ma-

chine. Domestic refrigerators of this character are made in a great variety of forms, ranging from the common metal-lined wooden ice-box, provided with a tube to drain off the water from the melting ice in the ice chamber, to the large and elaborate ice-rooms used for extensive storage purposes.

Refrigerator cars employed to transport perishable merchandise without deterioration over long distances may also be considered as belonging to this class. They were first operated

Domestic Refrigerator.

in 1867, between Chicago and New York city, and succeeded in keeping the meat transported fresh and sweet through an interval of 10 days, during the hottest summer months. Each end of a car is provided with a chamber in which blocks of ice are packed on gratings in such a manner as to permit the circulation of a current of air, furnished by a blower driven by a belt on one of the axles, over the ice and through the storage space in the car.

Refuge, Cities of, six Levitical cities divinely appointed as places of refuge to one who had committed manslaughter, and was pursued by the "Revenger" or "Avenger" of Blood. Three (Kedesh Naphtali, Shechem, and Hebron) were west of the Jordan, and three (Bezer in Reuben, Ramoth Gilead in Gad, and Golan in the half-tribe of Manasseh) were east of that river. If the case was proved to be one of murder, the perpetrator might be taken from the City of Refuge and put to death; if it was only manslaughter, the refugee had to remain in the city to which he had fled till released by the death of the high priest (Num. xxxv. 6-34; Josh. xx. 1-9).

Refugees, *rěf'ū-jēs'*, a name commonly applied to political or religious exiles, but originally and particularly to the French Protestants who fled from their native country on account of the persecutions to which they were exposed after the repeal in 1685 of the Edict of Nantes, under which the reformed doctrines had enjoyed toleration from the year 1598. About 800,000 Protestants fled from their native country. England, Denmark, Holland, Switzerland, Germany, in the latter especially Saxony, Brandenburg, and Hesse, received these fugitives with hospitality. See HUGUENOTS.

Refunders. See READJUSTERS.

REGATTA — REGICIDE

Regat'ta, originally a gondola race held annually with great pomp in Venice on the canals intersecting the city. The term is now popularly employed in the United States and other countries to signify a showy sailing or rowing race, in which a number of yachts or boats contend for prizes.

Regelation, *rē-jē-lā'shōn*, a phenomenon observed by Faraday in 1850, namely, that two pieces of moist ice placed in contact will freeze together, even in a warm atmosphere. It is proved that beside the pressure from the weight of the upper piece of ice there is atmospheric pressure holding the two pieces together; this pressure melts the ice at the parts which bear on one another, and thus enough heat is absorbed to produce regelation. Professor Thomson's discovery, that the freezing-point is lowered by pressure, explains the motions of glaciers and the apparent plasticity of ice under pressure.

Regenera'tion, the act or the state of being born again in a spiritual sense. The word is a literal version of the term *palingenesia*, peculiar to the New Testament, in which it occurs twice only, namely, Mat. xix. 28, where it signifies the renovation of all things at the second coming of Messiah; and Titus iii. 5, "washing of regeneration," where it signifies a new life, a new spirit in the individual redeemed soul. In many other passages of the New Testament, and specially in John iii. 1-10, the new birth is spoken of without the use of the word regeneration, but in such terms as plainly to indicate that the soul which is received into the kingdom of Christ is born into a new life. Regarding the relation of the sacrament of baptism to the new birth there are chiefly two divergent views entertained by divines. One view, which till the Reformation was well nigh universal, and which is still held by the Catholic Church as an article of faith, regards baptism as the agency whereby the Holy Spirit bestows the new life. According to the other view the washing of water in baptism is but a sensible representation of the spiritual new birth, and regeneration is effected independently of baptism by the direct action of the Holy Spirit. The first view is called that of "baptismal regeneration." Article xxvii. of the Articles of Religion of the Church of England teaches that baptism is "a sign of regeneration whereby, as by an instrument, they that receive baptism are grafted into the Church"; but in 1849, by a judgment of the privy council, it was decided that in the Established Church of England Baptismal Regeneration is not a doctrine taught in her articles and formularies as legally construed.

Regensburg, *rā'gēns-boorg*. See **RATISBON**.

Regent, *rē'jēnt*, in a general sense, is a ruler, the ruler of a state; in a more limited sense, one who exercises the highest power vicariously during the absence or incapacity of the lawful sovereign.

Regent is also the title of certain state officers of New York who exercise authority over the higher educational institutions.

Regent-bird, a bird of eastern Australia (*Sericulus chrysocephalus*), allied to the bower-birds, which derives its name from the golden color of the head. The males possess a brilliant plumage of glossy satin-like texture and of

black and yellow colors, but the females are dingy in appearance. The regent-birds are of very shy habits, and inhabit the forest depths, making bowers less complicated and striking than those of some other bower-birds (q.v.), but for the same purpose. The food consists of fruits and seeds principally. One of the honey-eaters is called mock regent-bird on account of its black and yellow plumage.

Regent Diamond. See **DIAMOND**.

Regent's Park, London, England, one of the principal metropolitan pleasure-grounds, covering 470 acres, in the western boroughs of Marylebone and Saint Pancras. The Zoological Gardens are in the northern section of the park, and the Royal Botanic Gardens occupy a circular area in the southern section. See **LONDON**.

Reggio di Calabria, *rēd'jō dē kā-lā'brē-ā*, Italy: (1) capital of a province of same name, a seaport town opposite Messina at the extreme southern point of the peninsula. Reggio was founded by Greek colonists at an early period, becoming later a Roman possession. Ancient Græco-Roman baths were recently revealed in excavating. It fell alternately into the hands of Saracens, Spaniards, and Turks, and finally, in 1783, its ruin was almost completed by earthquake. Its chief industries are the manufacture of essential oils, olive oil, silk, and printing. Pop. (1901) 44,417. (2) The province is rugged and mountainous, covering an area of 1,221 square miles. Pop. (1901) 430,079.

Reggio nell' Emilia, *nēl lā-mēl'lē-ā*, Italy, (1) capital of the province of the same name, 38 miles northwest of Bologna, on the canal of Tassone. It is well-built and enterprising. Its chief points of interest are its ancient walls and ramparts, cathedral, and library. Ariosto and Spallanzane (qq.v.) were born in Reggio. Pop. (1901) 59,176. (2) The province lies between Parma on the west and Modena on the east. Its southwest portion is covered by the Apennines. The opposite portion is flat and alluvial, bordering the Po. Area 884 square miles; pop. (1901) 274,495.

Regicide, a term applied to persons who bring about the death of a king, by assassination or otherwise, and specially applied in history to the judges of Charles I., and the members of the French Convention who voted for the death of Louis XVI. Of the judges, 67 in number, who actually sat in trial on Charles I. only 59 signed the death warrant. After the Restoration the regicides were brought to trial on a charge of high treason. Twenty-nine were condemned to death, but only 10 were executed, 19, together with 6 others who were not tried, being imprisoned, most of them for life. More than 20 who were already dead were tried and condemned, notwithstanding, and Cromwell, Ireton, and Bradshaw, three of them, were exhumed and hanged at Tyburn, and then reburied at the foot of the scaffold.

In July 1660, there arrived at Cambridge, Mass., Edward Whalley and his son-in-law, William Goffe, two of the judges who had condemned Charles I. For some months they appeared in public and joined in the devotional meetings in Cambridge and Boston, where they were kindly received. Upon the news of the passage by Parliament of the Indemnity Act.

REGILLUS — REGINA

marking Whalley and Goffe for vengeance as regicides, they fled to New Haven and were received and concealed by Davenport in the "Judges' Cave." They were concealed from pursuit at New Haven and Milford for nearly two years. After this they fled to a cave in New Hampshire, but were there discovered by some Indians and returned to Hadley, Mass., where they were concealed until their death, Whalley dying in 1674, Goffe in 1679. When King Philip attacked Hadley in 1675, Goffe appeared and led the defense. Dixwell, another regicide, also escaped to New England.

Regillus, řě-jil'ūs, **Lake**, a lake of ancient Latium, lying to the southeast of Rome, noted as the scene of a great victory won by the Romans over the Latins 496 B.C. No certain identity has been established with any modern lake, though some would locate it in the crater of an extinct volcano near the town of Frascati, and others find it in the Lago della Doganella, east of the Alban Mount.

Regiment, one of the divisions of a modern army. Regiments appear to have originated with modern standing armies. They are mentioned in France in 1562, and in England in 1588. The regiment may be considered as the unit of organization of a modern army. The various parts which compose it are never permanently separate, except in the artillery, which is organized in an anomalous way. In the United States each regiment of cavalry consists of 12 troops and one band, organized into 3 squadrons of 4 troops each, and under the minimum requirements of the law is constituted as follows:

For each regiment: 1 colonel and 1 lieutenant-colonel, 1 chaplain, and 2 veterinarians. The non-commissioned staff consists of a regimental sergeant-major, 1 quartermaster-sergeant, 1 commissary-sergeant, and 2 color sergeants. For each troop: 1 captain, 1 first and 1 second lieutenant, the enlisted force consisting of 1 first sergeant, 1 quartermaster-sergeant, 6 sergeants, 6 corporals, 2 cooks, 2 blacksmiths and farrier, 1 saddler, 1 wagoner, 2 trumpeters, and 43 privates. A major commands each squadron, for which a staff consisting of an adjutant (1st lieutenant) and quartermaster and commissary (2d lieutenants) and 1 sergeant-major is authorized.

Each regiment of infantry consists of 12 companies and 1 band, organized into 3 battalions of 4 companies each, and under the minimum requirements of the law is constituted as follows: For each regiment 1 colonel and 1 lieutenant-colonel and 1 chaplain. The non-commissioned force consists of a regimental sergeant-major, and 2 color-sergeants. For each company, 1 captain, 1 first and 1 second lieutenant, the enlisted force consisting of 1 first sergeant, 1 quartermaster-sergeant, 4 sergeants, 6 corporals, 2 cooks, 2 musicians, 1 artificer, and 48 privates. See **REGULAR ARMY**; **ARMY OF THE UNITED STATES**; etc.

Regina, Canada. The first seat of government in the Northwest Territories and since 1 Sept. 1905 the provisional capital of the new province of Saskatchewan, with no important obstacle in its path to final selection for that honor by the incoming legislature. Regina has

had a degree of progress in recent years quite in harmony with that of the vast country around it.

Railways and Location.—The main line of the Canadian Pacific Railway bisects the city which is also the southern terminus of the Regina & Prince Albert Railway, which serves fertile districts extending 250 miles to the north. It is the western terminus of the Arcola extension of the Canadian Pacific Railway, traversing a rich and fertile country of which 150 miles is tributary to Regina. So with the line from Sault Ste. Marie. The Canadian Northern Railway will soon pass through the city and the Grand Trunk Pacific will tap the district of which it is the centre and will send a branch into the city. Other lines are projected. Regina is the only railway centre between Winnipeg and Calgary, a distance of 840 miles—360 from the former and 480 from the latter.

Industries.—The land in the immediate vicinity of Regina is as good and fertile as that in any part of the continent of America, the soil to the south and north of the railway track being particularly rich. Generally speaking, the characteristic of the land is a black clayey loam three or four feet deep, with a sub-soil of clay. It produces the finest wheat and for vegetables and garden produce the Regina district cannot be surpassed anywhere in the world. The local market gardeners retail their produce to places forty miles away. Wheat grown in the district has been selected by the United States authorities for seed-grain, and many portions of the Dominion send to the district for seed in order to improve the wheat they grow. Not only is the quality of the grain good, but the yield is great. According to the official bulletin of the government the average yield per acre of spring wheat in the Regina district during the last seven years was 20.96 bushels, a figure that is not yet reached by any other locality in the Northwest.

As the provincial headquarters of the Massey-Harris Company, the American-Abell Engine and Thresher Company, the International Harvester Company, the Cockshutt Plow Company, etc., it is the centre of a steadily growing distributing trade. Among the industries of Regina are grain separators and picklers, office and bank fixtures, sash and doors and builders' materials, pressed brick and artificial stone, pork-packing, cement blocks, marble works, soda water, etc., aerated waters, flour mills, foundry and machine works, planing mills and furniture.

Financial and Commercial Progress.—Regina's period of real progress began in 1903. Its assessment in that year was \$1,226,000; in 1904 it was \$2,284,710; in 1905 it was \$3,981,413. On 31 Dec. 1904 its surplus assets over liabilities was \$568,516. The building operations of 1903 are said to have totalled \$500,000 and of 1905 about \$1,000,000. In 1889 the duties paid at the Regina custom house were \$2,500; in 1899 they were \$18,524; in 1903-4 they were \$89,654. The postoffice revenue in 1901 was \$9,607 and in 1904 \$27,260. The value of the money orders purchased rose in the same years from \$18,446 to \$65,581; of money orders paid from \$33,223 to \$96,799; the value of postal notes paid from \$6,445 to \$23,160.

REGIOMONTANUS — REGISTRATION OF PROPERTY TITLES

Institutions and Government. — There are five schools in the city as well as a high school and a normal school, and schools are plentiful throughout the district. There are four weekly newspapers and one daily newspaper, an active board of trade, a live agricultural association, five branches of chartered banks, a club, five hotels; while as to merchandise every branch is supplied by large and well-stocked stores. The professions too are well represented. The elevator capacity is ample, there being 170 elevators with a capacity of 6,000,000 bushels in the district and a flour mill in the city. The Church of England, the Roman Catholic, the Presbyterian, the Methodist, the Baptist and Greek Churches, and the Salvation Army, have each a place of worship; temperance and missionary organizations are active throughout the district, and the city and its vicinity are remarkably free from crime or other indications of a low tone of conduct. The city has also a splendid new hospital with the most modern equipment.

The municipal government of the city is entrusted to an elected council consisting of mayor and aldermen. A vigorous policy of municipal ownership and operation of franchises has been inaugurated. The result is that Regina has an up-to-date electric light service and an excellent gravitation water-works system. An equally good drainage and sewage system is at present in course of completion and the streets and avenues are being boulevarded.

History and Population. — Regina was started as a prairie village, or settlement, and grew for some years rather slowly. In 1882 it was a village of tents; in 1901 its population was only 2,645; in 1905 the population was estimated at 8,000. Yet for years it had been the centre of government for vast regions, including 345,000,000 acres of land. To-day increasing population and production in the surrounding country have made it the commercial, judicial, scholastic and political centre of the province of Saskatchewan.

J. CASTELL HOPKINS,
Editor of 'The Canadian Annual Review.'

Regiomontanus, rē'ji-ō-mōn-tā'nūs, German astronomer, whose real name was Johann Müller, but who assumed that of Regiomontanus, in allusion to the place of his birth, Königsberg (Kings Mountain), Franconia: b. 6 June 1436; d. Rome 6 July 1476. Having received a classical education at Leipsic he placed himself under Purbachius (Georg von Purbach), the professor of mathematics at Vienna, and under him became one of the first astronomers of that age. With Purbachius he accompanied Cardinal Bessarion to Rome in 1461, where Beza gave him further instruction in Greek literature, and he now completed a new abridgment in Latin of the 'Almagest' of Ptolemy (1496), correcting many errors in the former translation, made by George of Trebizond. In 1471 he built an observatory at Nuremberg and established a press; but after three years returned to Rome on the invitation of Sixtus IV., who employed him in the reformation of the calendar, and rewarded his services by raising him to the bishopric of Ratisbon (1475). He died, according to some, of the plague, according to others by poison

administered by the son of George of Trebizond, out of revenge for his having exposed the errors of his father. Regiomontanus was the first in Germany to apply himself to the cultivation of the neglected science of algebra. He made great improvements in trigonometry, into which he introduced the use of tangents. His refutation of a supposed discovery of the quadrature of the circle, and numerous writings on various subjects of natural philosophy, display extensive learning and great acuteness. His astronomical observations from 1475 to 1506 ('Ephemerides') are very accurate. Among his other works 'Kalendarium' (about 1474), 'De Triangulis Omnimodis' (1533); 'Tabulæ Directionum Projectionumque in Nativitatibus multum utiles' (1585). Consult Gunther, 'Johannes Müller' (in the 'Allgemeine deutsche Biographie,' Vol. XXII., 1855).

Register, the title of a public officer who has charge of records, his duties varying in different States. Also a device for automatically indicating the number of revolutions made or amount of work done by machinery; or recording steam, air, or water pressure, or other data, by means of apparatus deriving motion from the object or objects whose force, distance, velocity, direction, elevation, or numerical amount it is desired to ascertain. There are various appliances of this kind, each particularly adapted for the peculiar operation which is to be investigated; many depending on the action of clock-work mechanism, which indicates results on dials, but others, as in registering meteorological instruments, having means for recording varying conditions, as with the anemometer, barograph, etc. The cash register is a machine for recording money payments. It is of very general use in retail establishments throughout the world.

Registration of Births, Marriages, and Deaths. France has the most perfect system of registering births, marriages, and deaths. There it is the duty wholly of the civil authority, and the methods are so thorough and comprehensive that it is practically impossible for a birth, a marriage or death to occur without going on record. In the United States registration of births, marriages, and deaths is universally required by State laws, but it is only in well organized municipalities that it is fully enforced, and even there much depends on the willingness of doctor, minister, or other civilian upon whom the law imposes the duty of making report to the authorities, to perform that duty. In rural and remote districts births, marriages and deaths often go unrecorded, thus causing doubt and uncertainty which may cast a cloud on property titles and the legitimacy of children. Claims to great age are often made more than doubtful by the lack of any authentic evidence as to date of birth. Indeed, owing to the lax methods of registration which prevailed up to the latter part of the 19th century it is almost impossible to establish the pretensions of alleged centenarians. The importance of registration has of late, however, impressed itself deeply on the public, and everywhere throughout the United States an improvement is being witnessed in this regard.

Registration of Property Titles. The United States leads the world in its system — which is practically the same everywhere

throughout the Union—of recording property transfers. The possession of a deed of property is not proof of title. The title rests legally in the person in whose name it is recorded in the books of the register or recorder, or by whatsoever name the official having charge of such records is known. The first business therefore of a person acquiring property is to have the deed registered. Otherwise the former owner could sell the same property to another, and if the latter had received no notice of the previous transfer, the transaction, and gave value for the estate, and had his deed recorded first, he could hold the property against the person who had received a previous deed, but had failed to put it on record. The officials in charge of the records are sometimes county and sometimes town officers, and the deed is recorded the moment it is received, even although not entered on the books for some time after. Therefore it is carefully stamped with the hour, minute and even second of its presentation. The old cumbersome English method of vesting title on a trunkful of deeds is therefore unknown in America, where registration has been the rule from the time of the earliest settlers, who allotted lands to each freeman, and made a record of the division.

Chattel mortgages are also recorded; otherwise the mortgagee is without protection against transfer to a third and innocent party who might purchase the goods, or advance money on them.

England has been slow to follow the example of the United States in this as in other matters, but the convenience of the American system and the cumbersomeness of the English, which was growing more top-heavy year by year, has led to the adoption of a method of voluntary registration which makes it possible to transfer and hold property without having to hand over or keep a mass of old title-deeds. In Scotland an excellent system for the registration of transfers of heritable property has existed since 1617.

Registration of Voters. Registration of voters is required by law in most of the American States, as a check to fraudulent voting. In some States a voter having once registered is not required to register again while he retains the same qualifications and residence. In the State of New York yearly registration is required in the large cities, while in the country districts it is not necessary. Previous to registration "repeating"—that is voting more than once in one election—and other frauds were very common, and probably affected the results of important political contests. The voter is required, as a rule, to give his name, age, residence, place of birth, and if of foreign birth, produce his naturalization papers, should the registering officials demand them. For a short time New York State had a law requiring the registry board to make a record of the physical defects of voters for identification, but this proved offensive and unpopular, and was soon repealed. It is a penal offense to make a false statement in registering. See various articles dealing with voting and suffrage.

In Great Britain and on the continent of Europe, voters are required to register, a most exact scrutiny being enforced as to the possession of legal qualifications for the suffrage.

In England the registration of electors was first established by the Reform Act of 1832, in terms of which, in England, the overseers of each parish were required to draw up a register of all persons qualified to vote. This still forms the basis of procedure, but the law has been frequently altered, the latest act on the subject being the Registration Act of 1885.

Regium Donum, rē'jī-ŭm dō'nŭm ("royal gift"), an annual grant of public money formerly received by the Presbyterian and other Non-conformist ministers in England, Scotland, and Ireland. The Irish Regium Donum was withdrawn by the Act of 1869, which came into force in 1871, disendowing the Irish Episcopal Church. Compensation was made of life interests; and the ministers were allowed to commute on the same terms as the clergy of the Church. In 1874 it was reported that the commutation money paid had amounted to \$2,898,810. The Regium Donum in England was enjoyed by the three denominations, Presbyterians, Independents, and Baptists, from 1723 till 1851. The amount required was annually voted by Parliament till 17 July 1857. The Scotch Episcopalians also enjoyed for a time a small share.

Regius (rē'jī-ŭs) **Professors**, the designation of professors at Oxford and Cambridge whose chairs were founded by Henry VIII. The name is also given to professors in other universities who receive their appointments from the crown.

Regla, rāg'lā, Cuba, town, province of La Habana, on Havana Harbor opposite the city of Havana. It is connected with Havana by ferry, with Matanzas and other towns to the east by rail and also has a street railway running to Guanabacoo. It contains foundries, shipyards, and large sugar warehouses, and has a considerable trade, especially in the exporting of sugar. It contains a large bull ring, formerly the scene of the Havana bull fights. Pop. (1899) 11,363.

Regnard, rē-nār, **Jean François**, French comic dramatist: b. Paris 1 Feb. 1655; d. Grillon 4 Sept. 1709. He was the son of a rich merchant, and while on a voyage to Italy was captured by pirates and sold as a slave in Algiers. Being redeemed by his family he traveled extensively in Holland, Germany, Poland, and Lapland. He wrote many comedies for the French stage, his masterpiece being 'Le Joueur' (1696), which holds a place second only to some of Molière's. Other pieces produced at the Théâtre-Française were: 'La Sérénade' (1694); 'Le Bourgeois de Falaise' (1696); 'Le Distrait' (1697); 'Democrite' (1700); 'Le Retour imprévu' (1700); 'Les Folies amoureuses' (1704); 'Les Ménechms' (1705). The best editions of his works are by Didot (1820); Michiels (1854); Fournier (1875); Moland (1893).

Regnault, rē-nō, **Alexandre Georges Henri**, French painter: b. Paris 30 Oct. 1843; d. Buzenval 19 Jan. 1871. He was trained in art under Lamothe and Cabanel; in 1866 carried off the Prize of Rome by his 'Thetis Bringing Weapons to Achilles' and for the next two years lived in Italy, where he furnished illustrations to the 'Travels' of Francis Weh. He next visited Spain where his passion for light

and color was satisfied in studying the works of Goya and Velasquez, of whose 'Las Lanzas' he made a copy. In fact, his first work of importance, a colossal equestrian portrait of General Prim (now in the Louvre) was executed at Madrid. He had a natural, temperamental preference for the features of oriental life, and he loved to paint incidents and scenes of horror. Of such a character is his 'Salome,' a personification of bloodthirsty passion; and 'Decapitation in Granada'; two canvases of marvelous daring in color, but repulsive from their cold brutality. When the war of 1870 broke out he returned to France, enlisted, and was killed at the battle of Buzenval, near Paris. The circumstances of his death have invested his name with a certain halo of glory in the eyes of his countrymen and have tended to impart an exaggerated importance to his artistic achievements. Consult: Cazalis, 'Henri Regnault, sa Vie et son Œuvre' (1872).

Regnault, Henri Victor, French chemist and physicist: b. Aix-la-Chapelle, Germany, 21 July 1810; d. Auteuil, France, 19 Jan. 1878. After study at the Ecole Polytechnique of Paris, he became a mining engineer and later a professor at Lyons. His 'L'Action du Chlore sur l'Ether Chlorhydrique' (1840) won for him a professorship at the Ecole and admission to the Academy of Sciences. In 1841 he was made professor of physics in the Collège de France, in 1847 chief mining engineer, and in 1854 director of the Sèvres porcelain manufactory. Among his writings, besides many scientific papers in learned journals, are: 'Cours Élémentaire de Chimie' (1849-50; 6th ed. 1870); and 'Premiers Eléments de Chimie' (1850; 6th ed. 1874).

Regnault, Jean Baptiste, French painter: b. Paris 19 Oct. 1754; d. there 12 Nov. 1829. He studied under Bardin and after capturing the Prix de Rome in 1776, entered the Academy in 1783 and became eventually a professor in the Ecole des Beaux Arts (1755). The influence of David was predominant in his day, and Regnault's paintings are all in the conventionally classic manner of that master. Many of his works are in the Louvre, among them his 'Baptism of Christ,' and his most notable picture, the 'Education of Achilles.' He also produced the historically interesting works, 'The Acceptance of the Constitution by Louis XVI.'; 'Napoleon Proclaimed Consul for Life'; 'Battle of Marengo'; and 'The Death of Dersaiax.'

Régnier, râ-nê-â, Henri François Joseph de, French poet: b. Honfleur 28 Dec. 1864. He was numbered in his earlier days among the Parnassians and later was allied with Mallarmé and the symbolists. His admirers are found among the younger literary men rather than among the academic. Critics have found his verse excellent for a delicacy of taste and a kind of antique inspiration, but have blamed him for sacrificing too much of the sentiment or the idea to the last refinement of expression. He has published in verse 'Sites' (1887); 'Poèmes anciens, romanesques' (1890); 'Tel qu'en songe' (1892); 'Les Jeux rustiques et divins' (1897); 'Les Médailles d'Argile' (1900); etc., and the novels 'La Canne de Jaspe' (1895); 'Le Trèfle blanc' (1899); 'La double Maîtresse' (1900).

Regnier, Mathurin, French satirist: b. Chartres 21 Dec. 1573; d. Rouen 22 Oct. 1613. He was a nephew of the poet Desportes; served as secretary in Rome to the ambassadors Joyeuse and Béthune. Having taken orders as a youth he was granted a canonry at Rouen upon his return from Rome, but his dissipated habits shortened his life. He was famous for his satires in imitation of Horace, Juvenal and Martial, especially those in which he attacked Malherbe, the reigning literary authority of his day. He showed knowledge of life and character and a power in the expression of manners that in the opinion of Sainte-Beuve ranked him after Montaigne, Ronsard, and Rabelais. No good edition of his works appeared in his lifetime; that published in 1608 and in 1613 was entitled, 'Satires et autres Poésies de Maturin Régnier.' The principal modern editions are those by Viollet-le-Duc (1822); Barthélemy (1862); Courbet (1869 and 1875).

Regular Army. The United States Army, as at present constituted, is organized under the Act of Congress, 2 Feb. 1901. It consists of 15 regiments of cavalry, an artillery corps, 30 batteries of field artillery and 126 batteries of coast artillery, 30 regiments of infantry, 3 battalions of engineers, and an additional provisional force of more than 5,000 men. The total strength of the army is about 66,000 men of whom 3,820 are commissioned officers. The act of 1901 provides that the army shall at no time exceed 100,000 men. The general staff of the army includes one lieutenant-general, Samuel B. M. Young, chief of staff; one major-general, Adna R. Chaffee, two brigadier-generals, three colonels, five lieutenant-colonels, and a number of majors and captains. The army is at present largely employed in keeping order in the Philippines, which constitute a military division, divided into the three departments of Luzon, the Visayas and Mindanao.

At the beginning of the war with Spain in 1898 the United States army numbered only about 26,000 men. Energetic measures, supported by voluntary enlistments in every part of the Union, raised this force at one time to 275,000 men. The war was followed by insurrections in the Philippines, and it was deemed best not to make a sweeping reduction of the regular forces, but to leave such reduction largely to the discretion of the President, who would be guided by events as they should arise in increasing or decreasing the number of men under arms. The bill which became a law made it discretionary with the President, under certain conditions, to increase or decrease the army between fixed limits—a maximum of 100,000 men and a minimum of 60,000, the latter being the peace footing of the organization.

In 1903 a bill was passed providing for a general staff, intended to bind the several branches of the service into one organism, with responsibility concentrated in one officer—the chief of staff. The chief of staff takes the place of the general commanding the army. The President, as commander-in-chief, gives the orders, the chief of staff sees that they are carried out; and in case of war the general staff becomes a war board, the board of strategy to plan and direct campaigns, and is answerable for success or failure of its plans, provided officers and the field do their duty. Under the chief of staff

is a group of officers selected from the line and staff of all branches of the service, whose duty it is to keep the chief informed in all details of their several departments.

A new militia law was likewise passed in 1903. It provides for the more complete equipment of this section of the service and the establishment of better co-operation between the National Guard and the Regular Army, and it aims at the creation of a National Volunteer reserve. The present strength of the militia is about 109,000 enlisted men and 9,000 officers.

All persons enlisting in the United States army must be not less than 18 nor more than 35 years of age. They must also be of good moral character, temperate habits, able-bodied and free from disease, and able to speak, read and write the English language. Persons under 18, but meeting the other requirements of the service, are accepted for enlistment if they can produce the written consent of parent or guardian. The height and weight requirements are as follows: For infantry and coast artillery, height not less than five feet four inches; weight not less than 120 and not more than 190 pounds. For cavalry and field artillery service the height must be over five feet four inches and under five feet ten inches, and the weight must not be more than 165 pounds. See ARMY, UNITED STATES; MILITARY ACADEMY, UNITED STATES.

Regular Canons of the Immaculate Conception. See ORDERS, RELIGIOUS.

Regular Clerks of the Faith of Jesus. See ORDERS, RELIGIOUS, *Baccanarists*.

Regulars, in the Roman Catholic Church, persons of either sex who are members of any of the religious orders, congregations, or institutes approved by the Holy See. Those of their number who are in holy orders constitute the Regular Clergy, that is, clergy under a religious rule (*regula*), who are bound by the usual three monastic vows: so contradistinguished from the secular clergy—those clergymen who do not belong to such orders or congregations.

Regulators, a name adopted in South Carolina, about ten years before the Revolution, by citizens who organized themselves to put down lawlessness and enforce respect for life and property. Their methods were very like those of the vigilance committees of California and Nevada, about a century later. The Regulators were pacified by the establishment of courts of law in the disturbed districts.

Some years later in North Carolina an organization calling themselves "Regulators" was formed to resist the extortion and oppression practised by officers of the colonial government. They drove out the local authorities, and Governor Tryon led a military force against them, defeating them after a sanguinary battle, near the Allemanee Creek, 16 May 1771. Tryon hanged six of the Regulators for treason. The survivors generally took the patriot side in the War for Independence, and the "Regulator" movement in North Carolina is regarded by some as one of the beginnings of that struggle.

Regulus, rēg'ū-lūs, **Marcus Atilius**, Roman general of the 3d century B.C. He was made consul in 267 B.C., and a second time about 256 B.C. With his colleague, Manlius Vulso, he com-

manded in the first war against Carthage. With a fleet of 330 ships carrying 40,000 men the consuls defeated a superior Carthaginian fleet in the battle of Ecnomus and effected a landing in Africa. Here Regulus followed up his victories so successfully that in a short time he presented himself before the capital of the enemy. Carthage sued for peace and Regulus who wished to end the war before his successor was appointed demanded unconditional submission. The Carthaginians refusing the terms ended the negotiations and at this juncture were joined by a small body of Spartan volunteers under Xanthippus, to whom was given the command of the Carthaginian forces. In a battle under the walls of Carthage 30,000 Romans fell, and Regulus was made prisoner 255. He remained in Carthage till 250, when the Carthaginians, having been defeated at Panormus were desirous of peace. An embassy was therefore sent to Rome, accompanied by Regulus, who was obliged to bind himself by an oath to return to Carthage if Rome should refuse the terms proposed. Regulus, however, advised the continuance of the war and recommended the Romans not to exchange prisoners. Thereupon he declined to listen to the entreaties of his family or of the senate and persisted in his intention to return to Carthage. It is related that he was put to death with great cruelty, and that Hamilcar and Boscar, two noble Carthaginian prisoners, were given up to the family of Regulus, who took revenge on them in a similar manner. Neither the story of the embassy nor of the revenge is related by Polybius, and Ihne, the German historian, inclines to the modern view that the story was invented to excuse the cruelty of the family of Regulus to their prisoners.

Regulus, the star Alpha Leonis, the brightest in the constellation of the Lion.

Re'gur, a dark superficial soil of India, loam or clayey, occurring chiefly on the tableland of the Deccan and in Nagpur, less frequently in Mysore, and reappearing in southern India in continuous sheets from 6 to 20 feet thick. Although generally a surface soil, it dips beneath recent alluvium. It is extremely fertile, having produced heavy crops for many centuries without requiring manure. Its exact age is undetermined. The name is native.

Rehan, rē'an, **Ada** (originally CREHAN), American actress: b. Limerick, Ireland, 22 April 1860. She came to this country as a child and made her first appearance on the stage at 14 in Newark, N. J. She had not at that time, however, taken up acting as a profession, but continued her education in Brooklyn where her parents lived. She appeared for two seasons at Mrs. John Drew's theatre in Philadelphia, and later in stock companies in Baltimore, Albany and Louisville. In 1879 she became a member of Augustine Daly's stock company first as leading lady and afterward as star, where she continued until Daly's death in 1899. Here she took part in many revivals of old comedy, together with a fewer number of modern plays, principally adaptations from the German made by Daly. Her greatest successes were Katharine in 'Taming of the Shrew,' and Lady Teazle in 'School for Scandal,' though she played with acceptance Viola, Portia, Rosalind, and Beatrice, Peggy Shrift in 'The Country Girl,' and Agatha Posket in Pinero's 'The Magistrate.'

Since 1899 she has appeared on the stage only at considerable intervals.

Reich, rīh, Jacques, American artist: b. in Hungary 10 Aug. 1852. He studied art in Budapest; came to the United States in 1873; continued his art education in New York and Philadelphia; and afterward studied in Paris. He returned to Philadelphia, and became skilled in pen-and-ink drawings and in the etching of portraits on copper. In 1885 he removed to New York. He drew the greater number of the pen-portraits for Scribner's 'Cyclopædia of Painters and Paintings,' and also for Appleton's 'Cyclopædia of American Biography.' His other important work includes a series of portraits of American and English authors and other prominent persons, and half life-size plates of Washington (after the Gilbert Stuart unfinished painting), Jefferson (after the painting by Rembrandt), and President Roosevelt.

Reicha, rī'hä, Anton Joseph, Austrian composer: b. Prague, Austria, 27 Feb. 1770; d. Paris, France, 28 May 1836. He made a study of the violin, pianoforte, and flute, and in 1788 he entered the chapel of Maximilian of Austria as second flute. His ambition, however, was to become a composer and after overcoming many difficulties he succeeded in having his symphonies and other compositions played by his uncle's orchestra at the court of the Elector of Cologne. Reicha lived in Hamburg 1794-9 and there wrote his first opera, 'Obaldi, ou les Français en Egypte,' but failed to obtain its production in Hamburg or Paris, though several of his symphonies were well received. In 1802-8 he lived in Vienna, where he enjoyed the patronage of Maria Theresa and was intimate with Beethoven, Haydn, and other great musicians. He removed to Paris in 1808, became professor at the Conservatoire in 1818, was naturalized in 1829, and elected to the Institute in 1835. He was chiefly notable for his chamber music and his theoretical work, though his symphonies and overtures met with considerable success. His operas were lacking in dramatic effect, though their music is excellent. He was also author of numerous theoretical works, among which may be mentioned: 'Traité de Melodie' (1814); 'Traité de haute Composition musicale' (1818); 'Art du Compositeur dramatique' (1833); etc.

Reichardt, rī'härt, Johann Friedrich, German composer and author: b. Königsberg 25 Nov. 1752; d. Giebichenstein 17 June 1814. He studied in the universities of Königsberg and Leipsic; was appointed Kapellmeister by Frederick the Great, and during his tenure of office introduced Concerts Spirituels for the performance of novelties with analytical programs. He conducted Italian opera under Friedrich Wilhelm II., but his French sympathies brought about his dismissal in 1794. He was court director at Cassel for a short time during the incumbency of the king of Westphalia. He holds an important place in the history of music from the fact that his Singspiele are factors in the development of German opera, and his Lieder are among the earliest of their kind. He wrote operas, oratorios, and cantatas, besides compositions for orchestra and pianoforte, and set to music Bürger's translation of Macbeth, Goethe's Faust, Egmont, and Tasso, besides many lyrics. He edited musical periodicals and

published familiar letters describing his travels ('Vertraute Briefe,' 1810).

Reichenbach, rī'hēn-bäh, Karl, BARON VON, German naturalist: b. Stuttgart 12 Feb. 1788; d. Leipsic 19 Jan. 1869. He studied at Tübingen, where he obtained the degree of doctor of philosophy, and was denounced to the Napoleonic police and imprisoned for having organized an association with the fanciful object of founding a German kingdom in the South Seas. He visited the principal iron works in France and Germany, and established others of his own at Villingen, and the first large German charcoal-burning establishment at Hausach in Baden. In 1821 he founded with Count Hugo zu Salm, a number of industrial establishments in Moravia, from which he realized a considerable fortune. The king of Württemberg raised him to the dignity of baron in 1839. In 1834 he published in Vienna 'Mittheilungen aus Mähren,' the first geological monograph in Austria. He is also credited with some chemical discoveries, in particular of paraffin and creosote. In the course of his studies of animal magnetism he believed he had discovered a new force, which he called *od* and upon which he published several works, as 'Odisch-magnetische Briefe' (1852); 'Der sensitive Mensch und sein Verhalten zum Od' (1854). *Od*, he said, was a peculiar power possessed by certain persons of special sensitiveness, which enabled them to detect veins of ore, distinguish negative and positive magnetic poles, start a pendulum without touching it, and the like. He derived the word from the Latin *vado*, 'I go quickly.' Part of the scientific world attacked his theory, but the larger portion laughed it out of court; and after his death it was quite forgotten. Reichenbach's latest works were 'Köhlerglaube' and 'Afterwissenschaft,' in reply to Karl Vogt (1856); 'Aphorismen über Sensibilität und Od' (1866); 'Die odische Lohe' (1867).

Reichenbach, Saxony, 11 miles southwest of and in the circle of Zwickau, is a manufacturing town, trading considerably in woolen and cotton goods. This is the home of the distinguished antiquary, Böttiger (q.v.). Pop. (1900) 24,498.

Reichenberg, rī'hēn-bērg, Austria, town in Bohemia; on the Neisse; about 60 miles in direct line north-northeast of Prague (q.v.). It is a well-built town with several modern public buildings and a number of historic edifices dating back to the 13th and 14th centuries. It is one of the leading manufacturing towns of Austria. The chief manufactures are woolen, cotton, and linen goods, carpets, leather, shoes, hats, gold, and silver ware, musical instruments, and firearms. The schools rank high; it has an excellent industrial school. Pop. (1900) 34,099.

Reichmann, rī'h'män, Theodor, German opera singer: b. Rostock, Mecklenburg, 18 March 1849; d. Vienna, Austria, 23 May 1903. He studied at Berlin, Prague, and Milan, and became widely known on the German operatic stage as a dramatic baritone. In 1882 he began his engagement at the Vienna Opera House, and in that year created the part of Amfortas in 'Parsifal' at Baireuth. He continued at the Vienna Opera House with great success until 1889, when he came to New York and made his first appearance at the Metropolitan Opera

House in 'The Flying Dutchman.' His reception there was most flattering, and his success was marked throughout his engagements there in 1889-90, 1890-1. He possessed a remarkable voice; and his dramatic impersonation of his various roles made him one of the most famous operatic singers of his day. He was notable in his presentation of the roles: William Tell, Wolfram, Wotan (in 'Siegfried'), Nelusko (in 'L'Africaine'), etc.

Reichsrath, rīhs'rāt, the representative council of the empire of Austria. See AUSTRIA.

Reichstadt, rīh'stāt, **Duke of** (NAPOLEON FRANÇOIS CHARLES JOSEPH BONAPARTE), titular emperor of France: b. Paris 20 March 1811; d. Schönbrunn, Austria, 22 July 1832. He was son of Emperor Napoleon I. (q.v.), and from his birth was styled "king of Rome." After his father's first abdication in 1814 he went with his mother to Vienna. After Waterloo, Napoleon proclaimed him Napoleon II. (22 June 1815). He was brought up at the court of his grandfather, the Emperor Francis, who created him Duke of Reichstadt (1818). His education was careful, and he was early trained to the military profession. After passing through subordinate grades he was made a lieutenant-colonel in June 1831, and took command of a battalion in the Gyulai regiment of Hungarian infantry, then garrisoned at Vienna. He was extremely attentive to his military duties, but he had grown very tall and slender, and symptoms of consumption had early shown themselves. His physician advised a removal to Schönbrunn, but this proved unavailing. The Duke is said to have possessed rare linguistic powers. He was made the hero of 'L'Aiglon' ('The Eaglet'), a drama by Edmond Rostand (q.v.). Upon the accession of Napoleon III. (q.v.), he was reckoned among French sovereigns as Napoleon II. Consult: Welschinger, 'Le Roi de Rome' (1879); Lacroix, 'Le Roi de Rome' (1899); Wertheimer, 'Der Herzog von Rom' (1902).

Reichstag, rīhs'täg, the representative legislative body of the German nation as a whole. The Bundesrath is of the separate German states. The president of the Reichstag is elected by the deputies. See GERMANY.

Reid, rēd, **SIR George**, Scottish artist: b. Aberdeen, Scotland, 31 Oct. 1841. He studied art in Edinburgh, Utrecht, Paris, and The Hague, being the pupil in turn of Mollinger, Israels, and Yvon. In 1891 he was elected president, in succession to Douglas, of the Royal Scottish Academy. He is widely known for his fine portraits. He is also distinguished as a flower and landscape painter and is a book illustrator of no mean merit.

Reid, George Agnew, Canadian painter: b. near Wingham, Ontario, 1861. At Paris he was a pupil of Constant, Lefebvre, and Dagnan-Bouveret and became a constant exhibitor at the Salon. The World's Fair Columbian medal was awarded to his 'The Foreclosure of the Mortgage' (1893). He has been successful in panel decoration and the series in the entrance hall of the Municipal Buildings, Toronto, contain very good examples of his style. In 1898 he was elected president of the Ontario Society of Artists.

Reid (Thomas), Mayne, British author of tales of adventure: b. Ballyroney, County Down, Ireland, 4 April 1818; d. near Ross, Herefordshire, England, 22 Oct. 1883. The son of a Presbyterian minister he was educated for the ministry, but love of adventure took him to this country, where he engaged in various callings, and traveled widely as hunter and trader. In 1843 he was a journalist in Philadelphia, but joined the United States army as a volunteer in 1846 and fought in the Mexican War, his experiences in which furnished him with materials utilized in several novels. He afterward went to London and became well known as a writer of thrilling stories, many of them based on his American experiences, such as 'The Rifle Rangers'; 'Scalp Hunters'; 'The War Trail'; 'The Headless Horseman'; etc. He returned to America in 1867 and founded the 'Onward Magazine,' which was unsuccessful, and in 1870 went back to England. Many of his tales were translated into French and German. They were all very readable and healthy in tone, though extravagant in incident. Consult 'Memoir' by his wife (1890).

Reid, Robert, American painter: b. Stockbridge, Mass., 1863. His work shows the influence of Impressionism, but as the pupil of Boulanger and Lefebvre in Paris, where he began his art studies, he maintains an academic correctness, and insistence upon detail which render his work singularly effective. His great decorative piece in the Paris Exposition of 1900 ('America Unveiling Her Natural Strength') was much admired, and like all his productions in this department has extended his reputation.

Reid, Robert Gillespie, a Newfoundland railway contractor: b. Coupar-Angus, Scotland, about 1840. In 1865 he went to Australia, where he took part in gold-mining and public works; in 1871 came to America, and later constructed many important railways in the United States and Canada. The heaviest section of the Canadian Pacific was built by him; and he was prominent also in bridge-work, constructing the international railway bridge over the Rio Grande, the international bridge across the Niagara, and (1886) the Lachine bridge, traversing the Saint Lawrence, three fourths of a mile in length. In 1893 he made with the colony of Newfoundland a contract whereby he was to build a railway from Saint John's to Port-au-Basque to be completed in three years at \$15,600 per mile. For the further consideration of a land-grant of 5,000 acres per mile of construction, he was to maintain and operate the railway for 10 years. He contracted with the colonial government in 1898 to operate all the railways of the island for 50 years, maintaining them in a safe and efficient manner, on condition that the railways should become his property at the end of that period. He was to obtain also 2,500,000 acres of land-concessions additional, and the government land telegraph lines. On his part he contracted also to build and operate seven steamers transporting passengers and goods at various points in the island; to buy and operate the Saint John's dry-dock; to build and operate an electric street-railway in Saint John's; to pave a specified portion of Saint John's; and to pay \$1,000,000 within one year from the date of the signing of the contract. In fact, he became the real owner of the island, and was popularly known as "Czar" Reid.

Sir Robert Bond, the Liberal leader, protested against the contract, and Reid was finally obliged to transfer his property to the Reid Newfoundland Company, while adjustment of the contract was made favorable to the government.

Reid, Samuel Chester, American naval officer: b. Norwich, Conn., 25 Aug. 1783; d. New York 28 Jan. 1861. He entered the United States navy as a midshipman when very young, rose rapidly in rank and in the War of 1812 commanded the privateer General Armstrong. He repulsed the British attack in the harbor of Fayal, Azore Islands, 26 Sept. 1814, the enemy having three vessels with 2,000 men to his single vessel with 90 men. During 10 hours' fighting, the British lost 300 killed and wounded and the Americans two killed and seven wounded. Reid was subsequently harbormaster and warden of the port of New York. He invented a signal telegraph, reorganized the pilot-boat system, established a lightship off Sandy Hook, and designed the present flag of the United States, first used in 1818, suggesting the retention of the original 13 stripes and the addition of a star for each new State.

Reid, Thomas, Scottish metaphysician: b. Strachan, Kincardineshire, 26 April 1710; d. Glasgow 7 Oct. 1796. He was graduated at Marischal College, Aberdeen, in 1726, and in 1736 presented to the neighboring living of New Machar. It was his custom to preach the sermons of Tillotson and Evans rather than his own compositions, for he was already chiefly absorbed in the study of metaphysics. In 1748 he published a paper in the London 'Philosophical Transactions,' in which he opposed the introduction of mathematical formulas into metaphysical and moral speculations, and particularly criticized the statement of Hutcheson that the benevolence or moral merit of an agent is "proportional to a fraction having the moment of good for the numerator, and the ability of the agent for the denominator." He was elected in 1752 professor of philosophy in King's College, his department comprehending logic, ethics, mathematics, and physics. His 'Inquiry into the Human Mind on the Principles of Common Sense' (1764) aimed at the refutation of Hume's skeptical theory. Affirming the impossibility of proving the existence of an external world from reason, or experience, or instruction, or habit, or any other principle hitherto known to philosophers, Reid introduced the doctrine of an original instinct or "common sense" (q.v.) as the ground of the belief. In 1764 he was transferred to the University of Glasgow as successor of Adam Smith in the chair of moral philosophy. His course included metaphysics, moral philosophy, natural law, and political right. He was a member of a philosophical society before which he read several essays, including an 'Examination of Dr. Priestley's Opinion Concerning Matter and Mind,' 'Observations on the Utopia of Sir Thomas More,' and 'Physiological Reflections on Muscular Motion.' In 1781 he withdrew from public duties to devote himself exclusively to philosophical studies. In 1785 he published 'Essays on the Intellectual Powers of Man,' consisting of his academical lectures, and in 1788 his 'Essays on the Active Powers of Man,' his last important work. An edition of his works with notes and dissertations was pre-

pared by Sir William Hamilton (incomplete, 1846). Consult: Ferries, 'Reid and the Philosophy of Common Sense' (1866).

Reid, Sir Thomas Wemyss, English journalist: b. Newcastle-on-Tyne 1842; d. London 26 Feb. 1905. He contributed frequently to English reviews and magazines, edited the Leeds 'Mercury' (1870-1887), and 'The Speaker' from 1890 to 1899, when he resigned and published: 'Cabinet Portraits: Sketches of Leading Statesmen of Both Parties' (1872); 'Charlotte Brontë: A Monograph' (1877); 'The Land of the Bey' (1882); 'Mauleverer's Millions' (1885); 'Life of William Edward Forster' (1888); 'Life of Lord Playfair' (1899); 'Life of W. E. Gladstone' (1899); 'William Black: a Biography' (1902); etc.

Reid, Whitelaw, American journalist: b. Xenia, Ohio, 27 Oct. 1837. He was graduated from Miami University in 1856; and began his journalistic career as editor of the Xenia News, in 1858-9. In 1860 he became a reporter for the Cincinnati Gazette, in 1861-2 was war correspondent, and later Washington correspondent for the same paper, the brilliancy and accuracy of his war reports attracting considerable attention among newspaper men. He was aide-de-camp on the staff of Gen. Morris and Gen. Rosecrans in West Virginia. In 1863-6 he was librarian of the House of Representatives and after the war spent some time on a cotton plantation in Concordia Parish, La. In 1868 he joined the editorial staff of the New York Tribune; in 1869 became managing editor; and in 1872 editor-in-chief. Under his management the Tribune has come to rank among the leading papers of the city in the trustworthiness of its news reports. He twice declined an appointment as minister to Germany, was minister to France in 1889-92 and negotiated important reciprocity treaties, and in 1892 was the unsuccessful Republican candidate for Vice-President. He was the special ambassador from the United States to Queen Victoria's jubilee in 1897; was a member of the American-Spanish peace commission in Paris in 1898; and was special ambassador at the coronation of Edward VII. in 1902. In April 1905 he was appointed ambassador to the Court of Saint James, to succeed Joseph H. Choate. He has been a regent of the University of New York since 1878. He has written: 'After the War, a Southern Tour' (1867); 'Ohio in the War' (1868), an important contribution to the local history of the State; 'Schools of Journalism' (1870); 'The Scholar in Politics' (1873); 'Newspaper Tendencies' (1874); 'Town Hall Suggestions' (1881); 'Two Speeches at the Queen's Jubilee' (1897); 'Some Consequences of the Late Treaty of Paris' (1899); 'Our New Duties' (1899); 'A Continental Union' (1900); 'Our New Interests' (1900); and 'Problems of Expansion' (1900).

Reid, Sir William, Scottish meteorologist and colonial governor: b. Kinglassie, Fifeshire, 1791; d. London 21 Oct. 1858. He was educated at the Royal Academy at Woolwich, and in 1809 entered the army as lieutenant of engineers, serving in the Peninsular campaign under Wellington, in America in the War of 1812, and in Belgium in 1815. He was appointed governor of Bermuda in 1838 and by his excellent

administration of affairs greatly improved the deplorable agricultural condition of the island. He opened a market for their products in New York and by these and other efficient methods gained the title of "the good governor." In 1846 he became governor of the Windward Islands and in 1848 he returned to England and was appointed commanding engineer at Woolwich. In 1851 he was knighted and appointed governor of Malta, where he remained until 1858. He was raised to the rank of major-general in 1856. He became interested in meteorology in 1831 while superintending the repair of injuries inflicted by a severe hurricane at Barbados and engaged in a correspondence with William C. Redfield (q.v.) of Yale College. The correspondence has since been presented to Yale. He was elected a member of the Royal Society in 1839. His publications include: 'An Attempt to Develop the Law of Storms by Means of Facts Arranged According to Place and Time' (1838); and 'The Progress of the Development of the Law of Storms' (1849).

Reid, William Thomas, American educator: b. near Jacksonville, Ill., 8 Nov. 1843. He served in the Union army during the Civil War, was graduated from Harvard in 1868 and was headmaster of the High School, Newport, R. I., 1868-71. He subsequently taught in the Boston Latin School, was superintendent of the Brookline, Mass., schools 1873-5, was principal of the San Francisco Boys' High School 1875-81, and president of the University of California 1881-5. He founded the Belmont School for Boys at Belmont, Cal., the most important college preparatory school on the Pacific coast, and is its present (1904) headmaster. Consult: Adams, 'Some Famous American Schools' (1903).

Reighard, ri'gård, Jacob Ellsworth, American educator: b. Laporte, Ind., 2 July 1861. He was graduated in 1882 from the University of Michigan; studied also at Freiburg-im-Breisgau; was assistant professor of zoology at the University of Michigan in 1887-8 and 1890-2; and directed the scientific work of the Michigan Fish Commission in 1890-4. In 1898 he was placed in charge of the biological survey of the Great Lakes for the United States Fish Commission. From 1892 he held the chair of zoology in the University of Michigan. He wrote 'The Anatomy of the Cat' (with H. S. Jennings, 1901).

Reign of Terror, a period of the French Revolution, conspicuous for its horrors and cruelties. It is generally considered to extend from 21 Jan. 1793, the date of the execution of Louis XIV., to 28 July 1794, when Robespierre and other sanguinary leaders were guillotined. Every day, during the Reign of Terror, victims were hurried, after a mock trial, to the scaffold, and the prisons were kept replenished by fresh captives from all parts of France. When all the nobility who could be reached had been cut off, the middle and lower classes were drawn upon for victims, and the terrorists even laid traps for each other, in their mad ambition and fear of what the future might be. At last a successful *coup d'état* was secretly organized, which resulted in the extermination of the more rabid revolutionists, and the lifting of the awful nightmare which had brooded for months over France. The Reign of Terror had its reaction

in the despotism of Napoleon, and eventually in the restoration of the Bourbons.

Reikiavik, ri'kē-ä-vík, or Reykjavik, rik'-yä'vik (Dan. REIKEVIG), Iceland, capital of the island, stands on the southwestern coast and is an important northern port from which considerable trade is carried on. The climate is not very severe as generally supposed. The people are unusually intelligent; the chief institutions include a public library, churches, schools. A great fair is held annually. Pop. (1901) 6,700.

Reimarus, ri-mä'roos, Hermann Samuel, German scholar: b. Hamburg 22 Dec. 1694; d. there 1 March 1768. From about 1714 he studied at Jena, and afterward lectured at Wittenberg. He became in 1723 rector at Wismar, and in 1728 was appointed to the professorship of Hebrew in the Gymnasium of Hamburg, which he subsequently united with the professorship of mathematics. He edited the works and wrote the life of his father-in-law, 'De Vita et Scriptis J. Alb. Fabricii Commentarius' (1737). The edition of Dio Cassius, begun by Fabricius and ended by him, shows him as a philologist in a favorable light. Among his further publications are: 'Die vornehmsten Wahrheiten der natürlichen Religion' (1754); 'Betrachtungen über die Kunsttriebe der Thiere' (1762); and 'Vernunftlehre' (1756). In the 'Wolfenbüttelsche Fragmenten eines Ungenannten' (published by Lessing in 1777-8) he made an application of the rules laid down in the last-mentioned work against the positive doctrines of Christianity. Until published by Lessing it was known only in manuscript to a few of his most intimate friends. It precipitated the well-known controversy between Lessing and Pastor Goeze of Hamburg. See LESSING.

Reims, rēmz. See RHEIMS.

Reinach, rä-näk, Joseph, French publicist and politician: b. Paris 30 Sept. 1856. He studied law at the University and was admitted to the bar in 1877, in 1881 became secretary to Gambetta and continued such until the fall of that minister. Having earlier devoted considerable time to journalism, he returned to that field in 1886, becoming proprietor with Denayrouse of 'La République Française.' In 1889 he was elected deputy by the arrondissement of Digne, and was re-elected in 1893, but owing to his attitude of criticism of the Dreyfus trial and his demand for a revision, he failed of re-election in 1898. He published a number of pamphlets on this celebrated case. He is also the author of 'La Servie et la Monténégro' (1876); 'Voyage en Orient' (1879); 'Le Ministère Gambetta, Histoire et Doctrine' (1884); 'Etudes de Littérature et d'Histoire' (1888-9); 'La Politique Opportuniste' (1890); 'Petites Catilinaires' (1888-9), being his articles against Boulangism published in 'République Française.' He edited 'Discours et Plaidoyers politiques de Gambetta' (1881-5), and 'Dépêches Circulaires, Decrets, Proclamations et Discours de Gambetta' (1870-1).

Reinach, Salomon, French archæologist, brother of Joseph Reinach (q.v.): b. Saint-Germain-en-Laye 21 April 1858. He was educated at the Lycée Fontanes and the Ecole Normale Supérieure and was appointed to the Ecole Française d'Athènes. He made a series of excavations and investigations at Myrina near Smyrna

in 1880-2 and in 1886 was an attaché at the Museum of National Antiquities at Saint-Germain-en-Laye. In 1890-2 he was assistant professor of archæology at the École du Louvre, was associate curator of the National Museums in 1893 and in 1896 was elected to the Académie des Inscriptions et Belles-Lettres. He has published: 'Chronique d'Orient' (1885-91); 'Description raisonnée du Musée de Saint-Germain' (1890); 'Répertoire de la Statuaire grecque et romaine' (1897-8); 'Guide illustré du Musée national de Saint-Germain' (1899); etc.

Reinbold, rin'bôlt, Adelheid. See BERTHOLD, FRANZ.

Reindeer, a very distinct genus *Rangifer*, of *Cervidæ*, unique in the possession of antlers by both sexes, though those of the female are somewhat smaller. The Euro-Asiatic reindeer (*Rangifer tarandus*), is the only domesticated species of the family. It extends over the boreal regions of the eastern hemisphere between about lat. 50° and 81°, and runs into several well marked varieties. The reindeer formerly had a much wider geographical range, and is probably the *bos cervi figura* described by Cæsar as inhabiting the Hercynian forests. Its remains are found associated with hippopotami in Pleistocene formations still farther south in Europe. The antlers are not alike on both sides, the great palmated brow tine being, as a rule, developed on one side only. In the winter the fur is long, grayish brown on the body; neck, hind-quarters, and belly white. In summer the gray hair darkens into a sooty brown, and the white parts become gray, owing to the shedding of the long hairs. To the Laplander the reindeer serves as a substitute for the horse, the cow, the sheep, and the goat. It is extensively employed as a beast of draft and carriage, being broken to draw sledges, or to carry men or packages on its back; the large race of Siberia and Kamchatka being used especially for the latter purpose. A full-grown animal can draw a weight of 300 pounds, and travel at the rate of 100 miles a day, its broad deeply cleft hoofs fitting it admirably for traveling over the broken snow. In winter the herds feed in the woods on the lichens which hang from the trees, or grow upon the ground, to secure which the shovel-like brow tine and the hoofs are employed to scrape away the snow; in summer they move to the valleys to feed on the herbage and shoots, and in autumn they seek the sea coast in order to escape the mosquitoes and gad-flies, where they feed largely upon marine algæ cast upon the shore. So important are these animals to the Laplanders that they, with their entire households, accompany them on these annual migrations. In 1891 16 head of domestic reindeer were introduced into Alaska by Dr. Sheldon Jackson for the benefit of the natives who frequently suffered for food, and for purposes of transportation. The experiment proved so satisfactory that larger importations were made in subsequent years and the number in Alaska has now reached about 10,000. In 1808 Dr. Jackson, as agent of the United States government, procured a colony of Laplanders to train the natives in the care of the reindeer. The Esquimos are the chief owners and their herds promise to become a material source of wealth. Whether alive or dead every product of the reindeer serves a useful purpose.

By European mammalogists the American wild reindeer or caribou, as they are called, are considered to be co-specific with *R. tarandus*, but American students recognize two native species with some six or seven sub-species. The woodland caribou (*R. caribou*) inhabits the wooded parts of British America and the United States border from Maine to Minnesota. It is larger than most varieties of the European reindeer, and both the brow and bez tines of the antlers are much palmated; those of the female are much smaller and little palmated. It frequents marshy regions, and feeds upon leaves, grass and shoots, but in some localities at least, migrates northward in the winter in search of tree lichens (*Usnea*, etc.) and reindeer moss (*Cladonia rangiferina*). The latter is a valuable lichen, which grows in great abundance in the north of Europe, particularly in Lapland, as well as on the tundras of Siberia and the barren plains of Arctic America. It constitutes almost the sole winter food of the reindeer. Linnæus says it grows so luxuriously in Lapland that it sometimes reaches a foot in height. The reindeers scratch it up from under the snow with their feet and antlers. On this plant their existence, as well as that of the Laplanders, to whom they are indispensable, depends. Its nutritive properties depend chiefly on the gelatinous and starchy matter of which it is largely composed. Its taste is slightly pungent and acrid. When boiled it forms a jelly possessing nutritive and tonic properties.

The Barren Ground caribou (*R. arcticus*) is a smaller species with larger antlers which occupies the more central and northern barren plains of British America. This species lives in herds of enormous size, said to rival even those of the bison of former days, and migrates regularly. In the winter it moves southward to the wooded belt where it meets but does not mix with the woodland caribou, and in the spring returns to the shores of the Arctic Ocean. See CARIBOU.

Much interesting information concerning the habits of reindeer will be found in the narratives of Nordenskjöld and other Arctic travelers. Besides these consult Caton, 'Antelope and Deer of North America' (Boston, 1881); Lydekker, 'Deer of All Lands' (London, 1898); Richardson, 'Fauna Boreali-Americana' (London, 1829); Jackson, 'Annual Reports on Reindeer in Alaska' (Bureau of Education, Washington, 1892).

Reindeer Moss. See REINDEER.

Reinecke, ri'něk-ě, Karl, German musician: b. Altona, Prussia, 23 June 1824. He was educated by his father, a composer, and in 1834 made a successful concert tour as a pianist, later becoming court pianist to the king of Denmark. He was appointed a teacher in the Cologne Conservatory in 1851, and in 1860 was made professor of piano and composition in the Leipzig Conservatory. He has become well known as a director and as a pianist and for his interpretations of Mozart. His compositions number nearly 200, are characterized by great refinement and have a distinctly classical and occasionally a romantic touch. They include: 'Serenade'; 'Aus der Jugendzeit'; 'König Manfred' (1867); 'Auf hohen Befehl' (1886); 'Der Gouverneur von Tours' (1891); etc.

Reinhart, rin'härt, Benjamin Franklin, American artist: b. Waynesburg, Pa., 29 Aug. 1829; d. Philadelphia 3 May 1885. At 15 he began to study art, and afterward took a three years' course at the National Academy, New York. In 1850 he went to Europe and studied in Paris and Düsseldorf. Returning to this country, he settled in New York in 1868. His most important works are engravings, and include: 'Cleopatra' (1865); 'Washington Receiving the News of Arnold's Treason'; 'After the Crucifixion' (1875); 'Evangeline' and 'Pocahontas' (1877); 'The Pride of the Village'; and 'Captain and the Governor' (1884); etc. To these should be added portraits of the Princess of Wales, Duchess of Newcastle, Carlyle, Tennyson, Charles O'Connor, James Buchanan, Gen. Winfield Scott, Stephen A. Douglas, and others.

Reinhart, Charles Stanley, American artist: b. Pittsburg. 16 May 1844; d. Philadelphia 30 Aug. 1896. He went to Paris in 1867 and studied at the Atelier Suisse; in 1868 entered the Royal Academy in Munich; and in 1870 returned to the United States. Besides noteworthy illustrations for magazines in this country and in Europe, he produced works in black-and-white, water-color, and oil, many of which were exhibited at the National Academy. In 1881 he again went to Paris where he resided till 1891, and was a regular exhibitor at the Salon. Later he became a member of the Society of American Artists, New York. Among his works in black-and-white are 'An American Abroad,' 'A Little Swiss Sojourn,' and 'Reichstag Sketches'; in water-color, 'Gathering Wood' (1877); 'At the Ferry' (1878), and 'The Spanish Barber' (1884); in oil, 'The Old Life-Boat' (1880); 'Washed Ashore' (1887); and 'The Rising Tide' (1888).

Reinhart, Johann Christian, German painter: b. near Hof 24 Jan. 1761; d. Rome 8 June 1847. He began his professional education as a divinity student in Leipsic theological school, but soon showed a very decided inclination for art and became a pupil of Oeser. He afterward attended the Academy of Dresden. The liberality of his patron, the Margrave of Baireuth, enabled him to visit Rome, where he fixed his residence. His compositions are rich, nobly conceived, and full of poetic beauties, but his coloring is wanting in softness and warmth. Of the great masters he most strongly resembles Swanevelt. Among the most excellent paintings of his later years are those in the Massini Palace at Rome. He was also successful as an etcher. Consult: Baisch, 'J. Ch. Reinhart und seine Kreise' (1882).

Reinhold, rin'hölt, Karl Leonard, German philosopher: b. Vienna 26 Oct. 1758; d. Kiel 10 April 1823. His parents destined him for the church, and sent him to study with the Jesuits in Vienna. When the order was abolished in 1774 he entered the college of the regulated priests of St. Paul (generally called Barnabites), where he became, at 22, professor of philosophy. He left Austria in 1787, and the same year was appointed professor at Jena, having written a celebrated vindication of the Reformation against two chapters in Schmidt's 'History of the Germans.' In 1794 he became professor at Kiel and remained there until his death. Among his other works are 'Über das Funda-

ment des philosophischen Wissens' (1791); 'Grundlegung einer Synonymik für den allgemeinen Sprachgebrauch in den philosophischen Wissenschaften' (1812). In his philosophy he followed Kant, Fichte, Bardili, and Jacobi. Consult 'Life' by his son E. Reinhold (1825).

Reinick, ri'nik, Robert, German artist and poet: b. Dantzic, Prussia, 22 Feb. 1805; d. Dresden 7 Feb. 1852. He studied painting in Berlin under Begas, and at the Düsseldorf Academy, and in 1844 settled at Dresden. He displayed superior artistic powers in romantic and historical subjects, and especially in such works as show the artistic union of brush and pen. Among his more important productions in art are 'Rachel and Jacob at the Well'; 'Well Near Olevano'; and numerous etchings contributed to various publications. To Rethel's 'Dance of Death' he furnished the poetical text and his other writings include: 'Song-book for Artists' (1833); 'Song-book of a Painter' (1837-44); 'Songs and Fables for the Young' (1844); Hebel's 'Allemanic Poems' (1851) which he translated into High German; 'Collected Songs' (1852); and 'Book of Poetic Fables and Stories.'

Reinicke, ri'nik-è, Paul René, German painter and designer: b. Strenz-Naundorf, near Halle, 1860. Beginning his professional life at Weimar in the studio of A. Struys, he afterward became a pupil of E. von Gebhardt at Düsseldorf. In order to extend still further his art experience he went to Palestine as a pupil and assistant of Piglhein, at that time painting his panorama of the 'Crucifixion of Christ,' and executed a considerable portion of that work. While his promise as a painter was very evident he abandoned the easel on returning to Munich and became chief illustrator for the 'Fliegende Blätter.' The wonderful skill he has shown in this department of art is well known and he has depicted aristocratic life in park and promenade, ballroom and theatre, with a truthfulness and grace, with a suggestive wealth of detail and consummate finish of execution which are unrivaled. A collection of his designs, under the title 'Spiegelbilder aus dem Leben' ('Reflections from Life') has appeared in heliogravure (1890).

Reinkens, rin'këns, Joseph Hubert, German Old Catholic bishop: b. Burtscheid, near Aix-la-Chapelle, Germany, 1 March 1821; d. Bonn 5 Jan. 1896. He was educated at Bonn and Munich, was ordained to the Roman Catholic priesthood in 1847, and became professor at Breslau in 1853. In 1870 he protested against the infallibility dogma and was suspended from his clerical offices and in 1872 was excommunicated. He became one of the leaders of the Old Catholic movement and in 1873 he was consecrated bishop of the Old Catholic Church with his official residence at Bonn and was recognized as such by the German government. He published: 'Hilarius von Poitiers' (1864); 'Revolution und Kirche' (1876); 'Lessing über Toleranz' (1883); etc.

Reinsch, rinch, Paul Samuel, American historian and educator: b. Milwaukee, Wis., 1869. He was graduated from the University of Wisconsin in 1892, from its law department in 1894 and after studying abroad, became professor of political science at the University of Wisconsin

in 1899. He is the author of: 'The Common Law in the Early American Colonies' (1899); 'World Politics at the End of the 19th Century as Influenced by the Oriental Situation' (1900); 'Colonial Government' (1901); 'Colonial Administration' (1903); etc.

Reis Effendi. See EFFENDI.

Reiske, rîs'kê, Johann Jakob, German philologist: b. Zöribg, Saxony, 25 Dec. 1716; d. Leipsic 14 Aug. 1774. He was educated at the University of Leipsic and devoted much attention to the study of the Semitic languages, particularly Arabic. Although abjectly poor he journeyed to Leyden where he gained access to the library and continued his study of Arabic. In 1758 he was appointed to a rectorship at the Nikolai Gymnasium at Leipsic, a position he occupied until his death, devoting himself to Greek literature in regard to which he became an authority. His works display a wide erudition and he succeeded in attracting public attention to the value of Arabic literature in the world of learning. He edited: 'Theocritus' (1765-6); 'Maximus Tyrius' (1774-5); 'Plutarch' (12 vols. 1774-82); etc.; translated from the Arabic and Greek classics and made the Latin translation of Abulfeda's 'Annales Moslemici' (1754). Most important among his writings is 'Animadversiones in Græcos Auctores' (6 vols. 1757-66). Consult: 'Autobiography,' edited and completed by his wife (1738); Morus, 'Vita Reiskii' (1777); Haupt, 'Opuscula' (1875-6).

Reit'boks, or Reedbucks, a genus (*Cervicapra*) of small South African antelopes, which have horns only on the heads of the males, and are never found far from water, affecting particularly marshy valleys and the reedy borders of the larger rivers. The type is *C. arundineum*. Other species are the roi rhebok, nagor and bohor.

Réjane, rā-zhān, Madame, stage-name of GABRIELLE (RÉJU) POREL, French actress: b. Paris 6 June 1857. She first appeared in 1875 in 'Revue des Deux Mondes' at the Vaudeville. She became known for her impersonation in melodramatic parts, particularly in the title-role of 'Madame Sans Gêne' (1893), written for her by Sardou. In 1895 she toured in the United States with much success. One of her later appearances was in 'La Passerelle' at the Vaudeville.

Rejected Addresses, a famous collection of parodies by the brothers James and Horace Smith, which was issued anonymously in 1812, and met with great success. They were written as a burlesque upon the many prominent and unsuccessful competitors for the reward offered by the management of the Drury Lane for an address to be delivered at the opening of the new theatre. Among the parodies the following are the work of James Smith: 'The Baby's Debut' (Wordsworth); 'The Hampshire Farmer's Address' (Cobbett); 'The Rebuilding' (Southey); 'Play-House Musings' (Coleridge); 'The Theatre' (Crabbe); the first stanza of 'Cui Bono' (Lord Byron); the song entitled 'Drury Lane Hustings'; and 'The Theatrical Alarm-Bell,' an imitation of the Morning Post; also travesties on 'Macbeth,' 'George Barnwell,' and 'The Stranger.' The rest are by Horace Smith. The 'Rejected Addresses' still hold a high place

among the best works of their kind ever written, and their extent and variety exhibit the versatility of the authors.

Relapsing Fever, a disease so called from the fact that during apparent convalescence a relapse of all the symptoms occurs; and this may be repeated more than once. It is also called famine fever, because it has occurred during seasons of destitution since 1739. Other names for it are seven-day fever and *febris recurrens*. It is infectious and contagious. The symptoms do not usually show themselves for three or four days after exposure to the contagion. They generally begin in a shivering sensation, with headache, and with muscular pains all over the body, but especially in the limbs; then the pulse rises, and the temperature increases; there is also great thirst, pain over the stomach, and retching. Sometimes there is intense hunger, and the patient becomes extremely prostrated. On the 5th or 7th day the symptoms abate, and there is rapid amendment until about the 14th or 15th day from the beginning of the symptoms, when a relapse occurs. Three or four days afterward convalescence again begins, and in the majority of cases it goes on to complete restoration of health. Relapsing fever is not often fatal, the death-rate being about two per cent of those attacked. The treatment consists in giving gentle laxatives and cooling drinks, a light nutritious diet, and in securing to the patient perfect quietness. Relapsing fever is known to be caused by a spirillum (*Spirochæta obermeieri*), a micro-organism which Obermeier of Berlin showed (1873) to be constantly present in the blood of those having this disease.

Relativ'ity. The relative is that which exists in and through its relation to something else, as opposed to the absolute, which is in and for itself. It follows, then, that every finite thing possesses only relative reality; for it is determined in all aspects of its existence by its relation to other things. Only what is infinite, and so all-inclusive, can be absolute. In the psychological sphere the so-called law of relativity is a statement of the fact that every state of consciousness is an element in the total complex of conscious life, and is therefore necessarily influenced and determined by its relation to the other elements with which it is connected. When applied to knowledge the law of relativity emphasizes the fact that knowledge is always a process in an individual mind, and depends upon the character of the impressions which the individual receives through his senses, upon his past experience, and general intellectual characteristics, as well as upon the purpose and interest that has led him to acquire any particular information. The arguments for the relativity of all knowledge, in so far as they have been used as a basis for skepticism (q.v.), have been answered by the general line of philosophical theory which points out that, in spite of individual differences of view and opinion, science presents us with a large and increasing body of propositions that are accepted as objectively binding on all. The progress of science may be described as the sifting out of such objective truths from the conflicting mass of individual beliefs and opinions. In one sense it remains true, however, that all human knowledge is relative. For such knowledge must always be

incomplete, and as incomplete can never express final and absolute truth.

Professor Philosophy, Cornell University.

Release, in law, is the name given to a common law conveyance, in which the word "release" is the operative verb. A release operates in five modes: (1) by passing an estate, as when a joint-tenant or coparcener conveys his estate to his co-joint tenant or coparcener; (2) by transferring a right, as when a disseissee (a person who has been unlawfully dispossessed) discharges his right to the disseisor; (3) by extinguishment, as the lord releasing his seigniorial rights to his tenant; (4) by enlarging a particular estate into an estate commensurate with that of the person releasing; (5) by entry and feoffment, as a disseissee releasing to one of two disseisors, which is equivalent to entry on the property and enfeoffment after putting an end to the disseisin.

Reliance. An American yacht. See YACHTING.

Relics, the mortal remains of departed saints; also, objects associated in memory with them, such as articles they used in life — clothes, vestments, the pectoral cross or the pastoral staff of a holy bishop, or the like: similar reminders of the life and death of Jesus Christ are also relics; and the religious veneration of all such relics when they are duly authenticated is expressly approved by the Catholic Church. The Council of Trent in Sec. xxv. of its acts and Decrees regarding invocation of saints condemns those who hold that "veneration and honor is not due to the relics of saints"; but all the Protestant churches teach that veneration of relics, or relic worship, is a sin of the nature of idolatry. In favor of the Catholic doctrine is cited the teaching of the early Fathers, who find both in the Hebrew scriptures and in the New Testament the highest sanction for the veneration of relics, for example, the incident of the coming to life again of a corpse on contact with the bones of the prophet Eliseus (Elisha: 2 Kings xiii. 21); and that recounted in Acts xix., 12 (compare v. 15), of sick persons being healed with "handkerchiefs or aprons" that had touched the living body of St. Paul: "there is a power," says St. Cyril of Jerusalem (*Catecheses* xviii.) "latent even in the bodies of the just." And the practice of the faithful in the first ages of the Church is fully consonant with this belief in the physical and spiritual efficacy of relics. The early Christians were careful to save the remains of martyrs from desecration. In the year 107 the bones of St. Ignatius, bishop of Antioch, were gathered and wrapped in fine linen, to be guarded thereafter "as a priceless treasure left to the Holy Church." In the year 167 the faithful of Smyrna exhumed the remains of their bishop, St. Polycarp, who had been burnt alive ten years before under Marcus Aurelius, and treasured them as "more precious than costly stones and more valuable than gold." When St. Cyprian, bishop of Carthage, was about to be decapitated (258 A.D.), the Christians cast towels and napkins before him that they might be soaked in his blood. After

the persecutions were over, the practice of veneration of sacred relics persisted in the Church, as is testified by the writings of St. Ambrose, St. Augustine, St. Jerome and indeed by all the Fathers of the 4th and 5th centuries. In all ages there have been abuses connected with the practice. A canon of the Fourth Council of Lateran in the year 1215 forbade relics to be sold or to be exposed outside of their cases or shrines, and prohibited the veneration of new relics till their authenticity had been approved by the pope; and these laws are confirmed in decrees of the Council of Trent.

Relief, in old English law, a fine or composition paid by the heir of a tenant, holding by knight's service or other tenure, to the lord on the death of the ancestor for the privilege of succeeding to the estate, which by strict feudal law had lapsed or fallen to the lord on the death of the tenant.

In physical geography, the undulations or surface elevations of a country.

In painting, the appearance of projection and solidity in represented objects, so as to cause them to appear precisely as they are found in nature.

Relief Sculpture. See SCULPTURE.

Religion became an object of comparative scientific study in the 19th century. Hegel (1770-1831) was the first to combine in its study the historical, scientific, and psychologic methods, though unable from lack of accurate and full data to attain valid results. F. Max Müller (1823-1901) applied the new science of philology to myths and thus identified the Dyaus Pitar of Sanskrit with the Zeus Pater of Greek, the Jupiter of Latin, and the Tiw Fader of Teutonic, which equation he declared the greatest historical discovery of the 19th century. He also urged that speech modified thought, so that myth was partly a "disease of language." This philological method was complemented by the anthropological one, founded by E. B. Tylor (1832-), who seeks the sources of myth not only in speech, but in the attempt to explain nature, in the attribution of inferred events to legendary or historical persons, and in the composition of myths to convey instruction. Furthermore he seeks light on religion from the rites and customs preserved in folk-lore.

Definitions of religion must be general enough to include its lowest and highest forms, and usually seem inadequate to religionists of the latter type. Definitions vary mostly as the animistic or naturistic element is made primary whereas properly they are coordinate. Animism is the worship primarily of deceased human souls, and secondarily of nature-powers upon the type of, or in close association with these. Naturism is the worship of nature-powers simply as man or animal, without analysis into body and soul, achieved by personification. Thus, E. B. Tylor defines religion as "belief in spiritual beings"; and Albert Réville, as "the sentiment of a bond uniting the human mind to that mysterious Mind whose domination of the world and of itself it recognizes, and to whom it delights in feeling itself united." But recognition of animism and naturism as coordinate sources of religion requires a definition of this type: Religion is the belief in and worship of supersensuous and superhuman being (beings

or a being). The term supersensuous denotes both personified nature-powers and dead human souls, while both possess superhuman power. Man must have been the source, one way or other, of the supersensuous, of life, personality, soul, or spirit; while nature's vast operations supplied the notion of superhuman power.

This belief in and worship of supersensuous and superhuman being, that is, a god, whether it were tree-god, storm-god, or sole god, became, when defined and established, a creed and a cult, the latter being worship by offering, prayer, dance, and the like. Every religion must and does contain these two elements, for each is implied in the other; yet their ratio varies greatly in various religions. Thus, Brahmanism insists mainly upon a round of ritual both daily and seasonal, whereas Protestant Christianity cares chiefly for conformity to a confession of faith. Cult and creed differ also in their ratio of change. Cult remains unchanged for centuries and even millenniums; whereas the creed, though it may remain firmly attached to the same cult, changes slowly under the influence of men's thoughts in other spheres. Each lags behind the current belief at any given time, which must be learned from individual writers and speakers.

Creed began in the symbols and myths wrought by imagination, which reason elaborated into principles and dogmas. A natural object becomes a symbol when associated with a human experience, as water, which has variously symbolized purity in Judaism, fertility in Hinduism, and humility in Taoism. The appropriateness of the last symbolism appears in that water always seeks the lowest place. A natural process becomes a myth when so associated, as the course of the sun, which has formed the basis of such divine histories as those of Amaterasu, Vishnu, and Apollo. The religious products of the imagination are as reliable and instructive as are its literary products in metaphor and allegory. These symbols and myths deposited by naturism usually form the earliest stratum of scripture for any given religion; then come the legends deposited by animism especially in its cult of heroes; and finally sober history closes the record.

The relation between creed or belief and cult or worship is simple and direct. Belief in the gods excites man to a sense of dependence upon them in that he hopes for good and fears evil from them. But his sense of freedom permits him to secure the good and avert the evil by means of worship. This was naively rendered by offering to the gods whatever was useful to man, such as food—both animal and vegetable, clothing, weapons, and ornaments. The natural accompaniments of these gifts were prayer and praise, which stated the grounds or conditions upon which the gifts were made. "Give us harvest that we may give you cake." Music and dancing were performed on the same principle; and, when lively, expressed joy, when slow, grief.

Religion as defined above is a cultural, that is, an activity proper and peculiar to man, and as such takes equal rank with the other cultural, industry, knowledge, art—whether visual or audible—and morality. Religion is as proper to man as any of these, for it springs from his normal impulses of hope and fear in presence of the world about him, whether nature or

human nature; and is as peculiar to him as any other cultural, for no other mundane creature exercises it. Religion, therefore, rests upon the same firm basis as the other cultural, namely, the undeniable and unalterable constitution of men and of nature, in both of which the Infinite is ever present, though in ever varying degree. Religion shares with other cultural also the vicissitudes and final high destiny of development. It began in vague and crude notions and practices; very generally progressed; and then either suffered arrest and sometimes even regress, or under better conditions and in spite of survival and revival of outgrown traits, attained its present high, though not yet perfected and therefore final stage. The causes of this development also are not different from those for other cultural, and may be formulated as follows:

(1) Direct Causation: The predisposing cause of the development of a cultural is the potentiality (constitutive norm or principle) of mankind, and more particularly of a single race, people, or man. This is heredity with variation. The exciting cause of the same is experienced nature and man. This is environment. From their community in these two causes there arises an analogy between all cultural processes.

(2) Indirect Causation: Each cultural stands in solidarity with each other, and therefore promotes its development. This is interaction. Whenever two or more human groups of various heredities and environments meet, their mutual comparison, modification, and complementation promote development. This is intercourse.

(3) Traits: Besides these laws of external causation, there are others of inner change. These are continuity, synthesis, differentiation with unification, and classification.

That religion is thus hereditary with man, or, to speak more simply, that man has a religious nature, appears certain from the fact that no tribe of men has been found without religion, as is now granted by ethnologists. As God did not make man and leave Aristotle to make him rational, so neither did he leave Moses (or Kongtze or Manu, or Zarathustra) to make him religious. After all other causes of progress have been allowed due weight, there is a residuum of effect which implies this inner growth of man as its cause. But religious nature would have remained mere potentiality forever, had not an environment of nature and fellow-man excited it to functioning. This accords with Leibnitz's maxim: "There is nothing in mind that was not previously in sense, except the mind itself." Of this environment, nature proved occasion for nature-worship, and man for ancestor-worship. Minor or major deities have been drawn from every kingdom of nature. Thus, the phallos and kteis were seen in water-worn stones, while trees yielded the sakaki, the pipal, the oak, the peach, the birch, and the mistletoe. Water, in the shape of wells, springs, rivers, and seas has everywhere received worship, as also has fire. The greatest gods have taken their source from sun and moon, wind and storm, heaven and earth, the last named always being a sexual pair. Divine honors have been rendered the serpent, fox, monkey, ox, jackal, and bear among animals. All these ob-

1. Mosque at Delhi, India.

2. Pool in Shaivite Temple, Madura, India.

jects could do some things beyond human power, and were credited with personality in so doing. Thus they became superhuman, supersensuous beings, that is, gods. To them man turned in his various needs, as the sources of his food, as the causes of events, as the vast or infinite beyond all finite, as the incomparably beautiful, or as the guardians of right. The other tap-root of religion was man-worship, whether of ancestors, heroes, or even living men. World-wide data indicate the following source for ancestor-worship. Primitive man explained his supposed temporary absence from the body in dreams by the action of a separable self, double, shade, image, or breath, as it was variously conceived. He could then explain death as the permanent absence of such spirit, and could present offerings, in return for which the dead person (supersensuous), now become also superhuman, afforded help and protection. If the deceased had been famous in war, invention, learning, or holiness, these offerings became public concern and thus hero-worship, as with Jimmu Tenno and Rama. Such a hero is sometimes worshipped while yet alive, as were Cæsar, Mikado, and Chaitanya. Besides the above objects of worship or creed, also the methods of worship or cult took their source from nature and man. Thus, the festivals at midsummer (still important in the Orient) and midwinter (New Year) were determined by the sun's solstices, as were those at spring and autumn by its equinoxes; while hours of worship were sunrise, noon, and sunset. The fourteenth and seventh days were successive divisions of the moon's 28-day period, and sacred alike in Judaism and Buddhism. The birth, puberty, and death of the individual called for ritual, while the hero added to these the dates of his victory, enlightenment, temptation, or the like. Nature gave the earliest sacred places, around tree, well, etc., while offerings to earth-gods were buried, and those to heaven-gods placed on hill-tops or burned to ascend in flame. The first sacrificer was father or chieftain, and the first sacrifices food, drink, clothing, weapons, etc. The remains of food or drink were consumed by votaries in what thus became a peace offering or communion. The accompanying prayer, music, or dancing were equally based on human models.

It was combined heredity and environment that imparted distinctive characteristics to the various religions. These are the emphasis on the future life by the Egyptians; the power and inscrutability of the divine among the Babylonians; loftiness and, later, ethical holiness in Jehovah among the Israelites; the duty of co-operation with Ahura Mazda to improve the world among the Persians; ascetic neglect of the world among the Hindus; insistence on the moral providence of Tien by the Chinese; visualization of the divine in beautiful forms and ennoblement of it by philosophic reflection among the Greeks; and, finally, the control of religion by state needs and hierarchical orders among the Romans. Even entire races have such characteristics. Thus, the Semites conceived their gods to be remote, austere, and self-centred, whereas the Indo-Celts made theirs immanent, genial, and related to man. The Mongolians approximated the Semites. The religious æstheticism that arose in beautiful Greece and the

pessimism in sultry India show influence from environment, but the unrivaled philosophic attainments of these kindred Indo-Celtic peoples must be attributed to heredity.

First among the indirect causes of religious progress is interaction with other cultural. Thus, in industry, writing made scriptures possible. In knowledge, philosophy guided the great reforms of the 6th century B.C., made by Lao-tze, Kongtze, Gautama, Buddha, and Xenophanes. The Renaissance was pre-condition to the Reformation; and ever since science has corrected and interpreted religion, doing so preeminently as the science of religion or hierology, of which this article is an outline. Moreover, there is a religion of science, inasmuch as what science reveals, religion construes as the will of God. Fine art mightily aided religion when it humanized the vague and crude nature-gods by means of the idols and pictures made to represent them, the temples to house them, and the music, dance, and drama to entertain them. What we know as Greek statues were mostly Greek idols and reflected their consummate beauty back upon their divine originals. Progressing literature and music have likewise given ever nobler expression to religion, and have thus advanced religion itself. Ideals of morality and law have improved both the creed and cult of religion. Early gods sometimes reflected the current cruelty or lust; and, as morality improved, were either corrected into nobler types as was done with Zeus, or vindicated by apology as with Krishna. Other gods with better mythical implications, like Tien, Agni, Jahve, and Apollo, were gradually transformed from the nature to the moral type as their worshippers improved. In cult it was morality that motivated the change from ceremonial to moral purity as the condition of approach to deity. Politics also influenced religion, because victory was attributed to the favor of the god, as when Jupiter became Optimus and Maximus over his rivals among the Latin tribes, and when the national experience of Judah led it from mono-latry to monotheism.

Industry, knowledge, art, and conduct still interact with religion, and, in combination with its own inherent growth, will decide the fate of extant faiths. Thus, all polytheisms, such as Shintoism and Hinduism, are doomed by the unitary conception of the world, which is held by science; and Mohammedanism must end or mend before sculpture and painting, which it now prohibits, as well as before morality, which it now violates by polygamy. This interplay of forces exemplifies the late laureate's insight that "God fulfils himself in many ways, lest one good custom should corrupt the world."

The inner growth of religion, further influenced by interaction with the other cultural as above explained, has developed an ever nobler conception of God in terms of personality, which can differ from the human only in degree of perfection, amounting, however, in the case of the monotheistic God to infinity. God is now apprehended as Infinite Person or Absolute Spirit, and worshipped because held to possess idealized human worth in each and every sphere of culture. No man has seen this God at any time. God was revealed by himself and discovered by man through the mediation of nature and humanity aided by the other cultural. This

process, however, affords no ground for reducing the notion of God to any of these terms; as when B. Spinoza, the pantheist, or D. F. Strauss, the materialist, would identify him with nature; or as when Auguste Comte, the positivist, would identify him with humanity. Similarly religion is not devotion to science, as J. R. Seeley claimed; nor a "creation of the spirit" by the same imagination that produces art, as Albert Lange held; nor, finally, is it "ethics heightened, enkindled, lit up by feeling," as Matthew Arnold taught. In particular Schleiermacher protested against this last misconception of God as a travesty of him into a universal policeman. God's function is not limited to being a judge, but includes every noble activity known to man. Religion is as unique as are the other cultural, none is false and none reducible to the other.

The other indirect cause of religious progress is intercourse among various human groups such as tribes, nations, or races. Comparison has afforded a superior religion increased confidence in itself, as when Aryans entered India. Modification of a religion has resulted from its introduction among other people, as when Buddhism overspread Asia. And complementation of one religion has been supplied by another, as when Confucianism, Taoism, and Buddhism made a religious compound in China.

The first trait or inner law of development is continuity. Nature makes no leaps in religion or elsewhere, but makes progress one step at a time. This law has made it possible to trace backward many a creed or cult through strange metamorphoses to primitive notion or rite. The law is so inevitable that even so-called founders of religion could effect their purpose only by reform of what they found at hand.

Synthesis was first observed by Hegel. Whenever a thesis exceeds moderation, it excites the opposition of some antithesis, with which it may finally coalesce into a synthesis of some larger fact that includes both. So, asceticism always tends to license, and *vice versa*, while both are sublated or taken up into normality. This was the consummate Greek insight, *mēden agan*, nothing too much. The prime example of synthesis in religion is modality, which results from excess of either one of the three mental functions in relation to the other two. Excess of volition produces the modes of moralism, legalism, or sacerdotalism; excess of intellection produces the mode of rationalism; and excess of emotion produces the mode of evangelicism, pietism, or mysticism. Ethnic religions begin with legalism as thesis, react to rationalism, and synthesize in mysticism. When a universal religion begins at synthesis as did Christianity, or at antithesis as did Buddhism, it passes to the other modes in due course. The perfection of stable balance can be only approximately realized either by individual or by people. All extant religions contain all three modes, and each mode should tolerate the other.

Differentiation with unification of quality also marks religious progress. The stone implements of various savage peoples differ little, and so do their religions. But civilized peoples show wide differences in religions. These are greatest where the peoples have moved apart,

as did the Indo-Celtic nations, some eastward into Persia and India, others westward into Europe; since this isolation involved differences in all the causes of development direct or indirect. A less differentiation arose from the same cause without isolation, as in the case of the numerous sects alike in Shintoism, Hinduism, Buddhism, Islamism, and Christianity. Later on, these divisions draw together into associations, unions, and the like, to secure greater efficiency.

The various stages of development afford the best basis for the classification of religions, and hierologists differ only as to the fittest marks of these stages. Probably the best classification is into tribal, national, and universal. The national or moral religions extant are Shintoism, Confucianism, Taoism, Hinduism, Jainism, Parseeism, and Judaism; while the universal or redemptive religions are Islamism, Buddhism, and Christianity. But every like is not the same, and wide differences exist within the bounds of either class. Thus, among the universal religions, Islamism is sensuous, Buddhism is at least negatively ascetic, but Christianity recognizes both normal humanity and ideal aspirations. Again, Islamism became universal only by force; Buddhism holds exclusive sway over only Ceylon, Burma, Siam, and Nepal, all decadent nations; whereas Christianity is confessed by the great world-powers. The principles of Christianity are the highest and its forces consequently the greatest attainable, but both await correct adjustment to society by advancing science, notably sociology.

Finally, no hierologist supposes that religion will ever perish, for it makes man at home in the world and thereby supplies his chief mental need. The Lord's Prayer expresses this central truth with such incomparable purity and simplicity that it now constitutes at once the best creed and the best cult, and seems assured of universal acceptance.

Religion, Established, or State Religion, that form of religious belief and worship which is recognized by the government or constitution of a country as national, and which enjoys certain privileges and is supported by the public treasury. The idea of complete separation of civil government and religious affairs is peculiar to modern times. In the ages before Christianity the administration of religious affairs was a function of the state and the priesthoods were orders in the state. After the triumph of Christianity the relations between church and state in the Roman empire were intimate, and the civil power freely intervened in the government of the church: the prelates of the church, too, were vested with extraordinary powers by the state. Throughout the Middle Ages the civil power was everywhere in the last resort the church's armed right hand for the enforcement of uni-

RELIGION.

formity in religion. For a long time after the Reformation the uniformity of religious belief and ceremonial was held to be indispensable: in the present age, though in many countries state churches exist, controlled by the public authority and supported from the public purse, uniformity is no longer enforced by civil penalties and the subject is permitted to reject the state religion, to embrace another religion, or to ignore religion, though usually dissidents from the religion of the state suffer certain civil disabilities. It is urged in favor of the national recognition of a form of religion, that if the majority of a nation are prevented from making this public recognition of it, as a matter of primary importance to the state's welfare, then they are subjected to coercion by the minority; and if an established church uses no sort of coercion, its being supported by the state in the face of a protesting minority is no greater violation of equal rights than would be its disestablishment at the behest of the same minority.

Religions, Congress of. See CONGRESS OF RELIGIONS.

Religious Art. Two large subjects are comprised in the expression, Religious Art: Religion and Art. The union of the two finds a development in practically all races, and a not too delayed one; for aspiration and sense of beauty are almost instinctive. The worshipful tendency in man which submits him to some more than human power as an object to be adored, served and propitiated, ranges from fetishism through idolatry, ancestor worship, polytheism, or the divinization of man, and abstract dualism of a controlling good and bad spirit, up to the Christian cult of one pure Supreme Being. The Art developed under Christianity, though generically included under Religious Art, and, like its other forms, exhibiting phases and modifications due to race, environment, influence or period, is apart from, and superior to them by reason of the higher ideals which dominate it. There is, moreover, no art which Christianity has not employed with distinction in its worship, and in the variety and profusion of such productions of a religious character, not a few may be regarded as exemplars in their respective fields, especially in architecture and painting. For this reason Christian Art demands special consideration, and will not be treated under the present head. See PAINTING; POST-RENAISSANCE PAINTING; RENAISSANCE PAINTING; ROMAN CATACOMBS.

"The first impulse to art is much the same, whenever or wherever it is felt in a race," says Lübke in his 'History of Art.' Naturally, these initial movements are of the most primitive character. Among relics of the Cave Dwellers are bowls with animals scratched or carved on them. Animal-worship is a rudimentary stage of Religion. In Egypt, coupled with ancestor-worship, it long retained a hold. The art of Egypt rose chiefly out of the latter. Some of the earliest structural efforts of Man have suggestion of Religion in them: for instance, the dolmens and cromlechs; the former, consisting of a stone placed transversally upon perpendicular ones, suggests an altar even more than a tomb: the latter, of a circle, or circles of stones surrounding a central monument. Architecture, sculpture, painting, and music are the

arts which have been most drawn on, and with the most important æsthetic results, for religion. Music, though adding notably to the dignity and exaltation of public religious services by its subjugating emotional appeal, leaves no impressive signs of its effectiveness, like the other arts, and needs no further mention — the more so, as it found nothing like due development except in the Christian Religion.

The oldest monuments, those of Egypt, are architectural, and sculpture and painting were, as a rule, subsidiary to this art. Painting in its full accomplishment is the latest of those arts. Among the older races, the Egyptians rank more prominently for the blending of Art and Religion, both as to antiquity, development and monumental survival, while the Hellenic Greeks were the most conspicuous and exquisite exponents of Religious Art of all the pagan races. Sculpture became for the first time an ideal art in Greece. Sculpture in Assyria, as well as painting, was mainly for the glorification of the monarchs. In Egypt, while religious and monumental, it was singularly conventional, its stereotyped figures showing scarcely any advance for centuries. This was undoubtedly due to sacerdotal restraint. Greece, which had borrowed much in her art from both these countries, shook off the narrow restrictions which fettered it in them, and forged ahead into an exquisite independent style, distinctively her own. The highest expression of it was Religion: for the temples of the gods, and statues of the gods and goddesses themselves, were the worthiest objects of artistic emprise. True, the divinities that the Greek chisel drew from the marble were but ideal forms of human beauty invested with suggestion of moral attributes of the loftiest natural conception.

This Art blended with Religion reached its acme in Greece, in the 5th century before Christ, the age of Pericles. The Persian wars had swept away Oriental despotism, and in literature and art the Golden Age was at hand. Pericles encouraged genius of every kind. "The Drama and Sculpture both elevated the National Religion," says Rio, in his 'L'Art Chretien.' The School of Phidias selected as some of its most inspired themes the divinities of the people for whom they worked. Pallas Athena, sprung from the brain of Jove, Goddess of Intellect, as tutelary divinity of Athens, the principal city of Greece, was naturally one of the most compelling inspirations of the sculptor's art. Nine statues of her were carved by Phidias, the master creator of that splendid art period. Sophocles, "great and pure genius," took devotedness, ennobled by the accomplishment of a great duty, as theme of predilection for his dramas. The exalted scope of the dramatists inspired sculptors and architects with their dignified and glowing conceptions. The severe but exquisite beauty of the chaste Athena was the sculptural embodiment of the Art Spirit of that glorious epoch, the ideal impersonation of contained strength and wisdom; just as the chryselephantine statue of Zeus for the Temple of Olympia, likewise the work of Phidias, was crystallization of the national idea of the Supreme God, a divinely human type of masculine perfection.

Venus, the goddess of a decadent age, was unable to inspire the people that worshipped her

with the virtues of which they stood in need; beautiful in the sensuous grace of art, but with the vivification of religious feeling evanescent. Rio, *a propos* of the Athena of Phidias, propounds a fascinating query: "Was she not the formula of a dogma lost long ago for the people but glanced at and put together by Platonic philosophy? The different traditions relative to her cult resemble the feeble rays of a primitive revelation."

The Amazon of Greek art was a transition from Minerva to Venus, and the best exponent of this transition in dramatic poetry was Euripides, less than Sophocles or Æschylus in the association of religion and art, but who exploited more than he is commonly credited with doing the religious side of national tradition and made war against mythological absurdities. There were fifty Amazons sculptured, life-size, in the porch of the Temple of Diana, in Ephesus: guardians of her whose favorite virtue was chastity.

No people ever reveled more in the joy of living than the Greeks, and the wine that inebriated them was Beauty and Religion. But if the gods were the theoretical object of their worship, the passion for Beauty, which led for the first time to the evolution of the Ideal in Art was probably a more constraining cult. Deities peopled his land to a Greek. In gratitude for the exhilaration which was aroused within him as the physical world poured through the portals of his vision, he returned thanks to the gods who ruled the earth, the sea, the sky, by erecting to them temples in which material, mass, line, and proportion blended into a dream of structural beauty, and by bodying forth in marble the human form with every physical and ethical grace possible to Man, and giving to them names of the gods. The aroma of their superhuman beauty has survived to this day. The Renaissance caught something of the Greek spirit, but not its exuberant vitality or creative glow. There is a higher religious beauty to the best paintings of the Christian artist to one who brings religious eyes to see them with, but, barring the charm of color and the tone and depth of its pigments, a religious Greek artist might look upon the Sistine Madonna with more curiosity than reverence, while even ascetic eyes of the period of the Renaissance must needs have felt a touch of exaltation before the Pallas Athena.

Egypt was antipodal to Greece in its religious art. The mythology of the region of the Nile was a blend centuries old. The sombre shade of death was its characteristic, as life was that of the Greeks. The Egyptian temple was massive, heavy, and provocative of chastened feeling. Through the centuries, the type persisted. The Greek temple appealed more to the spectator looking at it from without than to him who beheld its interior, and the severe Doric style was succeeded by the greater ornateness of the Ionic and the Corinthian. The Egyptian temple, like the Indian, consisted of a cluster of different parts enclosing a small sacred shrine in which reposed the god. A row of Sphinxes or ram-headed Colossi, all alike, and in an attitude of repose which expressed reserve and stolid dignity, but little grace, led up to the entrance: two similar façades convergent toward

the top with a narrow gate between. This entrance led to an open court with porticoes. Beyond were other halls, leading to the small sanctuary, or cell, only a few feet in dimension, in whose gloom reposed the god. There were no windows in the temples and the great wall spaces, as well as the columns and cornice, were covered with hieroglyphic inscription, figures of gods and of rulers, painted in bright, primary colors. There is no high ideal feeling in symbolic religious portrayal. The gods are distinguished from humans in the Egyptian paintings by different heads of animals and by the dress they wore. These animals were hieroglyphic signs of their names. Thus Thoth had the head of an ibis; Anubis, that of a dog; Hathor, that of a cow; the goddess of Neith, that of a lioness, and so on. The dress of the gods resembled the short ancient undress of women, and they had a special beard, longer by two inches than that of mortals, and turned up at the end. They are not living things like the Greek gods, but merely important symbols. The ancient mythology of Egypt supposed gods, then demi-gods, then the mysterious Manes. Ptah was the father of the gods, and his four sons, Ra, Shu, Seb and Osiris, represented respectively fire, air, earth, and water. Isis was the sister and wife of Osiris, and Horus was their son. Anubis was also son of Osiris. Set, the evil god, tried to destroy Osiris, who was protected by Horus. A symbol of Horus, a great sun-disk with widespread colored wings, was sculptured over the doors of the temples to drive away unclean spirits.

Another note of Egyptian art is the Uraeus, a venomous Egyptian serpent which always encircled the diadem of the Pharaohs, as a symbol of royal power, because of its swift effects for life or death. The sun-god, Ra, conquered the Uraeus for his diadem. Snakes were kept in the temples. Plutarch says the snake was revered as something sacred because of its power of gliding along without the aid of any limbs, like the stars.

Different cities were devoted to this or that special god. Memphis was faithful to Ptah. Abydos to Osiris, Denderah to the goddess Hathor. From the oldest records, the pyramid texts, the development of religion was complete and remained practically the same thereafter, though there were myths and much irreconcilable confusion. The sun-god, Ra, was common to all Egypt. There was a close relation between kings and gods and priests. The kings conciliated the gods by building and maintaining temples. King Tehuti-mes III. (1533 B.C.) built the temple to Osiris at Abydos. On an obelisk is an inscription "King Tehuti-mes has caused this monument to be erected in remembrance of his father, the god Herem-Khu (that is, Helios, the Sun)." Khames, son of Rameses II., was high priest of Ptah at Memphis, and did much to restore the worship of Apis, the living type of Ptah-Sakari. Osiris at intervals became incarnate in a bull with exotic markings. The Serapeum was the tomb of the bulls thus glorified by the indwelling of the god, who if they lived twenty years, were ceremoniously slain, and their exuviae preserved and revered.

Painting with the Egyptians was only a

kind of picture-writing, although interesting as decoration. Even subjects that seem secular and domestic had affiliation with religion which they would lack in another race. Agriculture was to be practised, for instance, in Elysian fields after death. The colors employed were black, green, red, yellow, blue, brown, and white. The colors employed for the pictured gods were vivid red, green, yellow, or blue. Religious, historical and domestic themes were treated with considerable uniformity. The worship of the dead, rites of burial, weighing the departed soul in scales, transportation of mummies in funeral barges, the king offering gifts to the god, are some of the religious subjects. A painted chronicle, that is the note of Egyptian Art. Leipsius calls the art of Egypt "a child: a strictly, heedfully, narrowly brought-up child." The child never grew up. A network of sacerdotal prescription enmeshed all the monuments of man's life and paralyzed individuality and originality in Art. Painting was not merely on flat surfaces. The Egyptians colored their bas-reliefs, and the designs incised deeply in the stone, which are called *bas-reliefs en creux*, or hollowed reliefs. The lotos, or water-lily of the Nile, was anciently used in religious rites and figured in art decoration. It was carried from Egypt to Assyria and has place with the fir-cones and honeysuckles, introduced in later sculpture in Nineveh. In India, it serves as a Buddhist symbol, the petals in the wheel-like form of the flower typifying perpetual cycles of existence.

The religious art of Egypt is inferior to that of Greece not only because of its being symbolic, restricted, sombre and heavy, but because the idea of divinity with the Egyptians, in Art, at least, was not anthropomorphic. Their gods had animal heads. A god, therefore, was non-human and monstrous in this respect, just as the hundred-armed god of the Buddhists is in Indian Art. Symbolism does not lend itself to idealism: hence its lack of development. The art of Greece and Egypt, however, affords the two most significant examples of religious art among the nations of antiquity. Roman art, borrowed from the Greek, and although it created no ideal forms in Art which were original, it produced sculpture only second to Grecian, either the work of Greek artists after the subjugation of Greece by the Romans, or imitation of Greek ideals by Roman sculptors. Sculpture as an accessory to architecture and in portraiture was carried to much perfection under the Roman emperors who succeeded Augustus. In the Arch of Titus, erected as a memorial of the conquest of Jerusalem, there was represented a procession carrying away the spoils of the Temple, including the Ark, and the seven-branched candlestick. Although this is not religious art, for it only commemorates an Imperial victory, yet it is mentioned as interesting that the two art products of the Jews which were most sacred should thus be exhibited as a note of the triumph expressed in a monument to the glory of a pagan emperor. Cameo-cutting and bas-reliefs on sarcophagi were artistic productions finely executed, in the decline of the Roman Empire, when the arts had also declined.

In architecture, the Romans copied and

modified from Etruscan buildings in their earlier work and from the Greeks in their later. They brought the arch and the vaulted roof to great perfection. The Corinthian order, which they largely affected, was modified, in their efforts to lend it fulness and strength, into the Composite or Roman order. The Pantheon of Rome, the finest monument of Roman architecture, was built by Agrippa (13 A.D.). It was one of the grandest buildings of the ancient world. The Tomb of Hadrian, the Castle of San Angelo to-day, surmounted by an angel, surpassed any sepulchral monument of its time.

The religious art of the other nations of antiquity was inferior to the manifestations of it already recorded. There is no sculpture or painting of an early date in Chaldæa or Babylon, though Chaldæan traditions have been the foundation of the arts of western Asia. They worshipped heavenly bodies and the temples were also observatories. Phœnician Art (q.v.) is a mixture of Assyrian and Egyptian. In Assyrian art there are winged figures of bulls with bearded human heads. There are no traces of Median art. The religion of the Persians was based on a dualism of essentially moral character. The Kingdom of Light or Ormuzd, Goodness, is opposed to the Kingdom of Ahriman or Darkness. In Persian art (q.v.), the King is represented worshipping Ormuzd, the God of Light, with Ferouher, or Wisdom, over his head, as a man with the wings and tail of a bird. The stone altars on the mountain tops are the chief monuments of Persian religious art, though it was really the followers of Zoroaster who venerated fire as a symbol of the Deity, Ormuzd.

Religious art in India appears to have begun with Asoka, who adopted Buddhism, and was the Buddhist Constantine. Buddhist architecture is the oldest style, and it embraces monasteries hewn out of the solid rock; high memorial mounds, or Topes; Pagodas, detached buildings surrounded by a series of walls, and Mosques, built by Mohammedan conquerors who brought their own style with them and combined with it native ornamentation. In the very first period Indian art attained a distinctive style, which was employed in religious monuments. The Brahminical sects adopted it and later it was transformed by profane ornamentation. The founder of Buddhism, Gotama Sakyasinha, reformed the old Hindu pantheism, Brahmanism. He is represented seated on the sacred lotos which is supported by the avatar of Sakya, the lion. There is some similarity between the Buddhist temples and those of Christianity. Rows of pillars separate the nave from the aisles, and a small dagoba, or shrine, rises at the end of the cave (the temples were originally monasteries cut from the rock) in which is the seated image of Buddha. This is where the altar would be in a Christian church. The Mosques are the most remarkable of all the Indian buildings.

Mohammedan religious art has peculiar restrictions and yet quite a distinct character. "Images," it is said in the Koran, "are things to be held in abhorrence." Tradition also ascribes to Mohammed's oral utterances this one: "Woe unto him who paints the likeness

RELIGIOUS EDUCATION

of a living thing: on the Day of Judgment those whom he has depicted will rise up out of the grave and ask him for their souls. Then, verily, unable to make the work of his hands live, will he be consumed in everlasting flames." With figures thus barred, the art of the East is mainly decorative. All races alike begin with surface decoration, whether wall painting, glass painting or tapestry. But the evolution of Western art led to the treatment of a flat surface in a way to remove the sense of flatness. Color is only a means in painting that has reached a developed state, but it remains an end in itself for the East which regards it as an ornament, and the Oriental feels no need of anything in art that transcends ornament. Arab predilection for this, and the exclusion of animal forms, lead to designs in which geometrical figures, vegetable forms, and letters or sentences from the Koran are the elements. With sculpture banned as to its principal object, and only flat ornament of conventional design, there is not much to be said for Mohammedan religious art in sculpture and painting. The same color effects are found in secular and in sacred buildings. In the beginning, Mohammedans found that Christian churches served well enough for their religious rites. The earliest mosques were built by Christian architects. Almost every new style of architecture is the result of the requirements of a new religion. Gradually, therefore, the Arabesque style of decoration asserted itself, and the horseshoe arch originated in their architecture. This novelty became and has continued a distinctive feature of Mohammedan Architecture.

In a mosque, a portico surrounds a fountain for ablutions: in the southeast part is a pulpit, and in the direction in which Mecca lies is a sacred niche (Mihrab) toward which the faithful must look when they pray. Opposite the pulpit was a desk for the Koran. The simplicity of the earlier mosques gave way to an infinite variety of arcaded courts, gateways, domes and minarets, the dome constituting the leading feature. The Moors introduced a ceiling known as the *stalactite*, which became as distinctive of their architecture as the horseshoe arch. The minarets are tall towers of several stories from which the muezzin calls the faithful to prayer. Sometimes the outside of a mosque is without ornament: but the flat surfaces of the interior are always profusely decorated in the richest colors.

Arabian art first acquired a distinctive character and a settled style in Egypt, but Saracenic Art touched its highest beauty in Spain. Everywhere lavish color and profuse ornamentation remain its features. When the Mohammedans conquered Constantinople, 1483 A.D., they took Santa Sophia as their model and thereafter their buildings are more or less perfect copies of that work of Justinian. The Mosque of Suleiman II., at Adrianople, is an exact copy in plan and form, though differing in detail. The Mohammedan's chief thought was religion, and he made all the arts subservient to it. The most beautiful Persian and Turkish rugs are prayer-rugs. The Smyrna prayer-rugs have a plain centre, green, blue, yellow, ivory, or red, with the prayer point supported by two columns, from which hangs a lamp. Sometimes, the pillars are omitted and there is a modification of the

Tree of Life. Bokhara prayer-rugs have the centre field divided into four sections by a large cross. At the appointed hour for prayer, the devout Mohammedan spreads his prayer-rug with the Mihrab (niche) toward Mecca, and prostrates himself, his head resting on the rug at the point, his hands outstretched. There are small prayer-rugs for the children, and occasionally rugs have two or three niches, as if intended for a family rug. The most exquisite rugs are sent to Mecca as propitiatory offerings. The mosque at Meshed is famous for its gorgeous carpets, whose soft, glowing colors harmonize exquisitely with the iridescent effects of the tiled walls.

A reflection made by A. F. Rio, in the introduction to his '*l'Art Chretien*,' is interesting as a theory to account for the note, so to speak, of religious beliefs of the various peoples, which flowed more or less into productions of their art. It may serve as conclusion to this article. He says: "There is a point of view which dominates all the others in the respective doctrines of the peoples of antiquity: that, namely, which shows us the special vocation of each race in the religious dogma which has determined more particularly its intellectual and moral development, and which has been assigned it as its proper inheritance from the debris of primitive beliefs, after the catastrophe which had as a consequence the dispersion of the human race."

"The share that fell to Indians (East) was the dogma of the divine incarnation, on which they have constructed their gigantic epics: that to the Phenicians, the mysterious dogma of an original prevarication which demanded incessant expiation through immolation of human victims: that to the Persians, the constant antagonism between the two Principles which dispute for the empire of the World and that of Conscience: that to the Egyptians, the dogma of immortality in view of the recompenses and chastisements after death: that to the Greeks, the double degradation of man through his fall, that of the body and of the soul; as if this privileged race had heard distinctly through the rumbling of the ages only these words of Genesis: 'God created man after His own image.' This race gave itself instinctively the mission of rehabilitating the human creature as well in his faculties as in his form: in a word to introduce into the world the notion of the Ideal. Another even more privileged people, the Jews, had been appointed with view to their honor of the True, as the Greeks were to the honor of the Beautiful."

Sir W. M. Conway finds the art in which different peoples have excelled due to the ideal they strive to express: that of persistence, among the Egyptians resulting in architecture; of reserve, among the Greeks, in perfect sculpture; the Medieval ideal producing chivalry, feudalism and Gothic architecture; the Renaissance ideal, study of antiquity, revival of learning, tendency toward despotism in government, and the great Italian and German schools of painting.

JOHN J. A. BECKET, PH.D.,

Of 'The Art Interchange,' New York.

Religious Education. Religious education is a phrase (recently become technical) to

RELIGIOUS EDUCATION

denote a particular type of education which makes full use of the religious and moral forces in human development. The rise of this new educational ideal is due to a better understanding of the processes of mental and spiritual growth, to better methods in child training, and to better knowledge of the Bible as the primary means of religious and moral instruction. Historical and psychological study have brought in a new era of thought, for they teach us to look at the past not as a flat picture, but as one having shading and perspective. The story of the past is a story of development; the race has slowly grown, stage by stage, from the most primitive condition to the present relatively high plane of civilization. Man has progressed physically, intellectually, morally and spiritually through the ages.

In this development religion and morality have been chief factors. Progress has been largely accomplished under the guidance and stimulus of the religious and moral instincts native to mankind. There has been an increasing perception of truth, right and goodness, an ever higher idea of God has been gained, and it has become recognized that the Bible is a record of this spiritual experience and growth of men.

Religion is no longer conceived as a mystical and unrelated element in life, coming and going without any known order, an intermittent activity in his world of an absentee God; instead, religion is that essential element or attribute of finite personality which unites it with the infinite, and promotes the development of the highest humanity. Also the Bible appears, not as an epitome of all knowledge, cast down from heaven complete, to make human experience and thought unnecessary, but as a helpful account of the religious experiences and ideas of the past as men have progressed under God's guidance and blessing toward the divine ideal.

One great discovery of modern education is that, since the individual is an organic unit, the true education for him must be an organic unity. The whole man is the subject of education; he does not develop piecemeal, first on one side and then on the other; he does not grow by the attaching of one kind of knowledge to him on week-days and another kind on Sunday. He develops by an innate process. The chief object of education is not to supply information, but to develop character and social efficiency. The distinction between instruction and education is clarifying: instruction is the act of imparting information, education is the process that includes all means of development. Education includes instruction as one of its features, but it is a world-movement which makes for the realization of world-ends. The clearest analogy for education is drawn from plant life: the acorn grows into the oak because of its own inherent vitality and destination; it is assisted in this growth by the soil, the rain and the sunshine. Similarly the child grows into the man because it has the potency and destiny of manhood; it is assisted in this growth by an environment which if ideal contains all those elements that are most helpful to physical, intellectual, moral and spiritual development.

The business of religious education is to create this ideal environment for every child, so that his growing personality may lack none of those things required for perfect self-realization. Religion cannot be thrust into the child by instruction in the dogmas, the ritual, or the history of ecclesiastical institutions; religion is rather a force within the child which makes for his highest development and well-being. Religious education must therefore operate to give this inner force the best possible opportunity to accomplish its results. For this reason the best education is religious education, that is, an education which recognizes the function of religion in human development and makes due provision for its contribution. All education is essentially religious, for religion seeks the highest development of men individually and socially, and all that contributes to this end is religious.

Here also morality finds its close connection with religion. Our conduct toward ourselves and toward others springs from our view of life, our sense of duty, our conception of goodness. These belong to human personality; they arise within one. They constitute the religious elements of mankind; they are factors of our development. Religion therefore finds one of its chief ends and expressions in conduct. Not all ethical feeling and instruction rest consciously or confessedly on this religious foundation; but if religion is what it is here supposed to be, religion does in fact determine humanity, for the principles of conduct are those which grow out of one's world-view.

With regard to the material which may be used for religious education, it is now clearly seen that the child is not a miniature man, capable in a degree proportionate to his size of all the sensations, emotions and ideas of grown people. Children do not have and cannot have those theological ideas, spiritual upheavals, mental struggles and moral experiences which belong to adolescence and maturity. Therefore literature or material of any kind which describes or is designed to arouse or to inculcate these phenomena of adolescent and adult life is not adapted to children, and should not be used in teaching them. This means, for instance, that the Bible, which largely records adult ideas and describes adult experiences, must be wisely used with children. Only such material as is appropriate to the several stages of human growth should be employed in the religious training provided for these stages. And other material from outside the Bible which can be made helpful to children in their development should also be used at suitable times and in suitable ways. It is clear that the Bible, rightly interpreted and rightly used, will be the most valuable literature for religious education. This is just because the Bible gives a religious history of that nation in the past which achieved the noblest religious ideas and the highest religious experiences. But it will also be found that there has been much true religious thought and experience, pre-Christian, non-Christian and Christian, which has found record in other literature than the Bible: these writings, too, whether past or present, will be used as they are qualified for promoting religious education.

RELIGIOUS EDUCATION

In addition, there is the religious thought and experience of the present time, written and unwritten. This means of religious nurture is largely ignored. The great religious events, activities, ideas and experiences of the past are made much of, while the great religious events, activities, ideas and experiences of the present are regarded as without official approval, or too commonplace, or too progressive to be treated as material for religious education. The virtues of living men, the heroisms of every-day life, the deep significance of present events, the value of scientific discoveries, the helpfulness of new truth and of the re-statements of old truth, modern missionary movements, modern charities institutional and individual — these and other phenomena of religion and morality in our own day should be wisely and faithfully used.

The religious education of the present time is being given to the rising generation by a large number of agencies. The common notion that the home, the church and the Sunday-school are practically the only teachers of religion and morality is erroneous. These are certainly the primary agencies, but there are also the universities, colleges, and public and private schools of all grades; the Young Men's and Young Women's Christian associations; the Young People's societies of all sects and kinds; the libraries which are greatly extending and augmenting their effectiveness; and the public press, of which the religious papers exercise some influence upon a limited number of readers, while the daily press is now one of the greatest means of spreading religious and moral ideals.

Of general education in America the chief instrument is obviously the public schools. The entire period of development — childhood, youth and adolescence, from six to eighteen (or even to twenty-five) years of age, is now conducted by the state, which undertakes to bring the child into possession of the general knowledge, skill and character which are regarded as necessary to good citizenship. Increasingly the American people have turned their children over to state education, expecting it to develop them completely into manhood and womanhood. The home and the church contribute less than formerly to the education of the whole rising generation, because of the multiplicity of interests and the pressure of business on the modern home, and because of the obsolete or ineffective ideas and methods of many of the churches. The belief widely prevails that modern education is complete without that special religious training and knowledge of the Bible which previously were required. The argument runs thus: the education furnished by the state, under the direction of the ablest educators, may reasonably be understood to embrace all those elements of culture which are essential to a complete development of the young; and since the public schools make little or no specific use of the well-known means of religious and moral instruction, these should be considered as no longer necessary to a perfect education.

But the state should enlarge and improve its education in accordance with the best pedagogical ideas to meet our national needs; it should include in its aims and methods all those elements which are necessary to a full develop-

ment of men and women. Essential elements of education like religion and morality cannot consistently or wisely be left to other institutions to supply *in toto*, for two reasons: (1) these other institutions, such as the family and the church, often fail, wholly or in part, to make their proper contributions to the growth of the child; (2) no true education is possible where the essential elements are given in isolation instead of in correlation.

Certainly the home should follow a higher ideal and should achieve a greater efficiency; parents should anew consecrate themselves to the work of making the home the best possible environment for the growing child, where influence, instruction and stimulus will cause the best that is in the child to appear; particularly the religion and morality essential to the highest development should here enter into the environment so as to direct the growth of the child. The public schools cannot accomplish perfect results when they must do the work of the home in addition to their own.

The church also should set itself to learn its true function in the present time, and to discover how it can perform this. Some individuals and denominations of the church have made effort to adjust themselves to the progress of civilization, to the expanding ideas of modern thought, to the improved world-view, to the change of interest from speculation to actual life, and from an extreme individualism to a vastly better conception of men as interrelated and mutually dependent upon one another for higher development. But generally the churches have stood for the ideas, methods and viewpoints of the past; they have wished to confine advancing civilization within the bounds of previous centuries; they have sought to perpetuate doctrines and practices which were once expressive of current thought and experience and were therefore useful, but which have been superseded by clearer vision of truth, by a better interpretation of the Bible, and by changed ideas concerning the best way of doing things. The church is indeed the great conservative force in human civilization, and a conservative force is essential. But conservatism should not become obstructive, hindering growth and resisting progress.

The present movement for religious education, outside the practice of the Roman Catholic Church, which has always insisted on religious education, has come out of the educational world rather than out of the church, because of the inertia and narrowness of ecclesiasticism. It is inspired and guided by men who belong to the church and represent its best product, but whose life-work has been in the field of education. Certain branches of the church have made much of education; in America, in former years, the schools and colleges were often church foundations, to train the ministry and to spread intelligence in the interest of religion. But now the public schools have no relation to the churches; and many private schools which were formerly church schools have freed themselves from ecclesiastical supervision. The educational world has kept step with progress, and from it has come the demand that religion and morality shall be restored to their true place in educa-

RELIGIOUS LIBERTY

tion. This forward movement arose during the 19th century, gaining clearness and force as the sciences of psychology, pedagogy and history advanced, until with the opening of the 20th century the movement in America reached such a stage of development that a new era may be said to have been inaugurated.

The most conspicuous evidence of this was the establishment of the Religious Education Association at Chicago in February 1903, by one of the most remarkable conventions ever held in the United States. This representative national organization, in its second year only, consists of some 250 officers and 2,000 members, including many of the leaders in the religious and educational activities of our day. The purpose of the association is to unite for mutual helpfulness all those who are engaged in religious education through whatever agencies or means; to improve the current religious education by thought, conference and investigation; to promote such education by spreading approved ideals, principles and methods; and to increase the efficiency of all individuals and agencies by unifying, stimulating and developing all those forces which together can secure to religion and morality their true place and their proper influence. The association simply gives expression to the widespread popular demand that education shall make use of religion and morality according to the best light that has now been attained regarding these vital elements of human development. See PARISH SCHOOLS.

CLYDE WEBER VOTAW, B.D., PH.D.,
Assistant Professor of New Testament Literature in the University of Chicago, Editorial Secretary of the Religious Education Association, Chicago, Ill.

Religious Liberty, or Liberty of Conscience, is the recognition and assertion by the state or government of the right of every man, in the profession of opinion and in the outward forms and requirements of religion, to do or abstain from doing whatever his individual conscience or sense of right suggests. Religious liberty is opposed to the imposition by the state of any arbitrary restrictions upon forms of worship or the propagation of religious opinions, or to the enacting of any binding forms of worship or belief. The limit of religious liberty is necessarily the right of the state to maintain order, prevent excesses, and guard against encroachments upon private right. The principle of religious liberty has come very slowly to be understood. The state of the ancient world in regard to questions of liberty of conscience was somewhat different from that of the modern. Many national religions did not make universal pretensions, and within their limits there was considerable latitude; the worshipper of one god did not necessarily impugn the authority of another. Yet instances of intolerance are to be found, as in the case of Socrates, even in the most liberal states. When Christianity appeared the case was altered, and it speedily drew on itself a treatment different from that which merely national religions had received from the rulers of the world. Christianity early developed within itself sects which did not manifest toward each other a very tolerant spirit; but it was only

when the civil power had been gained to its side that these differences could assume the form of open repression and persecution. It was then found that the persecuting spirit could distinguish a church not less than a secular government, and, indeed, that from the constant occupation of the former with religious affairs the danger of persecution from it was much greater than from the most intolerant civil government. In the organization of civil and ecclesiastical government which prevailed from Constantine to the Reformation persecution was in general only limited by dissent, and universal submission to the dominant church became the condition of religious peace throughout Christendom, while religious liberty was unknown.

The contest of opinion begun at the Reformation had the effect of establishing religious liberty, as far as it at present exists, but the principle itself was so far from being understood and accepted in its purity by either party that it hardly suggested itself even to the most enlightened reasoners of that age. The contest between the reformers and the church was primarily one of authority; and so great was the regard of the former to the authority of their own confessions, that in Germany itself the common dangers they encountered from the Roman Catholics could hardly keep the Lutherans and Calvinists united during actual hostilities.

In Great Britain even civil liberty, jealously maintained, was not understood, by the dominant party at least, to import religious liberty. Active measures of intolerance were adopted against Dissenters in the reign of Queen Anne. Even in the reign of George III. conditions were attached to the toleration of Dissenting preachers. It was not till the 53d year of this reign that Unitarians were included within the benefits of the toleration acts.

Religious liberty was introduced in Prussia by Frederick the Great, but contravened by his immediate successor. The state at present in Prussia, without, perhaps, actually dictating to private individuals, maintains a vigilant control over ecclesiastical organization, the education of the clergy, and all public matters connected with religion, which only do not affect religious liberty if they are strictly confined to state-protected churches.

Joseph II. of Austria found his Protestant subjects sufficiently advanced to be beyond the need of his control, and reserved such persecution as he was disposed to exercise for the Roman Catholics. By his religious reforms he excited a revolt among his Belgian subjects, which was only terminated under his successor. Religious liberty has only been established in Austria during the present reign. Italy first enjoyed the same advantage under Victor Emmanuel II. The government of France, even since the Revolution, has always been of so paternal a character that it is still somewhat doubtful on what foundation the liberties of Frenchmen rest. In Italy the Waldenses were emancipated in that year, 1848, which marks a new era of religious progress throughout Europe. The constitutions granted at that memorable epoch guaranteed the free exercise of divine worship. Since 1870 the Free Italian churches and many others have sprung into life. In Spain religious liberty dates its feeble beginnings from 1869. Concessions are neutralized by certain restrictions, for the con-

RELIGIOUS ORDERS—RELIGIOUS SECTS

stitution of 1876 limits the liberty of those who are not Roman Catholics to worship in private houses.

In Holland and Scandinavia, even with church establishments, perfect religious equality is enjoyed. And by the treaty of Berlin, 1878, the sultan's government was forced to this position, that in no part of the Ottoman empire shall difference of religion be alleged against any person as a ground for exclusion or incapacity as regards the discharge of civil and political rights, admission to the public employments, functions, and honors, or the exercise of the various professions and industries. The outrageous persecutions which have fallen on the Armenians in contravention of this treaty, and which the powers of Europe failed to prevent and punish, are among the burning shames of a century which won many victories for the right of rights.

The area of toleration has been enlarged by the official action of China in granting to the different European nations the right of sending Christian missionaries, not only to the port cities, but to the interior of that vast empire. The Chinese government has given repeated assurance of its belief that the doctrines of Christianity and the practice of them were for good. The fanatical uprising of those who hate all foreign influences will not permanently diminish the area of religious liberty in the Far East.

America is the great home not so much of toleration as of true liberty. In the United States the government has no authority to interfere with religion. The fullest liberty is possible only where the church and state are separate. From the beginning of our organized national life this separation has prevailed and been the fundamental law and practice of our country. Here the Jews have had freedom and have been treated with a friendliness never elsewhere shown to them. America is the standing reply to those who believe that religion needs the support and guidance of the state. Christian progress in our country has been more rapid than the progress of the population, and it is as true to-day as when De Tocqueville wrote that "there is no country in the whole world in which the Christian religion retains a greater influence over the souls of men than in America."

Probably in no other country than America could such a Congress of Religions have been held as that which was the crowning feature of the Columbian World's Fair at Chicago. By that remarkable gathering the bonds of brotherhood and of true toleration were enlarged. Roman Catholics and Protestants for the first time sat together in a great assembly for 17 days in the spirit of fraternity and kindliness. The representatives of the great non-Christian faiths were treated with perfect courtesy, and illustrated the spirit of courtesy themselves. Many Christians learned a new lesson, following the teachings of Sir Monier Williams, not to shut their eyes to any truth or virtue which may be found in the non-Christian characters and non-Christian writings.

From this review it appears that toleration has been slowly advancing since the Reformation, and that its recent progress has been extensive. Even in the most advanced countries, however, the state of public opinion on this subject is still far from being satisfactory. Liberty

is correlative with responsibility, and as on philosophical grounds a man cannot be held responsible further than he is free, so in practical affairs no man can competently discharge his responsibilities who is denied freedom of action. Religion primarily concerns the conscience, which is the seat of human liberty, if that liberty exists anywhere. The value of religious observances depends upon their being the expression of religious thoughts and opinions. To compel a man who holds certain opinions to observe certain practices corresponding with them is to deprive him of the opportunity of giving free and natural expression to his opinions. If this is done in religion he is deprived of the natural outlet for his feelings of reverence and devotion. The spontaneity necessary to the discharge of his avowed responsibilities does not exist, and his religious life is thwarted and deadened. Thus compulsion in religion is injurious not only to those who resist, but still more to those who acquiesce; and freedom is indispensable, as much for the protection of those who are in the right as for those who, in the view of authority, are in the wrong. The religion which is imposed by authority is the religion of the rulers and not of the ruled. Consult: Johnston, 'Religious Liberty in Maryland and Rhode Island.'

Religious Orders. See ORDERS, RELIGIOUS.

Religious Sects. From the earliest days of the world's history man has been more or less a religious creature. Almost invariably he has had a god, or several of them, to whom he looked for protection. At times these gods have been crude fetishes of whittled wood or roughly hewn stone; at times they have assumed the form of animals or reptiles, or have appeared as cruel monsters eager for the life-blood of those who revered them. But, however they may have come, man has worshipped them, because religion, as represented in the worship of a supernatural power, is interwoven with the entire fabric of human nature. The religious "sect," however, is of more recent origin, for while primitive man could worship his crude fetishes blindly, it was necessary that he should learn to think before he could attempt to distinguish between the various attributes of the Infinite, that from them he might construct those well-marked divisions of faith, or creed, which are such an inevitable result of the varying phases of human thought. To-day the term "sect" is applied to those bodies of men who have announced their decisions to follow the opinions or doctrines of some philosophical or theological teacher. Of course, to the Roman Catholic all religious bodies that are not actually in affiliation with her communion are classed as sectarian, but such a definition is not the general one, the word "sect" being used to differentiate separate organizations rather than to call attention to comparatively inconsequential differences of opinion. Thus, for example, the High and Low Church factions in the Church of England, or, in this country, the Protestant Episcopal Church, are not regarded as separate sects but as parties, or schools, within the same communion; whereas the various bodies of Baptists in America are denominated as "sects," not so much because of their differences in doctrinal matters, which in some instances are slight, but for the reason that they are under

RELIGIOUS SECTS

separate church government. While there were sects among the ancient Jews and Greeks the coming of Christianity, with its wide field for speculation, opened the way for a more general promulgation of individual opinion, and the following list of the most important organizations of this and other days indicates that there has been no lack of teachers and prophets to preach new gospels to those who would hear:

Abednarians.—A sect of German Anabaptists, led by Nicholas Stork, a weaver, who opposed the simplest forms of education, even the learning of the A B C's, on the ground that it prevented divine illumination and hindered spiritual sanctification. Extinct.

Abeltes.—An African sect which opposed procreation on the ground that it was a perpetuation of sin. Extinct.

Abrahamites.—An obscure Bohemian sect of deists. Its members rejected all distinctively Christian doctrine, with the exception of the Lord's Prayer, which they used, adopting the tenets of the religion of Abraham as contained in the Decalogue. Extinct.

Abyssinian Church.—That branch of the Christian Church that has been established in Abyssinia for many centuries. It is in agreement with the Coptic Church concerning its ritual and practice, but differs from it slightly in its theological position.

Acarians.—An Arian sect which occupied a theological position half way between the Semi-Arian and the extreme Arian, or Anomean sects. Extinct.

Adamites.—Several attempts have been made to revive the sect of Adamites, which was first suppressed in the 2d century. Its pretensions are that its members have attained the primitive purity of Adam and are, therefore, able to dispense with marriage and to go without clothing at their meetings, which are called "paradises." Upon each appearance it has been prescribed, the last attempt at rejuvenation having been in 1848-9.

Adelpians.—A branch of the Euchite sect. Extinct.

Admonitionists.—The followers of Thomas Cartwright, who, in 1572, advocated the government of churches by presbyters instead of bishops and who urged the right of the church to hold supremacy over the state. Extinct.

Advent Christian.—The largest branch of Adventists. Absolutely millennial in character, it teaches the final extinction of all evil as well as the renewal of the earth that it may become the future abode of the saints. (See ADVENTISTS.)

Aerans.—A reforming sect in the 4th century now sometimes considered to have been a forerunner of modern Presbyterianism. The members declined to permit prayers for the dead, repudiated the church fasts, and made the authority of the presbyters equal to that of the bishops. Extinct.

Age-to-Come Adventists.—One of the many sects of Adventists. Its members believe that at the time of the millennium Christ will assume a personal rather than a spiritual rule over the earth which, they hold, will not be destroyed at the Second Coming. (See ADVENTISTS.)

Agnostics.—While unorganized as a sect agnosticism teaches the theory that it is impossible for man to attain to any definite knowledge of the divine power.

Aitkenites.—A party which was founded in the Church of England about the year 1850, by Robert Aitkens, a ritualistic clergyman. It was an attempt to graft a portion of the tenets of Methodism upon the High Church school of ritualistic and sacerdotal theology.

Albaneses.—A mediæval sect closely allied to the Albigenes. Extinct.

Albigenses.—A name applied to the anti-sacerdotal sects that revolted from the Church of Rome during the 12th century. They were vigorously persecuted and finally exterminated.

Allenites.—The followers of Henry Allen, who preached the peculiar doctrine that all souls were actually present at the Garden of Eden where they participated in the fall of Adam. Extinct.

Alogians.—A name applied to a heretical sect of the 2d century because of its rejection of the doctrine of the Logos and the Gospel of Saint John.

Amalricianism.—A pantheistic heresy promulgated by Amalric of Bene, professor of logic and exegesis in the University of Paris. Extinct.

Amyraldists.—A sect of Calvinists who followed Moses Amyraut in his attempt to reconcile the disputes concerning predestination and divine grace.

Anabaptists.—A name most generally applied to those bodies of extreme anti-sacerdotalists which re-

quired re-baptism from those who had been baptized in infancy and who were often over-zealous in their repudiation of certain doctrines of the 16th century Church. For many years the term was seldom used except as one of opprobrium.

Angel Dancers.—A small sect of vegetarians founded about 1890 by Huntsman T. Mason, who claimed to be the reincarnation of the spirit of Saint John the Baptist.

Angelic Brothers.—A community of Dutch pietists founded by George Gichtel in the 16th century. Its members held that, having attained a state of angelic purity, they should give no further thought to marriage. Extinct.

Anglicans.—One definition for the High Church school in the Episcopal Church.

Annihilationists.—The name applied to those sects which teach the absolute destruction of the wicked.

Anomeans.—The extreme sect of Arians, it taught that the Son was of an essence which was not even similar to that of the Father. It existed during the 4th century.

Ansarans.—A sect whose membership is almost entirely restricted to a small district in Syria. As a religious belief it is a combination of Mohammedanism, paganism and something that somewhat resembles Christianity. This strange faith is said to have first been taught by Nusari, a prophet and saint who lived at Nasai, near Koufa, in the latter part of the 9th century, and his gospel included the doctrine of metempsychosis as well as that of divine unity in three personalities, the second and third being created. This sect now receives both the Old and New Testaments, the Koran, and several apocryphal works as its inspired scriptures.

Antiburghers.—A name applied to one of the two factions into which the Scottish Secession Church was split in 1747. The controversy was based upon the lawfulness of a clause in the oath required to be taken by burgesses, but, while the point was fiercely contended for several years, the two factions were reunited in 1820.

Anti-Mission Baptists.—A sect which is theologically in accord with the regular Baptists but that is opposed to missions, Sunday schools, and other educational and evangelistic enterprises.

Anti-pædobaptists.—A name sometimes applied to sects that are opposed to the doctrine of infant baptism.

Aphthartodocetæ.—A sect which became extinct about the 9th century. It held that the body of Christ was incorruptible even before the resurrection and that his suffering of death was merely a phantasma.

Apollinarians.—A sect condemned during the 4th century for having denied the proper humility of Christ.

Arians.—The followers of Arius, the Alexandrian priest who promulgated a widespread heresy during the 4th century. Denying the divinity of Christ and other fundamental doctrines of the Christian Church, he was condemned and Arianism was suppressed by order of the early councils. Since that time, however, the doctrines taught by Arius have been frequently revived and they still exist under other designations.

Armenians.—Although the separation of the Armenian Church from the main body of Christians, which occurred at the time of the Council of Chalcedon (451 A.D.), was the result of a comparatively inconsequential misunderstanding, it has been maintained to this day, in spite of the several attempts at reconciliation.

Arminians.—A name sometimes applied to the anti-Calvinistic sects of Protestants which teach the doctrine of universal salvation.

Artotyrites.—A sect existing in the early days of the Church. It admitted women both to the priesthood and the episcopate and taught the use of bread and cheese in the eucharist on the ground that it was right that man's oblations should be of the fruits of the earth and of the flocks.

Atheists.—The term applied to those persons who deny the existence of God.

Baanites.—A Paulician sect of the 8th and 9th centuries. Extinct.

Babists.—The followers of Mirza Ali Muhammad of Shiraz, who founded a new religious system in Persia during 1844. Described as a "Pantheistic offshoot from Mohammedanism, tintured with Gnostic, Jewish, and Buddhist ideas," the high form of morality which it teaches has appealed so strongly to the Western mind that its converts in America alone during the past few years undoubtedly number several thousand. Among other doctrines Babism teaches the equality of the sexes.

Baptists.—Those sects which oppose infant baptism, administering the rite only to adult persons, and then baptizing them not to make them children of God, but as a sign that they themselves have accepted Him. (See BAPTISTS, and BAPTISTS IN AMERICA.)

Beguni.—A fanatical Russian sect which preaches

RELIGIOUS SECTS

and, it is feared, sometimes practises the rite of human sacrifice as a means of justification before God.

Bezopofschins.—Many sects of Russian dissenters depend upon an independent ministry, rejecting the office of priest, or "pope." They are designated as Bezopofschins.

Bible Christians.—See BRYANITES below.

Bohemian Brethren.—A Hussite sect which was quite numerous in Bohemia but which ceased to exist at the end of the 17th century.

Booldo.—The Buddhism of Korea, which differs but slightly from that of China.

Borrelists.—A sect of Mennonites whose worship is devoid of all external ordinances.

Bourignonists.—A sect of Quietists founded by Antoine Bourignon, a pietist who claimed to be the subject of divine inspiration, in the 17th century. Extinct.

Brahmanism, or Hinduism.—This religion, which is the oldest faith that has sprung from the Aryan family, derives its name from that of its chief caste, from which alone, the priests are selected.

Brahmo-Somaj.—A monotheistic Hindu sect which apparently owes its origin to the contact of Brahmanism with the various anti-sacerdotal forms of Christianity represented by the missionaries.

Broad Churchmen.—A designation often applied to a school of thought in the Protestant Episcopal Church, the members of which are inclined to give considerable latitude to individual opinion in the rejection or acceptance of beliefs.

Bryanites.—Otherwise known as "Bible Christians." A sect which is in general theological accord with Methodism, but which permits women to preach.

Buchanites.—The followers of Elspeth Buchan, or Simpson, a religious enthusiast in Scotland who claimed to be the woman of Revelation in whom the light of God was restored to men. Extinct.

Buddhism.—The reform movement which originated in India, some 2,500 years ago. It was a protest against the religious and social despotism of Brahmanism, and, while atheistic in theory, teaching that release from existence, or absorption into the infinite, is the great good to which man should look forward, it has exercised an elevating effect upon the social and moral conditions of the countries where it has been accepted. It is still the religious faith of about one third of the human race.

Cainites.—A fanatical Gnostic sect of the 2d century. Its members revered such personages as Cain, Esau, and Judas Iscariot. Extinct.

Calendar Brethren.—A religious society, which, while once prominent, now exists only in Brunswick. It derives its name from the fact that its meetings are always held on the Kalends, or the first day of the month.

Calvinists.—A designation applied to those Christians, in various sects, who follow John Calvin in his opinions regarding the ministry, the sacraments, and divine grace, as exploited in his doctrines of "Election" and "Particular Redemption."

Campbellites.—The followers of Rev. John McLeod Campbell, who taught the universality of the atonement and who held that Christ's death was in no sense a vicarious satisfaction of divine justice. He was condemned as a heretic by the Presbytery of Dumbarton in 1830.

Campbellites, American.—Otherwise known as Disciples of Christ, or as Reformed Baptists. A Baptist sect founded by Rev. Thomas Campbell. Congregational in discipline it insists upon baptism by immersion as the requirement for admission to its membership. (See CHRIST, DISCIPLES OF.)

Catholic Apostolic Church.—See IRVINGITES.

Christadelphians.—Otherwise known as Christ's Brethren. A sect of modern origin which has assumed its name to distinguish it from other bodies of Christians whom it regards as apostates. Quite similar to Unitarianism in its doctrines it still insists upon baptism by immersion. (See CHRISTADELPHIANS.)

Christian Catholic Church.—(See DOWIE.)

Christian Connection.—A sect which accepts no earthly leaders and which denies the inspiration of all creeds. Its members are permitted to be guided entirely by individual interpretation of the Holy Bible.

Christian Israelites.—A small sect, the members of which are anticipating the immediate second-coming of Christ.

Christian Scientists.—The followers of Mrs. Mary Baker Eddy, who, about 1866, promulgated a system of theosophic and therapeutic doctrine. Mrs. Eddy, in her book, "Science and Health," based her theories upon the Bible, teaching that as man's essential nature is spiritual and the Spirit of God, Love and Good, any moral and physical evil must be contrary to that Spirit, representing the absence of the True Spirit which was in Jesus Christ. (See CHRISTIAN SCIENCE.)

Christian Union.—A denomination recently organized at Columbus, Ohio. Its members hope to reunite all Christian bodies on the basis of the Bible.

Christians.—Several small sects have from time to time assumed the title "Christians," to indicate that they alone are possessed of true Christianity.

Christ's Brethren.—(See CHRISTADELPHIANS.)

Christ's Sacram.—A religious society founded in the 18th century to work for the reunion of all Christian bodies. Practically extinct.

Church of God.—Otherwise known as Winebrennarians. A small body of Baptist Christians, which accepts no authority, or creed, except that contained in the doctrines exploited by its founder, John Winebrennan. (See CHURCH OF GOD.)

Church of God in Jesus Christ.—(See ADVENTISTS.)

Church of the New Jerusalem.—(See SWEDENBORGIANS.)

Coglers.—A sect of total abstainers whose chief tenet is that its members are morally incapable of committing any sin.

Collegiants.—A sect which, founded in the 17th century, is still well represented in The Netherlands and in some parts of Germany, deriving its name from the fact that its assemblies are known as colleges. Its theological position is practically that of the Quakers, plus baptism by immersion.

Collegiate Church.—The corporate name of a branch of the Reformed (Dutch) Church which occupies an important position among the religious bodies of New York.

Confucianism.—Although one of the popular religions of China, Confucianism is in no sense a religious system, its only worship being what may be defined as a religious veneration of ancestors. Instead of doctrines it presents instructions as to the proper mode of life, the discrimination between virtue and vice; the duty of compliance with the law of following the dictates of the conscience, etc.

Congregationalists.—An evangelical sect which derives its name from its fundamental principle in discipline, that each particular congregation is an independent body, having the right to elect or depose its pastors, settle all disputes regarding matters of faith, and exercise necessary discipline over its members without the interference of other congregations.

Copts.—The name applied to the Jacobite Church in Egypt, which has now almost entirely supplanted the Orthodox Church.

Cumberland Presbyterians.—A sect which withdrew from the Presbyterian Church in 1810 because of the refusal of that body to recognize as ministers persons who had been admitted without the usual educational preparation and who refused to subscribe to the Calvinistic doctrine of "Election." (See PRESBYTERIAN CHURCH.)

Deists.—Those who believe in the existence of God, but who accept few if any other of the doctrines of the Christian religion.

Devil Worshipers.—(See SATANISTS and YEZEEDEES.)

Donatists.—An early Christian sect in Africa. Its members held that they alone constituted the true church and that any offices performed by other clergy were invalid. Extinct.

Dowieites.—Otherwise known as "The Christian Catholic Church." A sect primitive in creed, the members of which believe in the healing of disease by prayer. It was founded about 1892 by John Alexander Dowie, the present General Overseer, who professes to be the reincarnation of the Prophet Elijah.

Druses.—A fanatical sect found chiefly in the mountainous regions of Syria. Their name is derived from that of their first apostle, Ismail Darazi, or Durzi. Little is known concerning their belief, their reputation for fanaticism being based upon the blood feud which they have long maintained against their Maronite neighbors.

Dukhobortzi.—A Russian sect which originated in the early part of the 18th century. It has been subjected to repeated persecutions both because of its religious doctrines and for the refusal of its members to abide by the laws of the country.

Dunkards.—Otherwise known as Brethren. An American sect of extremely primitive Baptists which was founded by a party of German emigrants in the 18th century. In addition to a dress which is peculiar to themselves, its members maintain such customs as the washing of feet and the anointing of the sick with oil. (See DUNKARDS.)

Ebionites.—A sect of Judaizing Christians which became extinct about the 4th century. They recognized Christ as the Messiah, but denied his divinity and repudiated the writings of the apostles, accepting the Mosaic law.

Elcesaites.—A Jewish Christian sect very similar in doctrine and practice to the Ebionites. Extinct.

RELIGIOUS SECTS

Encratites.—The name applied to those members of the early Church who refrained from marriage as well as the use of wine and flesh meat. Extinct.

Enochites.—A millenarian sect in Russia. It teaches that the Prophet Enoch has already returned to earth and that his personal manifestation will be the signal for the destruction of all matter.

Ensarians.—See ANSARIANS.

Erastians.—The followers of Thomas Erastus, who proposed several restrictions regarding the jurisdiction of the Church. Extinct.

Euchites.—A 4th century sect sometimes known as Euthusiasts. Its members lived a life of prayer and asceticism and repudiated the sacraments and moral law. Extinct.

Eunomians.—A sect of extreme Arians. Extinct.

Eusebians.—The followers of Eusebius of Nicomedia, who effected the restoration of Arius in 334. Extinct.

Eustathians.—The orthodox sect in Antioch during the 4th century. Extinct.

Eutychians.—The members of a sect condemned for heresy in the 5th century. They taught that Christ was possessed only of a divine nature. Extinct.

Evangelical Adventists.—The original sects of Adventism. Its particular belief is in the conscious state of the dead and, necessarily, the conscious suffering of the wicked. Like other Advent sects it is millenarian. (See ADVENTISTS.)

Evangelical Association.—A sect whose belief is like that of the Methodists except that it rejects the doctrine of original sin. (See EVANGELICAL ASSOCIATION.)

Evangelicals.—A designation sometimes applied to the Low Church party in the Episcopal Church.

Fetichism.—The lowest grade of idolatry, taking the form of a worship of some material object to which a supernatural power is ascribed.

Fire Worshipers.—A designation by which the Parsees are sometimes known.

Flagellants.—The victims of a hysterical mania which spread over almost every portion of Europe during the Middle Ages. Its devotees held that in flagellation was the only means to salvation, but their use of the scourge was finally suppressed by the ecclesiastical powers.

Flemings.—Otherwise known as "Fine," or rigid Mennonites, because they profess to maintain more ancient rites and stricter principles than those followed by ordinary Mennonites. Among these ancient rites is that of feet washing.

Foism.—The official name for the Buddhism of China. Its worship includes that of many gods which are peculiar to itself.

Fratricelli.—A sect which had its origin in a reformation of the Franciscan order in the 13th century. Its members devoted themselves to prayer, rejected the sacraments, and held that the ideal Christian condition was one of poverty. Extinct.

Free Church of England.—A name which has been assumed at various times by sects which have seceded from the Church of England. They have had no affiliation, however, either in principles of practice.

Free Kirk of Scotland.—A name assumed by that body of Presbyterians which seceded from the Established Church of Scotland in 1843. The only points in which it differs from the older body are in matters of patronage and the question of the right of the state to interfere in church affairs.

Free Will Baptists.—A sect which withdrew from the Baptist communion in 1780, chiefly because of its rejection of the Calvinistic doctrine of election.

Friends of Light.—A sect of Rationalistic Lutherans. It taught that complete intellectual freedom in religious belief could not be obtained except when individual judgment was permitted to be the sole guide of the conscience.

Friends, Society of.—(See QUAKERS.)

Galenists.—A Mennonite sect founded in 1664 as the Arminian branch of the Waterlands.

Glassites.—(See SANDERMANIANS.)

Gnostics.—The name applied to the Rationalistic sects which flourished between the 2d and the 6th centuries. They rejected the literal translation of the Scriptures, held that God was unknowable, that Christ was a superior zœon who had come to subdue the zœon of this world, and insisted that knowledge instead of faith was necessary to salvation. Extinct.

Greek Orthodox Church.—The name applied to the communion which since its separation from Rome, has acknowledged the primacy of the Patriarch of Constantinople.

Gymnosophists.—An ascetical sect of Hindu philosophers who lived as hermits that they might better devote themselves to silent contemplation. Extinct.

Hanafites.—The oldest of the four orthodox sects of Sunnite Mohammedans.

Harmony Society.—A communistic religious body composed of members of the German Pietist sect, the Separatists, which emigrated to the United States in 1803 and founded a colony in Pennsylvania, the model for which was the primitive church. After removing to Indiana in 1815, they returned to Pennsylvania in 1825, when they founded the township of Economy and the new village of Harmony. Communistic in character, they hold all property in common, discourage matrimony, and look for the early second-coming of Christ.

Hattemists.—A sect founded in The Netherlands in the 17th century. Its members denied the expiatory sacrifice of Christ and held that sin can exist only in the imagination. Extinct.

Henricians.—A sect of religious reformers that originated in Switzerland during the 12th century. Extinct.

Heracleonites.—A Gnostic sect of the 2d century. Extinct.

Hicksites.—Those who followed Elias Hicks in his separation from the main body of the Society of Friends in 1827. They deny the divinity of Christ and repudiate the doctrines of the Atonement and the Trinity.

High Churchmen.—Otherwise known as Ritualists. A designation applied to those members of the Episcopal Church who exalt the authority of the Church and give prominence to the sacerdotal aspect of the priestly office.

Hinduism.—The name applied to the modern religious beliefs which have developed from Brahmanism.

Holy Ghost and Us, Society of the.—Otherwise known as "The Church of the Living God." A sect which, millennial in character, teaches the cure of disease by faith and professes to follow a literal interpretation of the Scriptures.

Holy Rollers.—A designation applied to a small sect because of the peculiar habits of its members who roll upon the ground during their religious ecstasies.

House of Israel.—An obscure sect of American millenarians.

Huntingdonians.—A sect of Calvinistic Methodists, congregational in policy, which was founded by Selina, Countess of Huntingdon, after her withdrawal from the Wesleyan communion.

Huntingtonians.—A sect founded by William Huntington, known as the "preaching coal-heaver," who laid great stress upon the doctrines of faith and indefectible grace. Practically extinct.

Hutchinsonians, English.—The followers of John Hutchinson, who, accepting the Bible as the source of all science and all philosophy, opposed the system of Newton and all other scientific theories that could not easily be reconciled with their belief. Extinct.

Hutchinsonians, American.—The followers of Mrs. Anne Hutchinson, who taught the Antinomian doctrines in the Massachusetts Colony soon after its foundation. Extinct.

Independent Methodists.—A title assumed by several independent congregations of Calvinistic Methodists.

Inghamites.—A religious denomination founded in England in the 18th century by Benjamin Ingham, who taught a peculiar combination of Methodism and Moravianism. Extinct.

Irvingites.—Otherwise known as "The Catholic and Apostolic Church." A sect founded in 1831, its doctrines being based upon the teachings of Edward Irving, who held that by a new "outpouring" of God through the Holy Ghost the prophetic and apostolic offices had been re-established. Its ritual is very elaborate.

Jacobites.—A sect of Christians in Asia, the members of which have remained true to the Monophysite doctrines. Its churches include three patriarchates, those of Antioch, Armenia, and Alexandria.

Jains.—A non-conformist Hindu sect, the members of which believe that every object in the world, including plants and minerals, as well as men and animals, possesses souls.

Jansenists.—A school of thought established in the Roman Catholic Church by Cornelius Jansen during the 17th century. It has frequently been the subject of the condemnation of the ecclesiastical authorities.

Jerkers.—A name, usually a term of opprobrium applied to those sects whose members are in the habit of indulging in violent exhibitions of religious fervor on the occasion of revivals or other special meetings.

Joachimites.—A mystical sect which existed until some time in the 13th century. Its members believed that the earth was passing through the third and last period of its existence and that a new gospel would soon appear to supersede the Old and New Testaments.

Julianists.—A sect in the 6th century. It held that the body of Christ was incorruptible. Extinct.

Jumpers.—A name which was first applied to the Methodists of Wales because of their peculiar actions during times of religious frenzy.

RELIGIOUS SECTS

Kabbalists.—Those who are devoted to the Kabbala, or the theosophical or mystical philosophy of the Hebrew faith.

Kabirpanthis.—The followers of Kabir, a Hindu reformer, who denounced idol worship and preached that the only religion was devotion to one god, irrespective of the name by which that god might be known.

Karaites.—Otherwise known as "The Karim," or "Scripturists." A Jewish sect which adheres strictly to the Scriptures, rejecting the authority of the Kabbala as well as the Talmuds.

Kilhamites.—A name often applied to the followers of Alexander Kilham, the founder of the "New Connection of Wesleyan Methodists."

Labadists.—A sect of Christian communists which existed until the middle of the 18th century. Its members upheld the doctrines of Jean de Labadie, who taught that as life was a perpetual sabbath, the observance of a particular day was unnecessary and that marriage as a holy ordinance was not valid unless both parties to it were believers, in which case the children of such unions were born without the taint of original sin.

Lamaism.—The Buddhism of Tibet, which teaches that the soul of Buddha is always present, reincarnate in the body of the Grand Lama.

Latter Day Saints.—(See MORMONS.)

Leonists.—Same as Waldenses.

Lesghians.—A Mohammedan sect living in the Caucasus.

Life and Advent Union.—A sect which is similar to regular Adventism except that it holds that the souls of the wicked are exterminated and will not be present with the saints at the day of resurrection. (See ADVENTISTS.)

Lollards.—Otherwise known as "Bible men." The followers of Wyclif in England during the 14th century. Extinct.

Low Churchmen.—The designation applied to that branch of the Episcopal Church, the members of which strive to avoid anything savoring of sacerdotalism and whose chief regard for the ministry and the sacraments is based upon their relation to the religious life of mankind.

Lucianists.—The members of a Marcionite sect which existed during the 2d century. They held that while some representation of the soul and body would appear at the resurrection, the actual soul and body would not participate in that event. Extinct.

Lutherans.—Although there have been many changes in the various branches of the Lutheran Church since the days of Luther are the basis for the beliefs of all the sects which bear his name and which are now represented in almost every part of the Old and New Worlds. The title is also applied to all followers of that 16th century reform movement which cost the Roman Catholic Church so large a part of the Teutonic and Scandinavian constituency. (See LUTHERAN CHURCH IN AMERICA.)

Macarians.—A monothelitic sect founded by Macarius, patriarch of Antioch, in the 7th century. Extinct.

Macedonians.—A sect founded by Macedonius, bishop of Constantinople, in the 4th century. Its members denied the Godhead or distinct existence of the Holy Spirit, claiming that the supposed third person in the Trinity was no more than a divine energy which God had diffused through the universe. Extinct.

Malakanes.—A millenarian sect in Russia, the members of which reject all sacraments.

Mandaeans.—An Eastern sect that has never extended beyond Persia and Arabia. Its members are known as "Disciples of Saint John the Baptist," and, from the Christian point of view, their Christology is of a most heretical character.

Marcellians.—Followers of Marcellus, bishop of Ancyra, in the 4th century. They held that the Holy Spirit was merely an impersonal agency of God. Extinct.

Marcellinists.—A Gnostic sect of the 2d century. Extinct.

Marcionites.—An ascetic Gnostic sect of the 2d century. Its members rejected the Old Testament and denied both the incarnation and the resurrection. Extinct.

Maronites.—The ecclesiastical name for a Syrian tribe inhabiting the slopes of Lebanon. In the early days the Maronites followed the monothelite heresy, but, in 1445, they were reunited to the Roman communion, although they have continued to retain their own liturgical customs, just as they elect their own patriarch.

Martinists.—A school of religionists, or kind of pietist freemasonry, instituted by Chevalier Saint Martin. Among other peculiar doctrines the founder taught that man is antecedent to nature, having existed in

spirit, of the same essence as God Himself, prior to his existence in body.

Massilians.—The members of a Semi-Pelagian school once numerous in France.

Materialists.—Those who hold that matter is the first and only principle and that mind is the derived result.

Melchites.—The name by which the orthodox Egyptians are distinguished from the Jacobites.

Meletians.—A 4th century sect, followers of Meletius, a schismatic Egyptian bishop. Extinct.

Men, The.—The name applied to a class of lay preachers who frequent the Scottish Highlands. They wear a distinctive dress and are in direct opposition to the Kirk in all their ministrations.

Mennonites.—A general designation for those sects which were known as Anabaptists until the time of their reformation by Menno, in the 16th century. (See MENNONITES.)

Methodists.—A general designation for those sects which are more or less the outcome of the institution of John Wesley's confraternity, in 1739. The parent sect was known as Wesleyan Methodists, but many other important branches have been organized since that time, including the Methodist Episcopal Church, Methodist Reformed Church, Methodist Protestant Church, Union American Methodist Episcopal Church, Methodist Episcopal Church South, Congregational Methodist Church, New Congregational Church, Primitive Methodist Church, Free Methodist Church, Independent Methodist Church, Methodist Connection, and various African and Zion Methodist branches, which are composed of colored persons. (See METHODISM IN AMERICA.)

Michaelhahnites.—A pietist and millenarian sect organized by Michael Hahn after his separation from the Evangelical Lutheran Church of Wurtemberg. Extinct.

Millenarians.—A general designation for those Christians who anticipate the early second-coming of Christ. There are many bodies of millenarians, all professing different doctrines, the more extreme asserting that the dead will finally be restored to life, including all its bodily pleasures, on earth.

Mohammedans.—The followers of the Prophet Mohammed, who began to propagate his faith in Arabia in 611. The name which was given to this religion by its founder was "Islam," one meaning of which is "to submit wholly to God and to acknowledge Him only as Lord." The entire Mohammedan faith may be briefly explained by reference to two articles: (1) "There is no God but God," and (2) "Mohammed is His Prophet," a proposition the acceptance of which makes every doctrine of divine authority.

Molinists.—There have been two sects which have borne the name of Molinists: (1) Those who agreed with Luis Molina regarding the doctrines of free will and predestination, and (2) the followers of Miguel Molinos, the Spanish mystic who taught the doctrine of the direct relationship between the soul and God. The latter were also known as Quietists. Both are extinct.

Monarchians.—A designation applied to those who deny the distinction of persons in the Trinity.

Montanists.—A 2d century sect, the followers of which believed in the divine and prophetic inspiration of Montanus of Phrygia. Extinct.

Moravians.—Otherwise known as Moravian Brethren. A sect which occupies a theological position which is almost identically that of the Evangelical Lutheran Church. Formerly affiliated with the Taborites, it withdrew from that communion during the 15th century.

Moreltschiki.—A fanatical Russian sect whose practices are said to be in keeping with its name, which means "self-immolators."

Mormons.—Otherwise known as Latter Day Saints. A religious system organized by Joseph Smith, who claimed to have found his inspiration in a "Book of Mormon," which he had unearthed and translated. The doctrines have been further extended by later revelations, one of which, the "Celestial Law of Marriage," which was promulgated in 1852, and which authorized the practice of polygamy, having resulted in a reform movement which brought about the secession of a large body of Mormons who assumed the name of the "Reorganized Church of Jesus Christ of Latter Day Saints." (See MORMONS.)

Muggletonians.—An English sect founded in 1651 by Lodowick Muggleton and John Reeve, who claimed to be the two witnesses referred to in Revelations. They insisted that they were divinely inspired and taught many doctrines peculiar to themselves. Extinct.

Mystics.—The general designation applied to those who believe that a rapt soul may enter into union with the divine by means of ecstatic contemplation.

Naumbergers.—An obscure evangelical sect which carries the simplicity of its dress to such extreme as to use hooks and eyes instead of buttons.

RELIGIOUS SECTS

Nazarenes.—A 4th century sect of Jewish Christians. While observing the Mosaic ritual they accepted the divinity of Christ and looked for his early second-coming.

Necessitarians.—A general designation applied to those who believe that a fixed and unchangeable law governs everything.

Nestorians.—The followers of Nestorius, who denied the hypostatic union of the two natures in the one person, Christ. Two sects of Nestorians, the remnants of the once-powerful denomination, still exist, one in Turkey and Persia, and the other in India.

Netortschins.—A sect of Russian dissenters who believe that antichrist has commenced the ruin of the Church and that all holiness is gradually being extinguished.

New Jerusalem Church.—(See SWEDENBORGIANISM.)

New Lights.—A designation sometimes applied to the Free Will Baptists and Separatists.

Niobites.—A monophysite sect which was finally absorbed into the orthodox communion. Its members held that the human nature of Christ was lost in its union with his divine nature.

Non-conformists.—A designation sometimes applied to various sects of Protestant dissenters.

Noctians.—The followers of Noctus, a 2d century heretic, who held that Christ was the actual embodiment of the Father and that it was the Father Himself who was born and had suffered death on the cross.

Novations.—An austere 3d century sect which was absorbed by the mother church before the 6th century, its differences having been chiefly in regard to matters of church discipline.

Oahspe.—A sect of American vegetarians, extremely primitive in character. Its tenets prohibit divorce and second marriage and its members are not permitted to have recourse to law.

Old Catholic.—A movement inaugurated in Germany as a protest against certain dogmas of the Roman Catholic Church.

Old Lutherans.—The name applied to those Lutherans of Prussia who have refused to enter into affiliation with the United Evangelical Church.

Old School Baptists.—The name assumed by a religious sect which still maintains the strict doctrines of Calvinism.

Old Two-Seed-in-the-Spirit Predestinarians.—A strictly Calvinistic sect of American Baptists.

Omish Church.—The name applied to a strict sect of primitive Mennonites.

Ophites.—A Gnostic sect which held that the serpent that tempted Eve was the impersonation of divine wisdom.

Osiandrians.—The followers of Osiander, a 16th century theologian who taught that the attainment of the essential righteousness of Christ was necessary to justification by faith.

Pantheists.—The members of a philosophical school which teaches that God is in everything and that everything is God.

Parsees, or Parsis.—The followers of Zoroaster, who founded the ancient religion of Media and Persia, about 1000 B.C.

Paulicians.—A sect founded in the 7th century, the members of which held that all matter is evil and that Christ had a purely ethereal body and suffered only in appearance. Extinct.

Peculiar People.—A sect which in almost every respect resembles the Dunkards.

Pelagians.—A sect which held that there was no original sin, but that each soul was created sinless and free. Extinct.

Peremayanofschins.—A sect of Russian dissenters which requires the re-ordination of the clergy.

Perfectibilists.—A name applied to those who hold that absolute perfection is attainable during the present life.

Perfectionists.—The name assumed by an American sect established by John Humphrey Noyes, in 1845. In addition to teaching perfect holiness through complete reconciliation with God, its founder maintained the equality of the sexes and the community of goods.

Picards.—A sect suppressed in the 15th century because of alleged immoralities. They held that salvation was obtainable only through the restoration of man's primitive innocence.

Pietists.—A general designation applied to those who claim to be possessed of extreme piety.

Plymouth Brethren.—A sect which holds the two doctrines of Predestinarianism and Millenarianism and which does not maintain a separate ministry.

Pomorane.—A sect of Russian dissenters which has no separate ministry and which requires re-baptism of converts.

Popofschins.—That branch of Russian dissenters which continues to maintain the office of priest, or "pope."

Positivism.—A modern school of skepticism, founded by Auguste Comte. As a religion Positivism is nothing less than the worship of humanity; as a philosophy, it teaches that nothing should be accepted as true unless it can be positively demonstrated.

Predestinarians.—A general designation applied to those who believe that each soul is predestined for heaven or hell from all eternity.

Presbyterians.—The name assumed by a denomination which maintains that the ministry of the Church should consist of but one order, that of presbyters, or elders. Its creed, which has been Calvinistic since the establishment of the denomination, is now, in some places, in process of alteration.

Princeites.—A small English sect established in 1840 by Henry James Prince, who professed that his person represented a new dispensation of the Holy Ghost by which the dispensation of Christ was to be superseded. It is now practically extinct.

Protestant Episcopal Church.—The American representative of the Church of England, the denomination which led in the protesting reformation of the Roman Catholic Church in that country. In addition to its creeds it adopts the principles of the Thirty-nine Articles and makes use of the Book of Common Prayer. (See PROTESTANT EPISCOPAL CHURCH.)

Puseyites.—The name sometimes applied to the High Church school in the Episcopal Church, from that of Dr. Pusey, who was one of the leaders in the "Tractarian" or ritualistic movement.

Pyrrhonists.—The designation applied to that school of extreme skepticism which denies the possibility of attaining with certainty any absolute truth.

Quakers.—Otherwise known as Friends, or as the Society of Friends. A sect founded by George Fox. Its members reject all sacraments, possess a mixed but not settled ministry which depends upon the inspiration of the Holy Spirit for its utterances, and refuse to participate in wars or to take oaths. They also maintain a peculiarity of dress and a simplicity of speech which is quite in keeping with their life of peace and meditation. (See FRIENDS, SOCIETY OF.)

Quietists.—A designation often applied to a school of mysticism, the followers of which profess to resign themselves passively to what they regard as divine manifestations. The name is also applied to certain distinctive sects like the Bourignonists and Molinists.

Rappists.—(See HARMONY SOCIETY.)

Rationalists.—Those who maintain that reason is the one test of truth in matters of religious faith and who are guided by this theory in their interpretations of the Bible.

Reformed Dutch Church.—The Reformed Protestant Dutch Church which was instituted in the Netherlands during the 16th century. In 1501 it adopted a confession of faith, known as the Belgic confession, which was prepared by Guido de Bres, who took for his model the Calvinistic confession of the Church of France. This body was the first Reformed Church instituted in the American colonies.

Reformed Dutch Church, True.—A sect resulting from the secession of a party led by Rev. Sol Froeligh, in 1822. They held that the Reformed Dutch Church had become erroneous in doctrine, lax in discipline and corrupt in practice. During recent years the sect has gradually dwindled away although it is still in existence.

Reformed Episcopal Church.—Founded in 1873 as a church of the reformation, or, as a protest against what it termed the errors in the position and practice of the Protestant Episcopal Church.

Reformed German Church.—That portion of the Protestant church which, being unable to embrace either the teaching of Luther or of Zwingli endorsed instead the Melancthonian compromise.

Reformed Presbyterian Church.—Otherwise known as Cameronians. A sect founded in the 17th century as a protest against what its members regarded as the "unworthy compromise" of the Established Church.

Remonstrants.—A title applied to the Arminians for the reason that they had called their creed, adopted in 1610, "The Remonstrance."

Relief Synod.—A body of Scotch dissenters whose secession was the result of their opposition to the existing system of patronage.

Restorationists.—A small sect the beliefs of which may be designated as Universalism in a modified form.

Ritualists.—Another designation for High Churchmen.

Roman Catholic Church.—That body of Christians who look to the Holy See for direction in spiritual things. (See ROMAN CATHOLIC CHURCH.)

Russian Orthodox Church.—The national Church of Russia. It differs in belief but slightly from that of the Roman Catholic Church, from which it separated about 1,000 years ago.

Ruthenians.—The members of the Ruthenian Church

RELIGIOUS SECTS

are converts and the descendants of converts from the Russian Church who now maintain obedience to the Pope in spite of the fact that they have never altered their ancient rites and discipline and still use the Greek liturgy, which they have translated into Old Slavonic.

Sabbatarians.—Those who insist upon the strict observance of the Sabbath as a tenet binding upon all Christians.

Sabbatians.—A 4th century sect the members of which adopted the Quartodeciman rule. Extinct.

Salvation Army.—A quasi-military organization formed to promote the revival of religion among the masses. It was organized in England, about 1865, by William Booth, a Methodist evangelist. At that time it was known as the Christian Mission, and it retained the title until 1878, when it was changed to that of the Salvation Army. Its theological position is thoroughly evangelical.

Samokrischtchins.—A name which signifies "self-baptizers," and which as applied to a sect of Russian Christians, indicates its theological peculiarity.

Sandemanians.—A denomination founded in the 17th century by Robert Sandeman, a disciple of John Glas. Its members maintain a community of goods; abstain from blood meats and from things strangled, and participate in love feasts and a weekly communion.

Satanists.—The members of a strange sect which worships and prays to Satan not only because of his present power to do evil, but on account of his future power to do good.

Schwenckfeldians.—A sect of German anti-sacramentalists founded at the time of the Reformation by Casper Schwenckfeld.

Scottish Baptists.—A sect which differs from other Baptists only by being more Congregational in government and having a somewhat stricter form in discipline.

Scottish Kirk.—The Established Presbyterian Church of Scotland, which, founded on the ruins of the ancient Scottish Church, in the 16th century was adopted as the National Establishment by act of Parliament.

Second Adventists.—(See ADVENTISM and MILLENNARIANISM.)

Secularists.—The term Secularist is most generally applied to the members of that school of skepticism which holds that man should devote his attention only to the duties and interests of this world.

Seleucians.—Followers of Seleucus, who rejected baptism by water and who taught that there would be no resurrection of the body. Extinct.

Seventh-day Adventists.—The most primitive form of Adventism, its members practising many of the ancient Christian rites. (See ADVENTISM.)

Seventh-Day Baptists.—A sect which differs from other Baptists chiefly in the observance of Saturday, or the seventh day of the week, as its day for rest and worship.

Shafities.—A Mohammedan sect, one of the four branches into which the orthodox sect of Sunnites has been divided.

Shakers.—A sect of American millenarians founded in 1776 by Ann Lee. Although it does not impose celibacy as a necessary rule of life, married couples are not permitted to live together in its communities.

Shaktas.—A Hindu sect, the members of which worship the divine power under its female representation.

Shiaha.—A Mohammedan sect which claims to be the one orthodox branch of the religion because they accept Ali, the first cousin of Mohammed, as the successor to the prophet, rejecting the other caliphs who are accepted by the Sunnites.

Shiites.—One of the two great divisions of Mohammedanism. Its doctrines are directly contrary to those of the orthodox sect, the Sunnites.

Shintoism.—The state religion of Japan. It teaches the existence of both good and evil gods.

Sikhs.—A sect founded in India, about 1500, upon principles of monotheism and human brotherhood.

Six-Principle Baptists.—The oldest sect of American Baptists. Its doctrines are founded upon the "six principles" mentioned in the first three verses of the sixth chapter of the Epistle to the Hebrews: (1) Repentance from dead works; (2) faith toward God; (3) baptism; (4) laying on of hands; (5) resurrection of the dead, and (6) eternal judgment.

Skeptici.—A fanatical sect of Russians. Its members practise severe penances, including, it is said, self-mutilation.

Smarias.—One of the three great divisions of the Hindu religion.

Society of Friends.—(See FRIENDS, SOCIETY OF.)

Socinians.—The followers of Socinius, who denied the divinity of Christ and the atonement, who rejected the sacraments and the authority of the Scriptures, and who held that the soul of man was born pure.

Southcottians.—The followers of Joanna Southcott,

who professed to be the inspired woman of Revelation, who was predestined to give birth to the new Messiah. Although she died of dropsy ten days after the date on which, as she had predicted, this event was to occur, her disciples maintained their faith in her supernatural gifts, and the sect still exists in small numbers in England.

Spiritualism.—A religious body composed of those who believe that it is possible for man to hold communication with the spirits of the departed.

Staroverzi.—A designation applied to those who refused to participate in the ecclesiastical reforms introduced in the Russian Church in the 17th century. The name signifies the "men of the ancient faith."

Sunnites.—The name applied to the orthodox Mohammedans who constitute the largest sect of the Moslem world. Its members accept the books of Sunna, said to be the verbal utterances of Mohammed, as well as the Koran, as the sources of doctrine. (See SUNNITES.)

Swedenborgians.—Otherwise known as the Church of the New Jerusalem. A religious system promulgated by Emmanuel Swedenborg, who taught that the last judgment had taken place in the year 1757, when the "Old Church," or Christianity had given place to the new dispensation as represented by the "New Church" of Swedenborg.

Syrian Church.—A religious body still under obedience to the Pope. Its members continue to maintain the ancient Syriac rites, which are common alike to the Jacobites and themselves.

Taborites.—The members of one of the most extreme parties of Hussites.

Taoism.—The materialistic religion of China.

Theists.—Believers in a personal Creator and Divinity, however conceived as related to man. The term is used as contrasted with Deists; Deism being the belief in a divine principle, not a personality.

Theosophists.—Those mystics who affirm that they are admitted to a knowledge of the mysteries of being, on the side of nature as well as upon that of religion, by means of an internal and supernatural illumination. One of the most modern applications of the word is as a designation for the followers of Mme. Blavatsky.

Traskites.—An early name for the Sabbatarian puritans.

Tübingen School.—A name applied to a certain rationalistic school of philosophy, the members of which questioned the credibility, integrity, and reliability of the New Testament.

Ultramontanists.—From a Roman Catholic point of view this name is applied to those who believe that the Pope is supreme ruler over every part of the Christian Church and of every sovereign of earth.

Unitarian.—A name applied to those who deny the distinction of persons in the Trinity and who hold that they in themselves only hold, in its true sense, the Unity of God.

United Brethren.—Otherwise known as United Brethren in Christ. A sect whose present doctrinal position is quite similar to that of the Moravians. Although never officially instituted it grew out of the attempt of William Otterbein to found a church that would unite the various Presbyterian sects as one body of Christians.

United Presbyterians.—A body composed of two sects of Scotch dissenters, the Associated and the Relief synods.

Universalists.—Those who believe in the ultimate salvation of all mankind.

Utilitarian.—A designation applied to those who hold that man's actions derive their character, in a moral sense, from their consequences.

Vamamargis.—The name applied to those persons who, in Hinduism, worship the female side of the dual nature of Vishnu.

Volunteers of America.—An offshoot from the Salvation Army resulting from a misunderstanding between the leaders of the two bodies. As in the Salvation Army both sexes participate in its meetings, and, like the older body, while it has no formulated creed, it is thoroughly evangelical.

Wahhabees.—Followers of Abd-el-Wahhab, a Mohammedan reformer of the 18th century. They strenuously oppose all practices not absolutely sanctioned by the Koran.

Waldensians.—A reforming body of Christians, the members of which participated in the Reformation. A Waldensian church now existent in Italy numbers more than 20,000 members.

Waterlanders.—A sect of Mennonites, similar in doctrine but less rigid in discipline than the main body.

Wilburites.—A branch of the Society of Friends who followed John Wilbur in his protests against the actions of the Society in abandoning its original principles.

Wilkinsonians.—A 19th century American sect the

members of which accepted the statements of Jemima Wilkinson, who asserted that she was divinely inspired, having been raised from the dead.

Yezseedeas.—An ancient sect of unknown origin. Its members form a tribe of individual nationality located in the neighborhood of Mosul. They not only believe in God but also in Satan, whom they recognize as the chief of the angelic hosts. Admitting that he is suffering punishment now, they believe that he will eventually be restored to his originally high station. As the result, like the Satanists, they believe that it is right for man to pray to him.

Zanzalans.—A designation applied to the Jacobites of the East.

Zoarites.—The name applied to a sect of American Lutherans.

Zoharites.—A modern Jewish sect which takes its name from the Kabbalistic book of Zohar, which is held in great veneration.

Zoroastrians.—See PARSEES.

J. R. MEADER,
Editor *'American Almanac.'*

Religious Societies. See ORDERS, RELIGIOUS.

Rel'y, James, Welsh Universalist clergyman: b. Jeffreston, Pembrokeshire, Wales, about 1722; d. London, England, 25 April 1778. He was converted by George Whitefield in 1741 and became one of his preachers, but after several years became convinced of the truth of Universalism and broke with Whitefield. He settled in London in 1761 and though his preaching met with little success yet in 1770 he converted to his faith John Murray (q.v.), the founder of Universalism in United States.

Remainder is defined in law as an estate which commences after the determination of another estate in the same property, which has previously been limited by the same conveyance. A remainder becomes vested whenever the preceding estate is limited so as to determine on an event which must certainly happen. It is the present right of one to the future enjoyment of an estate, which right takes effect on the determination of the preceding estate. Contingent estates usually give rise to considerable doubt. The intention expressed in the instrument by which the contingent estate is created, governs. Contingent remainders are defined by statute in some States.

Rembang, rēm-bāng', Java, a busy town on the north coast, west of the river Rembang, and 60 miles west-northwest of Samarang. Its well-protected harbor is one of the best in the island. It has a good trade in ship-timber and in ship-building, and near it are valuable salt-pans. Pop. 11,000.

Rembrandt, rēm'brānt or -brānt (full name written REMBRANDT HARMENSZ VAN RIJN or RYN), Dutch painter and etcher: b. Leyden 15 July 1607; d. Amsterdam 8 Oct. 1669. He was the son of a miller settled in Leyden; and an early shown disposition toward the life of an artist caused him to be taken from the Latin School at an early age and put into the studio of a Leyden artist who took pupils. In 1622 he was sent to a studio in Amsterdam. In 1623 he seems to have been working as an artist and there is a signed and dated picture of 'Saint Paul in Prison' in the Stuttgart Gallery, which is his earliest piece with an ascertained date. By 1630 he was settled in Amsterdam, and in 1634 married Saskia van Ulenburgh, who lived with him only eight years, leaving one son, Titus. Saskia had property; and her death caused confusion in Rembrandt's affairs because of her will leaving all of this property to Titus, with only a life interest to her husband, while in the mean-

time Rembrandt's affairs had been in a bad condition. In 1656 he was finally sold out as a bankrupt. It is not perfectly known why the very prosperous painter who, in his early manhood, had a great deal of work to do as a portrait painter (always a profitable branch of the art), and whose etchings sold remarkably well, should have become so straitened in his circumstances. It is known that he bought very freely, surrounding himself with works of art of all kinds, of which he was a constant and diligent student, and by means of which he gave himself that knowledge of the world which he did not obtain from travel, as it appears that he never crossed the frontiers of the United Provinces. It is also asserted that a certain change in popular taste left him at one side while it followed men whom we now deem greatly his inferiors in artistic power. He had many pupils and many assistants, and even the interruptions caused by death and by loss of fortune do not seem to have checked the great production of his work, for between the time of his bankruptcy and the time of his death, 13 years later, he was as busily engaged and his work was fully as important as at any former time. The mention of a few works of art with their dates in the course of this article illustrates this fact sufficiently well.

At a very early date Rembrandt's style as a painter was fixed. It is extremely original, founded on the work of no other artist of any school, based upon a strong perception of the beauty and value of pure light and shade in nature and in art. In one sense he was a great colorist, namely in that he conceived a painting as strictly the result of a disposition and combination of the hues and tints, treating all his work with as complete a color-scheme as that used by the great Venetians. There is this peculiarity, however, that Rembrandt's coloring is sombre, and reaches its highest achievement in combinations of browns and grays with but few passages of primary color or of those hues which approximate to primary color. A blue sash may appear in a portrait, and its effect of pure, bright color may be led up to and assisted by the glimmer of steel and the warm yellowish-brown of a buff coat; but as a general thing these effects are not his happiest achievements as we see the pictures now, and those are the most delightful to us in which he departs the least from his accustomed gravity of tone. There is a certain disappearing of the subject in blackness which is very disagreeable to many lovers of painting; and it is hard to form a conception of how far this has been the result of time producing changes in the pigments. Meanwhile the effect of a brilliantly modeled head coming to light from a profoundly gloomy background and helped by the painting of costume similarly relieved by light colors upon darkness, is very pleasing to many students; and apart from his obviously surpassing ability, Rembrandt is a delightful painter to many ardent lovers of the art of painting. To painters by profession Rembrandt must always be one of the men whose work commands the highest respect.

His power of characterization is not confined to painting, and his small etchings drawn upon copper in a few straggling lines have as much of it, according to their subject, as the

largest pictures. This power of characterization lifts him almost out of the category of the painters of his period. When he has character to express, either of an individual or of a race of men, he does it with a touch and an evidence of thought entirely his own. It may sometimes take a disagreeable, even an ignominious appearance, and his drawing in a given case may not be dignified or refined or even truthful; while yet the significance of the statement he wishes to make remains uniformly distinct and positive.

Among his most important paintings are the 'Saint Paul in Prison,' in the Stuttgart Gallery, signed and dated 1627; the portrait of a man at Windsor Castle, signed and dated 1631; the portrait of his brother in the Berlin Museum, that of himself in Buckingham Palace, and that of an old woman in the Hermitage collection near Saint Petersburg; 'The Supper at Emmaus,' in the Louvre; and 'The Lesson in Anatomy,' at The Hague. There are two magnificent portrait groups, one of his middle life and one of his more advanced age; 'The Night Watch,' in the Amsterdam Museum, signed and dated 1642, and 'The Syndics of the Clothmakers' Company,' in the Amsterdam Museum, signed and dated 1661.

Of his etchings the number is so very great and the enthusiasm which they have excited among great classes of collectors and students during the 19th century is so intense, that it is very hard to name even a few characteristic specimens. The prices which they fetch at auction or at private sale are enormous (several thousands of dollars in many cases), though price is not always proportionate to merit, as rarity has much to do with this detail. Thus the famous 'Three Trees' (1643), of which a fine copy is worth as much money as a large oil painting by a modern artist, and the wonderful portrait of the 'Burgomaster Six' are not necessarily as much better than other and less costly prints as their price would indicate. Their faultless work, however, is the main consideration, and the portrait of Six must always be of extreme value when in fine condition, because the closely worked etching has caused the plate to suffer from use—there can never have been more than 40 or 50 impressions of great brilliancy. During his life and during the 18th century the so-called Hundred Guilder print, 'Christ Healing the Sick,' was the most famous; and since that time the etching, slight and but little worked over, 'The Death of the Virgin' (1639), is one of the most admired by artists of all Rembrandt's work in black and white; the wonderful portrait of the 'Goldweigher' (1639), that of the preacher, Uijtenbogaert (1635), the famous Dr. Faustus, dated 1648, and several of the landscapes, especially the 'Cottage with the Great Tree,' and the magnificent 'Omval,' dated 1645, are all etchings which are unsurpassable even among Rembrandt's own works.

The most complete book on Rembrandt, that of C. Vosmaer, 'Rembrandt, sa Vie et ses Œuvres' (1877), has furnished most writers since that time with their facts. A more recent work of great extent and thoroughness is that by Emile Michel, translated into English as 'Rembrandt, his Life, his Work, his Time' (London, 1894). This book is elaborately illus-

trated. Small biographies by Knackfuss (1899), Malcolm Bell (1899), Neumann (1900), some of them well imagined, are contained in the different series of Artists' Lives. The etchings form a continual study, and besides the famous work of Bartsch (1797), which is continually referred to, there have been works by Charles Blanc (1880) and Dutuit. His complete etched work has been reproduced in admirable photogravure by Armand-Durand. The English etcher and student of etchings, Sir Francis Seymour Haden, has published a small book on Rembrandt's etchings, 'The Etched Work of Rembrandt' (1879-80), in which there is a careful investigation of the authenticity of some which may be thought to be by students or imitators.

RUSSELL STURGIS.

Remedios, rā-mā'thē-ōs, or **San Juan de Los Remedios**, sän hoo-än' dé lōs rā-mā'thē-ōs, town, Santa Clara province, 32 miles east of the town of Santa Clara. It is four miles from the north coast, but is connected with its port, Caibarien, by rail, and also with the important towns of the island to the west. It is in a fertile region and carries on a good trade. Pop. (1899) 6,633.

Remensnyder, rēm'en-sni'dēr, **Junius Benjamin**, American Lutheran clergyman: b. Staunton, Va., 24 Feb. 1843. He was graduated from Pennsylvania College, Gettysburg, in 1861 and from its theological department in 1865. He served in the Union army in 1862-3, was ordained in 1865 and has held important pastorates at Philadelphia, Savannah, and New York, and originated the movement which resulted in the adoption of a common service ritual in all American Lutheran churches. He has published: 'Heavenward' (1874); 'Doom Eternal' (1880); 'Six Days of Creation' (1886); 'Lutheran Manual' (1892); etc.

Remenyi, rē'mān-yē, **Edouard**, Hungarian violinist: b. Heves 1830; d. San Francisco, Cal., 15 May 1898. He studied violin at Vienna under Joseph Böhm. For his part in the insurrection against Austria in 1848 he was obliged to flee from Hungary. He came to the United States in 1849, but returned to Europe a few years later and in 1854 was appointed solo violinist to Queen Victoria. He returned to Hungary in 1860 under the amnesty, and attained great fame. Thenceforward he made repeated tours in Europe and returned to the United States in 1878, where he spent much time until his death. He possessed a high technical mastery of his instrument, but was often betrayed into exaggerations that marred the artistic effects of his playing.

Remey, rā'mī, **George Collier**, American naval officer: b. Burlington, Iowa, 10 Aug. 1841. He was graduated from the United States Naval Academy in 1859 and entered the navy and served with distinction on the Union side during the Civil War. When the war with Spain broke out he was placed in command of the naval base at Key West, Fla., and subsequently became commandant of the navy yard at Portsmouth, N. H. He was promoted rear-admiral in 1898, and in 1900 was given command of the Asiatic Station at Yokohama, and in this capacity directing the operations of the United States naval forces in China. He was retired in August 1903.

From the original painting by himself.

HARMENSZ VAN RIJN REMBRANDT

Remigius, rě-mīj'ī-ūs, **Saint**, the great apostle of the French nation: b. Laon 438; d. Rheims 13 Jan. 533. He was appointed bishop of Rheims in 459. He it was who baptized Clovis, the founder of the French monarchy, who had been converted to Christianity chiefly through the influence of his queen, Clothilde. The ceremony took place amid imposing surroundings on Christmas Day, 496. Through the example of the king and the untiring exertions of Remigius almost the whole of Gaul was Christianized in the lifetime of the latter. Consult: Migne, 'Patrologia Latina,' Vol. LXV. (which contains some of the bishop's letters); Aubert, 'Vie de Saint Remi' (1849).

Remington, Frederic, American artist: b. Canton, N. Y., 4 Oct. 1861. He studied at the Yale Art School and the Art Students' League, New York, and later went west where, as cowboy and stockman on a ranch, he gathered the material that has made him a success in scenes of frontier life. He has contributed frequently to the leading magazines and periodicals scenes of western military and Indian life, and also events of the Cuban War of 1897-8. Few illustrators draw the horse with so much character and life-likeness. He has produced several sculptures such as 'The Broncho Buster' and 'The Wounded Bunkie.' As author and illustrator he has produced 'Pony Tracks' (1895); 'Crooked Trails' (1898); 'Frontier Sketches'; and a novel, 'John Ermine of the Yellowstone' (1902).

Remington, Philo, American inventor: b. Litchfield, N. Y., 31 Oct. 1816; d. Silver Springs, Fla., 5 April 1889. He entered the small-arms factory of his father at Ilion, N. Y., and for 25 years was superintendent of the mechanical department. The perfecting of the Remington breech-loading rifles and of the Remington typewriter was mainly due to him. In 1886 he withdrew into private life and in that year Wyckoff, Seamans & Benedict bought out the Remington interest in the typewriter, and an assignment having been made, took charge of the Ilion plant. In 1888 the main plant passed to Hartley & Graham, who operated it as the Remington Arms Company.

Remington Rifle. See SMALL ARMS.

Remittent Fever. See JUNGLE-FEVER; MALARIA.

Remonstrants, those members of the Reformed Church in Holland who, in the year 1609, after the death of Jacobus Arminius, continued to adhere to his doctrines, and in 1610 presented to the States of Holland a remonstrance in which they defend the grounds of their dissent from the official creeds of the Reformed Church: thereafter they were styled Remonstrants, and they are still represented in Holland by a small but scholarly and liberal sect. See ARMINIANS; RELIGIOUS SECTS.

Rem'ora, or **Sucking-fish**, a popular name for any species of the family *Echinididae* and order *Discocephali*. The top of the head is provided with a peculiar sucking disk, a modification of the spinous dorsal fin, composed of a series of plates arranged transversely, by means of which they attach themselves to moving objects and thus supplement their powers of locomotion. On the coast of Zanzibar and elsewhere they are used in catching other fishes and

turtles, the remora being secured by a line fixed to the tail, and being sent in pursuit of the turtles, etc., to which it attaches itself by means of its sucker. The ancients believed in the remora's power of arresting and detaining ships in full sail through their suction powers; and Antony's galley at the battle of Actium was said to have been fixed by a remora, which defied the efforts of several hundreds of men to free the vessel.

The remoras are a group of oceanic fishes occupying a rather isolated position among the spiny-rayed *Teleostomi*. Five genera and eight species have been recorded from North American waters. Some of them appear to confine their attentions to particular species of large fishes, as the spear-fish, dolphins, etc.; others are less particular. The common species on the Atlantic coast of the United States are the shark-sucker (*Echeneis naucrates*), very frequently found adhering to large sharks as well as to other fishes; *Remora brachyptera*, the sword-fish remora; and *Remora remora*, a species widely distributed in warm seas. They are not utilized for food nor for any other purpose in this country.

Remscheid, rēm'shīt, Prussia, Rhine province; a manufacturing centre. Its chief articles of trade are cutlery and iron wares, besides machinery, tools, silk, etc. Pop. (1900) 58,108.

Rem'sen, Ira, American chemist and educator: b. New York 10 Feb. 1846. He studied at the College of the City of New York, was graduated in 1867 from the medical department of Columbia, pursued chemical courses at Munich and Göttingen, and in 1870-2 was assistant to Professor Rudolph Fittig in the chemical laboratory of the University of Tübingen. In 1872-6 he was professor of chemistry and physics in Williams College, and in 1876, upon the organization of the Johns Hopkins University, was made professor of chemistry in the new institution. He formed its chemical department and has continued to direct the numerous researches of the Johns Hopkins laboratory, the facilities of which are not excelled in the United States. Despite the large amount of executive work devolving upon him in connection with his chair, he found opportunity for considerable original investigation, including that in connection with the oxidation of aromatic substitution products, the sulphides, double halides, and the decomposition of diazo compounds by alcohol. In 1881 he made a study for the city council of a peculiar condition of Boston water, which he found due to a growth of fresh-water sponge in one of the artificial lakes from which the supply was derived. He also conducted for the National Board of Health special researches in various subjects, among them 'Organic Matter in the Air' and 'The Contamination of Air in Rooms Heated by Hot-Air Furnaces or by Cast-Iron Stoves.' He was made vice-president of the university, and frequently, in the absence of the president, Dr. Daniel Coit Gilman (q.v.), acted as president. In June 1901 he was chosen president upon the resignation of Dr. Gilman. In 1873 he was elected to the American Association, in 1875 made fellow, and in 1879 president of the chemical section, and in 1902 president of the association. He became a member of the National Academy of Sciences in 1882, and was at one time president of the American Chemical

Society. He founded in 1879, and has since edited, the 'American Chemical Journal.' Among his text-books are: 'The Principles of Theoretical Chemistry' (1877); 'Introduction to the Study of the Compounds of Carbon, or Organic Chemistry' (1885); 'Introduction to the Study of Chemistry' (1886); 'The Elements of Chemistry' (1887); 'A Laboratory Manual' (1889); and 'Chemical Experiments' (1895).

Remus, rē'mūs, in the fabulous history of Rome, the twin brother of the founder of the city, Romulus, who in a quarrel slew him.

Remus, Uncle, a well-known negro character invented by Joel Chandler Harris (q.v.) and introduced to his readers in 'Uncle Remus: His Songs and Sayings' (1880). Uncle Remus, an aged plantation African, is used as the mouth-piece of quaint folk-lore tales current among the blacks of the South and detailing in picturesque and amusing fashion the adventures of Br'er Rabbit, Br'er Fox, and other animals. The stories, interlarded with considerable homely philosophy, were gathered with much care by the author, and awakened among students an interest in that domain of the beast-fable.

Rémusat, râ-mû-ză, Charles François Marie, COMTE DE, French politician and man of letters, son of the Comtesse de Rémusat (q.v.): b. Paris 13 March 1797; d. there 6 June 1875. He was educated at the Lycée Napoleon and entered life as a journalist and lawyer. He was a member of the Chamber of Deputies 1830-48, and in 1848-9 of the constituent and legislative assemblies, in which he voted with the friends of order. From March to October 1840 he was minister of the interior, and in 1871-3 minister of foreign affairs. He began public life as a Liberal, but ended it as a Conservative. During the Second Empire he lived in retirement, devoting himself chiefly to literary pursuits. His works include: 'L'Angleterre au XVIII. Siècle' (1856); 'Bacon' (1857); 'Lord Herbert of Cherbury' (1874); 'Histoire de la Philosophie en Angleterre depuis Bacon jusqu'à Locke' (1875); 'Abélard' (1845); 'Essais de Philosophie' (1842); etc.

Rémusat, Claire Elizabeth Jeanne Gravier de Vergennes, COMTESSE DE: b. Paris 5 Jan. 1780; d. 16 Dec. 1821. She was married to Comte Auguste Laurent de Rémusat, Napoleon's chamberlain, and her position made her thoroughly acquainted with the life of Napoleon's court. Her 'Essai sur l'Education des Femmes,' published 1824, received an academic *couronne*, and her 'Mémoires,' published in 1879-80, are particularly valuable for the light they throw on the court of the First Empire.

Rémusat, Jean Pierre Abel, French Orientalist: b. Paris 5 Sept. 1788; d. there 5 June 1832. He devoted himself to the study of Oriental languages, particularly Chinese, while pursuing a course in medicine, and in 1811 published 'Essai sur la Langue et la Littérature chinoises.' He received his degree as a physician in 1814 and entered one of the military hospitals, but in that year accepted the chair of Chinese which had been established for him at the Collège de France. He was admitted to the Academy of Inscriptions in 1816 and in 1818, after Visconti's death, became editor of the 'Journal des Savants.' He was one of the founders of the Société Asiatique in Paris. His

works include: 'Livres des Récompenses et des Peines' (1816); 'L'invariable Milieu' of Tsz-tse' (1817); 'Eléments de la Grammaire chinoise' (1822); 'Mémoire sur la Vie et les Opinions de Lao-tse' (1823); 'Recherches sur les Langues tartares' (1829); etc. Consult Silvestre de Sacy, 'Notice sur la Vie et les Ouvrages de Rémusat' (1834).

Remy, Saint. See REMIGIUS, SAINT.

Renaissance, rê-nâ-săns or rê-nâ'săns, a movement in learning, science, literature or art, or in all of them, in which it is thought that there is a revival of an ancient spirit and of ancient methods, or even a decided advance in intelligence without traceable imitation. The name is given especially to several movements in European history, all more or less abortive; but most of all to the great movement which began in Italy about 1300 A.D. This movement, called by the Italians the *Risorgimento*, consisted at first, so far as conscious effort was concerned, in the collecting of Latin manuscripts of the classical authors, and the study of them. It is noticeable, however, that this purely scholarly movement was accompanied by a general intellectual advance, of which, indeed, some evidence is to be seen in different parts of Europe, at least a half-century earlier than the time fixed above. Thus in England the monk, Roger Bacon, who died in 1294, had done a great deal of needed work in asserting the necessity of studying nature directly by observation and in a sense by experiment, disregarding in the main the opinions of churchmen, schoolmen or professors in the universities. Marco Polo, traveling with his father and uncle, at the close of the 13th century, throughout a large part of Asia, visiting China and Japan, published in his account of his voyages that which had not been guessed before about the Far East. The third Crusade, under Philip Augustus of France and Richard I. of England, had closed in 1192; and the fourth Crusade with the capture of Constantinople by the Latins ended with 1204, while the later expeditions of John of Brienne and of Louis IX. all ended by 1270; and while these expeditions failed utterly in their main object, they spread through Europe the knowledge or other races, other peoples and other scholarships than that possessed by the West. The enlightened emperor Frederick II., who died in 1250, was an enthusiastic advocate of classical studies.

So in the arts of design, the wonderful achievements of the Gothic architects, though wholly mediæval in origin, were yet a step toward modern times in the general application of sound principles of construction, studied, indeed, largely by the rule of thumb and empirically, but still affecting favorably large numbers of workmen who were kept constantly employed on important structures. All the fine arts were marked in the 13th century by a rapid and on the whole permanent gain, for sculpture in connection with the great cathedrals was developed with extraordinary rapidity and reached great excellence in truth to nature and in decorative effect; and excellent designs in color grew with the growing art of decorative glass in huge windows, while all the subsidiary arts in metal, leather, and the like were

DR. IRA REMSEN,
PRESIDENT OF THE JOHNS HOPKINS UNIVERSITY,

being pushed intelligently and with vigor. Moreover, in pure literature, the works of the French poets of the South and at a later time of the Centre, tended toward a larger development in poetry and prose.

Throughout the north of Europe this progress was checked in the 14th century, partly by the ruinous wars which were waged in France by English kings finding means to divide the great nobility of northwestern Europe and to retard the growth of comfort and intelligence for nearly a century. And this fact allowed the leadership to pass to Italy. Thus in 1340, when the Hundred Years' war began in the claim asserted by Edward III. of England to the French crown, Petrarch was 36 years old and in the middle of his great labors, and his friend, Boccaccio, was following him close. These are the men who are the most famous in the early pursuit of classical learning, but there were associated with them men who were less known as original writers and whose names are therefore less celebrated, who yet did much of the heavy work of collecting and studying manuscript. The death of those two men in 1374 and 1375 may be thought to close the first epoch of the *Risorgimento*—for by this name it would be better to designate the purely Italian movement which continued for three quarters of a century.

It is to be remembered that there was still nearly a century to elapse before the general introduction of printing. The serious work done between 1340 and 1440 was done by the copying and deciphering of manuscripts, and there were no means of producing the manuscripts as cheaply and in such abundance as they were produced in the palmy days of the imperial Roman system. Then the wealthy amateur might have a number of slaves engaged in copying and mounting manuscripts, and these must have been nearly as cheap as printed books were until very recent times; but in the 14th century there was no traditional method of transcribing books other than as known to the monks of the scriptoria of monasteries, and the crabbed hand used by these transcribers must have retarded study, while at the same time no accuracy could be expected from unscholarly men under no strict and watchful supervision. These were the reasons for the marked slowness of the growth, for after the death of the two great students named above there was reaction and languor.

The fine arts were influenced at first by no study of manuscripts, but by the direct observation of Græco-Roman remains in Italy. Thus Nicolà Pisano, who died in 1278, shows in his work the effects of his own observation of Roman sarcophagi and other reliefs, and Giotto, born two years before Pisano's death, shows also, in his readiness to break away from the mediæval designs and to create for himself new dispositions of personages in sacred and legendary painting, a freedom which can hardly have come altogether from his own observation. These artists are not to be considered as men of the new movement; they were rather the last men of the mediæval epoch; and yet they were as truly the precursors of the *Risorgimento*. The work of Giovanni Pisano (about 1240-1320) and Andrea Pisano, born in 1270 but living on till 1345, marks in a still more positive fashion the beginning of a strong classi-

cal influence over the arts of design. Most influential of all was Orcagna, properly Andrea di Cione, whose active life may be set down as lasting from 1340 to 1376, and who built one of the most important buildings of the 14th century, the shrine in the church of Orsanmichele at Florence: a marvel of combined sculpture and color-inlay in an architectural composition. So, if we are considering the introduction and growth of neoclassic art at a time when all the important churches of Italy were built in that highly decorative, but insincere, misunderstood and inconsistent Italian-Gothic of the 14th century, the noble portico at Florence, called the Loggia dei Lanzi, is to be cited. It was built about 1375-80, and the designer, while he used something of the mediæval vaulting system, gave to the building an entirely non-Gothic aspect by using round arches of great span without buttresses, depending, for the security of each abutment, upon the heavy load piled upon it. The building is designed absolutely without reference to any classical Roman structure or to the Roman system of building in any way, and it is on this account closely in harmony with the artistic work done during the same epoch in painting and in sculpture. All the arts of design were at this time newly inspired by the great perfection of classical remains, and under this new inspiration turned away from the mediæval system, which, indeed, had never obtained a strong hold upon the Italians. Thus in the matter of fine art is the true *Risorgimento* a splendid epoch of early enthusiasm, which is seen prolonged into the next century and reaching its most glorious culmination in the cupola of the Cathedral of Florence, which was the work of Filippo Brunelleschi, born in 1377, and himself a sculptor of renown. He had studied in Rome and, according to the tradition, was especially interested in the cupola of the Pantheon, and yet when the managers of the cathedral employed him to roof the open central octagon of their great church, he built nothing in the least degree resembling any classical dome, but chose an outline nearly like that of a pointed arch, an octagonal plan, and a soaring cupola which dominates the whole structure, and is admirably adapted to its general Gothic style of design. This same Brunelleschi was desirous, however, to introduce the classical orders, and his important work, the chapel of the Pazzi connected with the church of Santa Croce in Florence, is the first neoclassic building.

Of nearly the same epoch as this of the architectural Rebirth is to be put down the complete triumph in sculpture of that semi-classical school which indeed used the science and the skilled conventional modeling of the Græco-Roman masters, but never their manner of thought or their artistic conception. Lorenzo Ghiberti (1380-1455) and Donatello (1386-1466) are the strongest men of this period, but Lucca della Robbia, who died about 1482, was in the first place an exquisite and many-sided artist in marble and bronze and was also the introducer of that great system of colored and glazed terra-cotta which is known by his name and which is the most unique and brilliant art of the time. Other sculptors there were, less famous but hardly less exquisite, and of them the chief is perhaps Mino da Fiesole (1400-1486). The painters of

this time are too numerous to be treated here (see PAINTING); and the special biographies of the artists of the time, especially Fra Angelico (1387-1455), Masaccio (1401-28), Fra Filippo Lippi (1412-68), Mantegna (1431-1506), Sandro Botticelli (1447-1515), Leonardo da Vinci (1452-1519), Raphael (1483-1520).

The beginning of the Renaissance in the North is with the invasion of Italy by Charles VIII. of France, successor of Louis XI. This expedition began in 1494, and within a few years from that time the French nobles who had accompanied him on his march began to return, with their minds full of new ideas as to what was possible in painting and in sculpture of the human form, and also what was to be done in the way of scholarship. Not only nobles, but men of letters, students of the universities, writers, even churchmen to a certain extent, became converted to the idea of a larger and more varied art and one which in their opinion could be based upon classical examples—and this in poetry as well as in architecture, in prose writing as well as in painting.

The discovery of America and the beginning of the great voyages undertaken by the Spanish, Portuguese and French made this second step in the Renaissance (for by this name we should call it from this time on) a thing more general than even the study of literature and art could have made it alone. By this time, too, printing had become common. By 1494 many books had been printed, the Latin letter introduced by the Italian scribes had driven out "Black Letter" for all important printing in the South of Europe, and books, though not yet cheap, were accessible, and were of superior trustworthiness in this—that all the copies of an edition were assuredly alike.

The Renaissance in the North seems to moderns in the main an artistic movement, because, at the close of the 15th century, when peace succeeded devastating war in western Europe, the spread of learning had become so general that it no longer presented the limited nature of a deliberate, studied revival. Thus François Villon (1430-about 1490) presents in his verse and his order of thought a completely modern or non-mediæval aspect, and one who may be called his successor, François Rabelais (1495-about 1553) may be thought to accept the new learning as a thing entirely recognized and within everyone's reach, much as scholars of the 19th century receive whatever their predecessors have left for them without considering the immediate causes of that achievement. But the change in architecture and all the arts of decoration was most visible beginning with the work of Jean Bullant, who flourished about 1540, Jacques Androuet du Cerceau, of about the same epoch, and Philibert Delorme, a very few years later. The question of sculpture at this time is a very curious and a somewhat difficult one. There had been, between 1450 and the accession of Francis I., in 1515, a brilliant development of an almost wholly national art in the hands of such able men as Michel Colombe, Jean Perréal, Ligier Richier and others, who indeed show a Flemish influence on the one hand and an ultramontane, or at least a semi-classical influence on the other, but who are certainly French or Burgundian in their main tendencies. These men were busily engaged in creating a school of

sculpture, the natural result of the great Gothic school pushed to greater realism and inspired with profounder knowledge. This school was destroyed by the purely classical influence coming from Italy, and at the same time the buildings of the Chateau of Ecouen (the façade on the court, more especially), those of the new Louvre, of the Palace of Fontainebleau, mark the definite adoption of Roman architecture as the standard toward which all efforts should tend. This classical tendency grew always stronger through the reigns of Francis I. (1515-47) and Henry II. (1547-59), until all art seems to perish together during the miserable religious wars of the years from 1560 to 1600.

The strange result of the Renaissance in the North was that neither painting nor sculpture reached any great achievement from the time that the classical influence was fully established until the middle of the 17th century. There were exceptions, especially in Germany, where the classical influence was less strongly felt—where it came slowly and took but a feeble hold. There the great and thoughtful artist, Albert Dürer, who died in 1528, was succeeded by the more learned and more skilful though not more artistic painter, Hans Holbein the Younger (1497-1543). In like manner there was in France and Germany as well as in the Low Countries a splendid non-classical architecture, which is worthy of study on account of its unique character. The disposition was to build with nearly the old Gothic forms, with the same high roofs, the same free placing of windows, the same disposition of the masses, while the pointed arch and other Gothic details were wholly abandoned, and even certain parts studied rather carefully from Italian examples were introduced. Thus the chateaux on the Loire and other parts of northern France, the famous town houses of what is now Belgium, and the later churches and municipal buildings of Germany and what is now Austria, were built on these lines. The buildings are by no means classical, either in proportion or in detail, neither are they Italian; and yet they are altogether different from what was built as long as the Gothic school held sway.

It has been customary among French writers to date the beginning of the Renaissance in architecture in the very heart of the flamboyant Gothic period; thus a church like that of Saint Riquier, in northern France, Saint Maclou at Rouen in Normandy, and the famous church of Brou at Bourg-en-Bresse in the south of France, are called buildings of the early Renaissance, while at the same time they are unquestionably Gothic in their conception. In this way the not perfectly definite architecture of the northern Renaissance passes on through many interesting developments until in the 17th century it is replaced by the formal work of the reign of Louis XIV. and his contemporaries.

In dealing with England and Scotland it is not usual to speak of the Renaissance at all. There were, of course, students there of the new learning, but the wars of the Roses interfered to check the growth of this, and the interest in the theological struggles of the day seems to have put an end to it altogether. The architecture known as the Elizabethan and that which followed it, known as the Jacobean, stand

RENAISSANCE PAINTING

for the Renaissance architecture of England, and this, like the building of the Continent, shows a mixture of the Gothic with the semi-classical element.

An interesting question is that which concerns the close of the Renaissance. It has always been customary for the Italians to see the termination of the Risorgimento in the complete victory of the principles which it represents. Obviously it is no longer a "re-arranging" when the end is gained; and therefore the Italians speak of the period as ending with its highest achievement. Michelangelo, who died very old (1564), is the great artist of the very close of the Renaissance. Jacopo Sansovino (died 1570) may be considered even as outside of it and coming later. Titian, Tintoretto, Veronese, and all the great Venetians are hardly ever classed as men of the rebirth. After 1550 the *decadenza* begins: or, at least, the *classicismo* is then well established, and from this the decadence soon follows. So in France it is usual to speak of the Renaissance as closing with the religious wars under the three sons of Henry II., and the art of the time of Henry IV., as of his successors, is outside of it. It is, on the other hand, customary among English writers dealing with the subject of architecture, to speak of all the neoclassic buildings since the 15th century as "Renaissance architecture." In this way even well informed architects and esteemed writers on the subject assume that Saint Peter's Church in Rome, and even Saint Paul's in London, are as much buildings of the Renaissance as the Chateau of Blois or that of Chambord. It would be altogether better for the accuracy of our thinking if this loose way of ascription could be avoided.

RUSSELL STURGIS.

Renaissance Painting. In central and northern Italy, in the 14th century, the *Giotteschi*, or scholars and imitators of Giotto, soon lost the inspiration and initiative of his art. His great principle of the direct study of nature was much neglected; portraiture, which he had undertaken with imperfect knowledge, became a distinct branch of the art only in the 15th century; and the landscape sentiment was as yet undeveloped. Nevertheless, the seeds of the great awakening of the human intellect, which brought with it a knowledge of antique art and a new intimacy with both Nature and contem-

porary man,—and a consequent development of all the arts,—were germinating; it appeared almost in the first decade of the 15th century in both Italy and the Netherlands. For this Renaissance, the art of painting presented the most favorable means of expression, of rendering the spiritual rather than the merely corporal, the intangible as well as the appearance of reality; and also as an outlet for the individuality which had been so long smothered under formulas and conventions. Rather curiously, this restoration of a long-lost art began, among the Flemish painters, with a suddenness, a completeness, which it was impossible to maintain,—the first great work which figures in the history of this restoration, the great altar-piece in the church of St. Bavon in Ghent, painted by the brothers Huybrecht (Hubert) and Jan van Eyck (q.v.), is an example of completeness of pictorial representation, spiritual and technical, which the survivor of these painters himself was not able to equal in his other works. The mastery seems complete even of the new process of oil painting, which they are generally credited with having first practically employed. (See OIL PAINTING.) Contemporary with this Flemish school of Bruges and Ghent was another of Brabant, with the centre in Brussels, founded by Rogier van der Weyden (q.v.), similar in tendencies. Holland developed an independent school, at Haarlem, the chief of which was Dierick Bouts (d. 1475), whose works show the influence of Van der Weyden, but are marked by somewhat greater luminousness and richness of color and display a knowledge of aerial perspective in landscape. In the paintings of Hans Memlinc (q.v.) of Bruges many of the archaic qualities of his predecessors disappear and are replaced by a greater suavity and feeling for beauty. The influence of the Van Eycks extended down to the end of the 15th century, and Flanders was the seat of a great artistic production, painters and students passing backward and forward between her borders and those of Italy. In France, in the latter part of the century, there was a northern school, and a smaller one in Provence, at the court of René d'Anjou; but the important paintings of this period were nearly all destroyed in the religious wars and the Revolution, and our knowledge of the art is derived chiefly from the miniatures.

The patronage which had been extended to the new art in the Netherlands, by princes, corporations, the Church and private individuals, in the 15th century, was continued in the early years of the 16th. Foremost among the important representatives of the Northern spirit was Quinten Massys (q.v.), or Massijs, of Antwerp (d. in 1530). Jan Gossart (q.v.), called Mabuse, from his native town of Maubeuge in Hainault, on the contrary, after his journey to Italy, adopted many of the characteristics of the Southern painters, which found favor in the eyes of his countrymen. The Dutch painters of this period were numerous; the first to become widely known abroad was Lucas Jakobsz (q.v.), called Lucas van Leyden. The movement toward realism and naturalism was slower in the schools of Germany, the chief of which was that of Cologne; the earliest important work now extant is the large altar-piece, a triptych, known as the *Dombild*, painted by Stephen Lochener (d. 1451). The painters of this school

RENAISSANCE PAINTING

substituted for the pictorial or distant backgrounds of the Flemings generally a flat, gold one, and they differed from them also in their retention of the disk-shaped nimbus behind the heads. The Swabian school, chiefly Alsatian, was distinguished by a remarkable artist, a bold innovator, Martin Schongauer (q.v.), the greatest master in Germany of his time, but now best known by his drawings and engravings. The schools of Ulm, Nördlingen and Augsburg were more or less influenced by the Flemish art; two families of painters, the Burckmairs and the Holbeins, combined to raise the fame of Augsburg to the highest degree. In both, an illustrious father was succeeded by a still more illustrious son,—Thoman Burckmair by Hans (q.v.), and Hans Holbein, the elder (q.v.), by his famous son of the same name. The latter, and his brother Ambrosius, are found in Basel in 1515-16. As the most brilliant representative of the German Renaissance, Hans Holbein, the younger (q.v.), rose superior to the limitations of the art of his time, and excelled in all branches. His large mural paintings have all been destroyed; but the votive picture executed for the family of the Burgomaster Meyer in 1526, his portraits—including those of the period of his sojourn in England at the court of Henry VIII.—and his designs and engravings, have been preserved. From the Franconian school, of which Nuremberg was the centre, came the most formidable of his rivals, Albrecht Dürer (q.v.), a pupil of Michael Wolgemut, painter of altar-pieces and of careful portraits, and a skilful wood-engraver. The influence of Nuremberg was diffused over a wide area,—Schleswig, eastern Germany, Bohemia and Poland.

In the north of Europe, the spirit of the Renaissance lagged somewhat behind as compared with its development under the sky of Italy. Climatic conditions, the influence of the Gothic in making angular the forms and the draperies and in diminishing the wall spaces for mural painting, a neglect of the close study of the human body, of proportion, of perspective, a general empiricism in the sciences, the scarcity of examples of antique art, a lack of intelligent and munificent patronage in Germany, even the Reformation itself,—all have been given as partial explanations of this inferiority. Notwithstanding his genius, his earnest researches, and his journey to Italy, Dürer's art remained hampered throughout his life by his mediæval limitations. The Italians, who fully appreciated his work, his imagination and intellectual power, declared that he would have been as great as the greatest of their own artists if they had been born in Florence or Rome and had studied the antique. His great influence over his contemporaries was extended by his engravings. Dürer's chief rival among his contemporaries was Albrecht Altdorfer, the Ratisbon master. Lucas Cranach, the elder, so called from his natal town in Franconia, established a school in Saxony, which survived for some years after his death, although unable to reproduce his strong individuality. In Upper Alsace, the renown of Martin Schongauer was continued by two painters, not natives of the province, Matthias Grünewald and Hans Baldung, the latter, also, betraying strongly the influence of Dürer. The school of Swabia, the most eminent and

the most learned of the German Renaissance, boasted, in addition to the Burckmairs and the Holbeins, of Martin Schaffner, the so-called Master of Ulm, and some other painters. In the Spanish peninsula, at the period of the gradual expulsion of the Moors, the demand for church pictures brought painters from both Italy and Flanders,—from the latter, among others, Jan van Eyck and Rogier van der Weyden.

Among the causes that contributed to the development of the full flower of the Renaissance in Italy,—in addition to those already mentioned,—may be cited the humanistic spirit, derived largely from the enthusiasm arising from the study of the antique, a general aspiration toward the noble and the beautiful, a new ideal of humanity. Contemporary with this was a revival of learning,—more complete than in Germany. The art of painting, however, it was necessary to re-invent; the study of the human figure, the all important subject in the art of the Renaissance, was undertaken scientifically. Church painting remained for a long time the principal feature, and it was greatly favored by the abandonment of the old Gothic type and the division of the field into panels—which permitted of larger wall spaces, of pictures even longer than they were high. These were executed in fresco, the method perfected in the school of Giotto,—*buon fresco*, painting on the last or smooth coating of plaster freshly applied to the wall and while still wet. That which could not be painted upon in the course of the day was cut out and replaced with fresh lime the next morning. In this manner the color becomes an integral part of the wall. The pigments were water colors, usually earths and minerals. Subsequent retouching was necessarily done *al secco*, on the dry wall, and this was generally considered regrettable and somewhat dangerous to the conservation of the painting. Sometimes in the contracts for decorative works we find this retouching insisted upon. Encaustic painting seems to have also been known; tempera and oil painting were usually observed for altar-screens and easel pictures, these being generally panels covered with a thin layer of plaster. For their studies and drawings, the artist worked in monochrome or *gris aille*, called by the Italians painting in *chiaro oscuro*; their colors were ground by their apprentices under their own eyes and selected with great care. The art of painting, the most eloquent expression of the Renaissance, was destined to outstrip the other manifestations, science and letters, if not architecture. Florence remained the chief seat of this art in the 15th century as in the time of Giotto, though her authority was much less than in sculpture; the leaders were Masolino and his pupil Masaccio (q.v.), to the latter is attributed the honor of having invented a new style in painting. Very different from his intelligent naturalism and fine sense of distinction was the sincere and naive piety of the work of the Dominican friar Fra Giovanni da Fiesole (q.v.), called Fra Angelico; and still more so the tasteless "realism" of Paolo di Dono, known as Paolo Uccello (q.v.). Foremost amongst the direct heirs of Masaccio were Fra Filippo Lippi (q.v.), and his son, called Filippino Lippi (q.v.); the paintings of the former betraying new qualities of color and of *morbidessa*. With him originated

RENAISSANCE PAINTING

a new type of the Madonna, afterward given its highest expression by Leonardo and Raphael, — a presentation in which only the human idyl of motherly love and infantile innocence is sought. In the religious as in the allegorical and mythological subjects of Sandro Botticelli (q.v.), something of the mediæval awkwardness of expression reappears, redeemed by the grace and charm of the conception and the color. With him are associated as exponents of a modern, ingenious spirit, Benozzo Gozzoli (q.v.), a pupil of Fra Angelico, and Pinturicchio (q.v.). Andrea Verrocchio (q.v.) is most popularly known as a sculptor, principally by his equestrian statue of Colleone, the Venetian general; Domenico Ghirlandaio (q.v.), less original than Masaccio but more finished in his expression of realism, was, next to him, the most important painter of the Florentine school of the 15th century, and had for a pupil Michelangelo.

Of the Umbrian school, the chief seat was Perugia, though in this province painting was not centralized in the cities; the mystical and serene spirit of Perugino differed from the vivacious and investigating character of his predecessors in the school. The first artist to feel the influence of Florence was Piero degli Franceschi (q.v.), but a more skilful was Luca Signorelli (q.v.), his pupil, whose great painting of the 'End of the World,' in the chapel of the cathedral of Orvieto (which had been commenced by Fra Angelico), furnished themes and figures to Michelangelo for his 'Last Judgment.' In the best works of the master of Raphael, Pietro Vanucci (q.v.), called Perugino, may be seen the same art, the same suavity and dignity, which characterize much of the early work of his famous pupil; he seems to have been the first in central Italy to master completely the new process of painting in oil.

In northern Italy, the most important centre of the arts was at Padua, the school there having been founded in the second half of the 15th century by Francesco Squarcione (q.v.), known as the "Father of Painters," and the discoverer of the genius of Andrea Mantegna (q.v.), whom he adopted at the age of 10. In this latter artist, one of the most learned, ingenious and original of his age, the first to master the complete rules of composition, the study of nature was happily balanced by a corresponding study of the antique. In Venice, enjoying a most unusual order and prosperity under the intelligent despotism of her dukes, the revival of art did not manifest itself strongly until the second half of this century, but its final florescence was one of the most brilliant of any age. Two families of painters appear in this first period, the Vivarini and the Bellini, the latter much the more famous. To them Antonello da Messina seems to have communicated the method of painting in oil, which they so soon mastered,—a love of color and splendor being one of the natural gifts of the Venetians. The head of the family was Jacopo Bellini (q.v.), who went to Florence early in his career; his sons were Gentile (q.v.) and Giovanni (q.v.), the latter praised by Albrecht Dürer at the period of his visit to Italy in 1506. In the works of these Venetians appears that "atmosphere" which is so diligently sought by the modern schools,—the feeling of space and air, of the relative position and value

of the figures in the general arrangement; the Gothic angularity and awkwardness have been replaced by a fuller knowledge. The most eminent of the followers of Gentile Bellini was Vittore Carpaccio (q.v.) (Scarpaccia), famous for his cycle of nine pictures illustrating the legend of Saint Ursula.

The greatest name in the Renaissance proper is that of Leonardo da Vinci (q.v.), b. 1452, distinguished as a scientist, an architect, a sculptor, a musician, an author, and a painter,—and qualifying painting, himself, as the noblest of the arts and as at the same time a science. But few of his pictures survive, the most famous and the most wonderful being the portrait known as the 'Mona Lisa' in the Louvre. Of his numerous followers, the most productive and the most successful in expressing some of his qualities was Bernardino Luini (q.v.). Michelangelo (q.v.), on the other hand, vehemently protested against placing painting on a level with sculpture, and, indeed, remained to the end of his days "*Michelangiolo Scultore*" rather than the painter, even in his greatest mural decorations. His first patron was Lorenzo de Medici; and it was in 1508 that the pope Julius II. commissioned him to paint the ceiling of the Sistine Chapel in the Vatican. In 1535 he commenced the 'Last Judgment' on the end wall, and it was unveiled for the Christmas festival of 1541. The qualities of his rugged genius were peculiarly those best adapted to create a school of mannerisms and conventions among his imitators, and we see his influence very strongly developed even in his lifetime, and even in the favorite pupil of Raphael, Giulio Pippi, called Giulio Romano (q.v.). To this pretentious and ignorant school of exaggerated muscular action and violent foreshortening, which flourished during the decadence of the art, was given the name of the Baroque. The art of Raphael Santi da Urbino (q.v.), so different in quality, was eminently qualified by its combination of academical distinction with suavity and grace to secure the largest need of popular favor in his own time and in succeeding ages, and his 'Madonna Sistina,' now in the Dresden Gallery, was accepted for more than three centuries as the greatest painting in the world. Andrea del Sarto (q.v.), the best colorist in the Florentine school, may be said to err only in a certain lack of deep feeling; and the versatile talent of Correggio (q.v.) leads up to the splendors of the later Venetian school of Giorgione, Palma, Vecchio and Titian, and, later still, of Paul Veronese, Tintoretto and Tiepolo, the apotheosis of the beauty of oil painting. Giorgio da Castelfranco (q.v.), so great a Giorgio that he was called Giorgione, that is, Big George, was a fellow student with Titian under Giovanni Bellini. But very few of his authenticated works survive, one of them being in the Louvre. Of Giacomo Palma, the elder (q.v.), called Palma Vecchio, more is known, over a hundred existing paintings being attributed to him, the finest being probably the altar-piece in S. Maria Formosa, Venice, a single figure of Saint Barbara. With the majestic figure of Titian, Tiziano Vecelli da Cadore (q.v.) (1477-1576), the golden period of the Renaissance may be said to end,—of all the numerous assistants who worked under him during his long life, including a brother

and a son, none inherited his power. His paintings, sacred, allegorical, mythological, and portraits, are preserved in all the great galleries of Europe; the most beautiful, and perhaps the most characteristic of this school being the so-called 'Earthly and Heavenly Love' in the Borgheze Palace in Rome. For painting after 1550, see POST-RENAISSANCE PAINTING.

WILLIAM WALTON,
Painter; Author of 'Chefs d'Œuvre,' Exposition Universelle, Paris.

Renan, ré-nān, Ernest, French historian, philosopher, and essayist: b. Tréguier, Cote-du-Nord (Brittany), 27 Feb. 1823; d. Paris 2 Oct. 1892. The priests who directed the school in Tréguier conducted his education up to his 16th year. Having proved himself a scholar of distinction, Renan was chosen in 1838 by the Abbé Dupanloup for a place in the seminary of Saint Nicolas du Chardonnet in Paris. Here he remained until, in 1842, he went to Issy, near Paris, to receive a training in philosophy previous to his entering upon his studies for the priesthood. In 1844 he was admitted to the seminary of Saint Sulpice, the chief training school of the French priesthood, where he acquired a knowledge of Hebrew, Arabic, and Syriac. The result of these studies in philology was to shake his belief in Catholic orthodoxy, and finding it impossible to enter the priesthood he quitted the seminary in 1845. While he now maintained himself by teaching in a school at Paris, he continued his historical and philological studies, aided by the counsel and assistance of his sister Henriette. In 1848 he received the Volney prize for an essay on the Semitic languages, amplified and published as 'Histoire générale et Système comparé des Langues sémitiques' (1855). In the following year he was sent on a mission to Italy by the Académie des Inscriptions et Belles-Lettres, and returning was appointed to a post in the manuscripts department of the Bibliothèque Nationale. His 'L'Avenir de la Science,' though not published till 1890, was written in 1848-9. He next published 'Averroès et Averroisme' (1852), and several 'Etudes d'Histoire religieuse' (1856). Having become known as an Oriental scholar, he was appointed a member of a commission sent by the government in 1860 to examine the remains of Phœnician civilization in Syria. It was during this journey in Pales-

tine that he wrote his famous 'Vie de Jésus' (1863). He afterward dedicated it to his sister Henriette, who, having accompanied him, had died at Byblos. During his absence Renan had been appointed professor of Hebrew in the Collège de France, but some expressions of a Unitarian character in his inaugural address conspired with his well-known hostility to traditional Christianity to deprive him of his chair, in which he was not reinstated until 1871.

The publication of the 'Life of Jesus' in 1863 gained for its author a European reputation, and was the first of a series on the 'Histoire des Origines du Christianisme,' which he made the chief labor of his life. This comprehensive work included the following further volumes: 'Les Apôtres' (1866); 'Saint Paul' (1869); 'L'Antéchrist' (1871); 'Les Evangiles et la Seconde Génération Chrétienne' (1877); 'L'Eglise Chrétienne' (1879); 'Marc Aurèle et la Fin du Monde Antique' (1882); 'Index Général' (1883). In 1888 he was elected a member of the French Academy. During 1880 he delivered the Hibbert lectures in London on 'The Influences of the Institutions, Thought, and Culture of Rome on Christianity,' and also, at the same time, lectured at the Royal Institution on Marcus Aurelius. In 1883 he was appointed administrator of the Collège de France, where he continued his labors until his death. It is not yet possible to decide with any degree of certainty the ultimate effect of his work on the religious thought of Europe; but to his own generation he was a man of unique personality, and a writer of great erudition. Besides the works already enumerated the following should be mentioned: 'De L'Origine du Language' (1857); 'Le Livre de Job' (1859); 'Essais de Morale et de Critique' (1859); 'Le Cantique de Cantiques' (1860); 'Mission de Phénicie' (1865-74); 'Questions contemporaines' (1868); 'La Réforme Intellectuelle et Morale' (1872); 'Dialogues philosophiques' (1876); 'Mélanges d'Histoire et de Voyages' (1878); 'Corpus Inscriptionum Semiticarum' (1881-9); 'L'Ecclesiaste' (1882); 'Souvenirs d'Enfance et de Jeunesse' (1883); 'Nouvelles Etudes d'Histoire religieuse' (1884); 'Discours et Conférences' (1887); 'Histoire du Peuple d'Israël' (1887-94); 'Feuilles détachées' (1892); and several dramas, such as 'Caliban' (1878), 'L'Eau de Jouvence' (1880), 'Le Prêtre de Nemi' (1885), and 'L'Abbesse de Jouarre' (1886). His 'Lettres intimes' (1896) are a fitting memorial of his devoted attachment to his excellent sister Henriette.

Around Renan's writings were waged bitter controversies "whose volume is rivalled only by their acrimony." Into those discussions it is not now necessary to enter. Renan was a kind of Democritus, viewing the world as "a charming promenade," or a pleasing spectacle with Renan in an orchestra-stall; speaking of it all with an amiable irony. Truth was to him a diamond of many facets, and he was never ready to define his position. One thing, indeed, he was confident of—his own genius. Yet he was compact of strange contradictions; for he said that he alone in his time comprehended Saint Francis of Assisi, urged doubtful priests to remain in the church, and having, as most thought, struck as severely as he could at faith, deplored its passing in France. The 'Vie de Jésus' was received

by even French readers with a large reserve on the score of taste. Based on the critical work of radical German theologians, it endeavored to reconstruct the life of Christ by the so-called scientific method of history and psychology, and to treat a subject which previous critics had approached with respect for its special character in a manner which at times amounted almost to caricature. Renan's style has been highly praised for simplicity and restraint. His influence remains strongly in French literature. The best biography of Renan is that of Madame Darmesteter (1898). Consult also: Sainte-Beuve, 'Nouveaux Lundis' (1863-72); Grant Duff, 'In Memoriam' (1893); Monod, 'Maitres d'Histoire' (1895).

René, ré-nâ, or Renatus I. (rě-nâ'tūs) of Anjou (called also **THE GOOD**), titular king of Naples: b. Angers 16 Jan. 1409; d. Aix 10 July 1480. He was the second son of Louis II., Duke of Anjou. He inherited Anjou and Provence, besides claims upon Naples, Sicily, and Jerusalem from his brother Louis III. in 1434, and these rights were confirmed by Joanna II. before her death in 1435. René had in 1420 married the daughter of Charles II., Duke of Lorraine, and had in 1431 become possessed of that dukedom. But in the same year Count Antony of Vaudemont took him prisoner, whereupon the Lorraine states appealed to the Emperor Sigismund to decide the quarrel. René in 1432 was released from his prison for a year by giving his sons as hostages. At last, in 1434, Sigismund gave a decision in René's favor. The dethroned Antony proceeded to the Duke of Burgundy, who required René again to place himself in custody. Scarcely had this been done when an embassy arrived to tender him possession of Naples and Sicily. Philip refused to set René at liberty, and the ambassadors therefore conferred the crown on his wife Isabella, whom her husband named regent of Anjou, Provence, Naples, and Sicily. Isabella set sail for Naples, but there found a competitor in Alfonso, king of Aragon, who maintained his position not only against her, but also against René himself, after he had obtained his liberty in 1437. René, obliged to abdicate, returned to Provence. The government of Lorraine he gave up to his son John, who, after his mother Isabella's death, entered into full possession under the title of John II. On this René retired to Provence to give himself to poetry and the arts. His literary remains were edited by Count de Quatrebarbes (1875).

René II., count of Anjou, grandson of René I.: d. 1508. He inherited Vaudemont, Joinville, Aumale, Mayenne, and Elbeuf in 1470 from his father, Frederick II.; and Lorraine from his mother in 1473. In 1480 he acquired the dukedom of Bar. He fought with the Swiss against Charles the Bold of Burgundy in 1477. After his grandfather ceded Lorraine to Louis XI. he tried to establish his rights by force of arms.

Renée of France, DUCHESS DE FERRARA, French princess, daughter of Louis XII.: b. Blois, France, 1510; d. Montargis, France, 1575. She was highly educated, possessed a keen intellect, and took a deep interest in religious controversies. In 1527 she was married to the Duke de Ferrara and in 1535 was converted to

Protestantism by Calvin. Her conduct was displeasing to her father who caused her four children to be taken from her and educated in the Catholic faith, and also ordered severe restrictions concerning the princess' freedom of action and compelled her to attend mass. After the death of the duke in 1559 she returned to France and resided in her castle of Montargis, where she was the patron of the French Huguenots and also of various literary celebrities. Consult: Catteau-Calleville, 'Vie de Renée de France' (1781); 'Memorials of Renée of France, Duchess of Ferrara' (1859); Fontana, 'Renata di Francia, duchessa di Ferrara' (1888-93); Rodocanachi, 'Renée de France' (1896).

Ren'egade, one who renounces his religious belief and adopts another; in particular one who gives up Christian belief for Mohammedanism: a renegade is also a traitor who, deserting the cause of his country, enters the service of his country's enemies. Among famous renegades in this sense are: Hippas, the Athenian, son of Pisistratus, who fought on the side of Sparta against Athens, and afterward joined the Persians; the Roman patrician Coriolanus, who, when exiled from Rome, took up arms with the Volscians against his country; in the Thirty Years' war, Count Mansfeld, who deserted from the Catholic to the Protestant side, and Pappenheim, who deserted from the Protestant side to the Catholic; in the 18th century the Duke de Ripperda, who had won distinction in the military service of Spain, embraced Islam and led the armies of Morocco against Spain.

Reni, Guido, gě'dō rá'ně, Italian painter: b. Bologna 4 Nov. 1575; d. there 18 Aug. 1642. His first instruction was received in Calvaert's celebrated school at Bologna where he studied the works of Albrecht Dürer. When the school of the Caracci, at Bologna, began to eclipse that of Calvaert, Guido, then 20, joined it. He visited Rome for the first time in 1602, with two of his fellow students, Domenichino and Albano. He made a second visit in 1605 and Cardinal Borghese employed him to paint a 'Crucifixion of Saint Peter' (now in the Vatican) for the church Delle Tre Fontane. The powerful manner of this picture, and several others of the same period, which manner Guido did not, however, long retain, increased his fame; and at the cardinal's request, he completed the 'Aurora' on the ceiling of the Casino in the Rospigliosi Palace. This picture has become well known and popular from the engravings of it by R. Morghen, J. Burger, and others. Paul V. at that time employed Guido to decorate a chapel on Monte Cavallo, with scenes from the life of the Virgin Mary. Guido accomplished this work to the satisfaction of the pope, and was next entrusted with the painting of the memorial chapel in Santa Maria Maggiore. To this period his 'Fortuna,' and the portraits of Sixtus V. and Cardinal Spada may be assigned. His paintings are very unequal in style and character, but generally are considered as belonging to three different manners and periods. The first comprises those pictures which resemble the manner of the Caracci, and particularly that of Caravaggio. Faces and forms, stately and grandiose, deep shadows, narrow and intense lights, high coloring, in short, an effort after great effect, distinguish his works of this first

period. The second manner is completely opposed to the first and shows the painter at his best, being sweet, natural, and unstrained. Its principal features are tender coloring, little shade, an agreeable, though often too dainty, airy and sentimental, treatment of the subject, constituting a style quite peculiar to Guido. His 'Aurora' forms the transition from the first to the second style of his paintings. A third period commences at the time when Guido worked with too much haste and had become more avaricious of money than of fame. His coloring has turned to a greenish and altogether unnatural grayness, and the general treatment is careless and weak. During the government of Pope Urban VII. Guido quarreled with his treasurer, Cardinal Spinola, respecting the price of a picture, and returned to Bologna. There he had already executed his 'St. Peter and Paul' for the house Zampiere, and the 'Murder of the Innocents' for the Dominican church, and was on the point of embellishing the chapel of the saints with his pictures when he was called back to Rome, loaded with honors, and received by the pope himself most graciously. But he soon experienced new difficulties, and in 1622 accepted an invitation to go to Naples. Believing himself unsafe at this place, on account of the hatred of the Neapolitan artists for foreign painters, he returned once more to his native city, never to quit it again. At Bologna he painted two beautiful pictures for the church Dei Mendicanti, an 'Assumption' for Genoa, and a number of others for his native city and other places, particularly for Rome. There is also a 'Magdalen' by this artist in Chiswick House, belonging to the Duke of Devonshire, of which there is an engraving by Sir Robert Strange. Equally celebrated is a painting of 'Lot and his Daughters,' in the Hampton Court collection, also engraved. In the gallery of the Louvre are several, of which the finest is the 'Centaur Nessus carrying off Dejanira.' In the Dresden Gallery is his 'Christ Wearing the Crown of Thorns.' Consult Bolognini-Amorini, 'Vita del celebre pittore Guido Reni' (1839).

Rennell, rĕn'ĕl, James, English geographer: b. Chudleigh, Devonshire, 13 Dec. 1742; d. London 29 March 1830. At 13 he entered the navy as midshipman, and was present at the siege of Pondicherry. In 1763 he entered the East India Company's sea service; the next year was appointed surveyor-general of the East India Company's dominions in Bengal and remained in the service for 13 years. Returning to England in 1777 he published his 'Bengal Atlas' (1779), a work of the highest importance for administrative and strategical purposes. This was followed by the earliest approximately correct map of India with a memoir (1783). The Royal Society, of which he had been a fellow for 10 years, gave him the Copley medal in 1791. His attention was thereafter directed to comparative geography, and in pursuance of his scheme for a great work on western Asia he published 'Geographical System of Herodotus Explained' (1800); 'Observations on the Topography of the Plain of Troy' (1814); and 'Illustrations of the Retreat of the Ten Thousand' (1816). Finally came 'A Treatise on the Comparative Geography of Western Asia' (1831). He contributed much to the field of African geography, constructing a map of north-

ern Africa for the African Association, and determining the routes taken by Hanno and in his own day by Mungo Park. Throughout his life he had been interested when not personally occupied in marine surveying and collected an immense mass of data which he began to reduce to a system about 1810. He completed current-charts of the Atlantic which were published after his death; and the name of 'Rennell's Current' was given to the current to the southward of the Scilly Islands, whose occasional northward set he was the first to explain. He published papers on the ruins of Babylon, the identity of Jerash, the shipwreck of Saint Paul, and the landing of Cæsar. In 1801 he was made an associate of the Institute of France, and in 1825 received the gold medal of the Royal Society of Literature. He was buried in Westminster Abbey. Consult: Markham, 'Major James Rennell and the Rise of Modern English Geography' (1895).

Rennes, rĕn, France, capital of the department of Ille-et-Vilaine (formerly capital of Brittany), situated at the junction of the rivers Ille and Vilaine. It is divided by the Vilaine, traversing the city from east to west, into the High and Low Town. The High Town is elegantly built on the right bank of the river; the Low Town is unprepossessing and older (11th-13th century), and suffers from frequent inundations. The buildings of interest are: The cathedral of Pseudo-Ionic style; the archiepiscopal palace; the old parliament house; and the statues of many celebrities; the town-house, containing a fine picture gallery, Veronese, Michelangelo, Tintoretto, Van Dyck, Rembrandt, and Rubens; splendid scientific and other collections; important archives, and a large library. Rennes has courts of justice of first and second instance. The industries embrace tanneries, wax-bleaching, printing, stained paper, hats, boots and shoes, gloves, and agricultural implements. There is an extensive trade in butter, honey, wax, cotton, and linen yarns, lace, earthenware, etc. Rennes is very ancient, dating from Condate, the capital of the Gallic Redones. Pop. (1901) 74,006.

Rennet, the prepared inner surface of the stomach of a young calf. It contains much pepsin, and has the property of coagulating the casein of milk and forming curd. It is prepared by scraping off the outer skin and superfluous fat of the stomach when fresh, keeping it in salt for some hours, and then drying it. When used a small piece of the membrane is cut off and soaked in water, which is poured into the milk intended to be curdled.

Rennie, rĕn'ĭ, George, English civil engineer, son of John Rennie (q.v.): b. London 3 Dec. 1791; d. there 30 March 1866. He was educated at the University of Edinburgh and in 1811 entered the office of his father. He was inspector of machinery of the mint in 1818-26 and in 1821 engaged with his brother Sir John Rennie (q.v.) in completing several important works begun by their father, among which were the breakwater at Plymouth, various docks, harbors, canals, and the London Bridge. He laid out the Liverpool and Manchester railway in 1826, was chief engineer of the Namur and Liège railway in 1846, constructed the first screw-propelled ship in the British navy, the Mermaid, in 1840, and was engaged in the construction of

naval works at Sebastopol, and other foreign ports besides those in English harbors. After the retirement of his brother, Sir John, in 1845, he conducted the business of the firm in partnership with his two sons. He was made a fellow of the Royal Society in 1822, was its vice-president in 1845, and treasurer in 1845-50.

Rennie, John, Scottish civil engineer: b. Phantassie, Haddingtonshire, 7 June 1761; d. London 4 Oct. 1821. At an early age he showed an interest in mechanics and frequented the shop of the millwright Andrew Mickle, inventor of the threshing machine. Later he spent three years at Edinburgh University, and in 1784, having already established a business of his own, he visited James Watt at Soho, Staffordshire, and by Boulton and Watt was engaged to take charge of the work of the Albion Flour Mills, Blackfriars, London. Rennie designed all the machinery, using iron instead of wood for the shafting and framing. In London his reputation rapidly increased, until he was ranked foremost among the civil engineers of Great Britain. Among his public works may be mentioned Ramsgate Harbor; Waterloo and Southwark Bridges, across the Thames, and the design of London Bridge, the structure being completed after his death; the breakwater at Plymouth, and several similar structures, where submarine masonry was carried to great perfection. He superintended likewise the execution of the Grand Western Canal, from the mouth of the Exe to Taunton; the Polbrook Canal, Cornwall; the Aberdeen Canal, uniting the Don and the Dee; that between Arundel and Portsmouth; and, his chief work in connection with inland navigation, the Kennet and Avon Canal, between Bath and Newbury, the London Docks, the East and West India Docks, the Prince's Dock at Liverpool, and those of Dublin, Greenock, and Leith were also designed by him. In prosecuting his works he made use of the diving-bell which he greatly improved, and the steam-dredging machine, apparently without the knowledge that in its invention he had been anticipated by Sir Samuel Bentham.

Rennie, Sir John, English civil engineer, younger son of John Rennie (q.v.): b. London 30 Aug. 1794; d. Bengoe, near Hertford, Hertfordshire, 3 Sept. 1874. At 16, he like his brother, began the study of engineering under his father. When his father died in 1821 he continued with his brother George to carry on the extensive business left in their hands. He made hydraulic engineering a special study, and through his efforts large tracts of land on the eastern coast of England, including part of the Lincolnshire fens, were reclaimed and made extremely productive. The finest works of the Rennies are their bridges, which may be seen in all parts of England and Scotland, London Bridge being the most massive of them all. On the occasion of the opening of this bridge in 1831 John Rennie was knighted, an honor his brother declined. After the dissolution of the partnership in 1845 Sir John practised as an architect. He introduced the system of railways in Sweden, made important surveys of the harbor of Oporto in Portugal, and designed, and in great part executed, the harbor of Ponte Delgada in the Azores, one of his latest public works. In 1845 he was elected president of the Institute of Civil Engineers. He was the author

of 'Theory, Formation and Construction of British and Foreign Harbors' (1851-4). Consult his 'Autobiography' (1875).

Ren'no Renappi, the native name for the Delaware Indians (q.v.).

Reno, rē'nō, Conrad, American lawyer: b. Alabama 28 Dec. 1859. He was graduated from the Boston University Law School in 1883 and has since practised his profession in Boston. He has published: 'State Regulation of Wages' (1891); 'Non-Residents and Foreign Corporations' (1892); 'Employers' Liability Acts' (1896-1903); 'History of the Judicial System of New England' (1900).

Reno, Jesse Lee, American military officer: b. Wheeling, W. Va., 20 June 1823; d. South Mountain, Md., 14 Sept. 1862. He was graduated from West Point in 1846, served with distinction in the Mexican War, was assistant professor of mathematics at West Point in 1849 and at the outbreak of the Civil War was commissioned brigadier-general of volunteers. He performed gallant service at Roanoke Island, Newbern, and Camden, and was promoted major-general in 1862. He participated in the battles at Manassas and Chantilly, and after repulsing the Confederates under General Lee at South Mountain, three days before the battle of Antietam, he was killed while leading a charge.

Reno, Jesse Wilford, American inventor, son of J. L. Reno (q.v.): b. Fort Leavenworth, Kan., 4 Aug. 1861. He was graduated from Lehigh University in 1883, afterward pursuing a special course in mining and engineering. In 1885-90 he was engaged in mining in Colorado, and later became an electric railway expert. In 1892 he invented the inclined elevator or moving stairway (see ESCALATOR) and in 1895 became president of the Reno Inclined Elevator Company.

Reno, Marcus Albert, American military officer: b. Illinois, about 1835; d. Washington, D. C., 31 March 1889. He was graduated from West Point in 1857, and at the outbreak of the Civil War was made 1st lieutenant in the United States army. He was promoted captain in the same year, brevetted major for gallantry at Kelly's Ford, Va., in 1863, lieutenant-colonel for services at Cedar Creek, and in 1865 was brevetted brigadier-general of volunteers and colonel of regulars for distinguished service throughout the war. In 1876 he was engaged in the campaign against the Indians under Sitting Bull, holding command second to General Custer. In the engagement in which Custer and nearly all his regiment were killed, Reno escaped through cowardice and in consequence of his failure to support his associates and other serious charges he was dismissed from the service.

Reno, Nevada, city, county-seat of Washoe County; on the Truckee River, and on the California & O., the Southern Pacific, and the Virginia & T. R.R.'s; in the extreme western part of the State, about 30 miles south of Carson City. It was settled in 1858 by eastern emigrants who had started for California. It was incorporated in 1869, and in 1901 was chartered as a city. It is in a farming and stock-raising region, and is the most important and largest city in the State. The chief industrial establishments are railroad machine shops, which have 2,200 employees; abattoir and packing house, 120

employees; electric-power plant, 50; pressed brick works, 25, and a number of smaller manufacturing. The trade is chiefly in farm products, live-stock, and manufactures. It is an important distributing point for a vast territory. The principal public buildings are a government building, eight churches, and the Nevada State Hospital for Mental Diseases. The educational institutions are the State University, opened in 1886, State Agricultural College and Experiment Station, a normal school, Academy of Our Lady, public and parish schools, and a Carnegie Library. The three banks have a combined capital of \$1,500,000, and the annual amount of business is \$38,000,000. The government is vested in a mayor and a city council of five members, all of whom are elected by the people. Pop. (1890) 3,503; (1900) 4,500. There has been a considerable increase of population since 1900.

C. A. NARCROSS,

Editor '*Reno Evening Gazette*.'

Renoir, rê-nwâr, Auguste, French painter: b. Limoges 1841. He exhibited at the first Impressionist Salon in 1874 after studying under the impressionist Monet and others of the same school. While he paints figures, principally, and possesses singular skill in depicting flesh color and skin texture, as well as facial expression, he has remarkable success in landscape, in fruit and in flowers, which he sets on the canvas with astonishing boldness, and vividness of presentation, and he is certainly one of the most original and independent of the school to which he belongs. His '*Jeunes Filles au Piano*' is a good example of his qualities. Among his portraits are those of Claude Monet, his master, and the composer Wagner. Consult: Duret, '*Les Peintres Impressionistes*' (1879).

Renouf, rê-noof, Emile, French painter: b. Paris 1845; d. there 1894. He chose for his subjects the scenery of the sea and incidents in the lives of those who live on the seashore, fishermen, etc., but he also did some good work in landscape and genre. His fine marine '*After the Storm*' is in the New York Metropolitan Museum, and his '*Helping Hand*' (a child holding to an oar, while a sturdy fisherman rows), is in the Corcoran Gallery, Washington. While in New York (1887-8) he painted '*Brooklyn Bridge*,' which at present is in the public gallery at Havre. In 1883 he was awarded a first class medal at Munich.

Renouf, Sir Peter Le Page, English Egyptologist: b. Guernsey 23 Aug. 1822; d. London 14 Oct. 1897. He was educated at Elizabeth College, whence he passed to Pembroke College, Oxford, where he came under the influence of Newman and the Tractarians, and in 1842 entered the Roman Catholic Church. From 1855 to 1864 he was professor in the Catholic University of Ireland, first of French literature and the history of philosophy, and subsequently of ancient history and Oriental languages. He began his career as an Egyptologist about 1860, and in 1863 defended the work of Young and Champollion against Sir George C. Lewis. He opposed the dogma of papal infallibility, and in connection with this subject wrote on '*The Condemnation of Pope Honorius*' (1868) and '*The Case of Pope Honorius Reconsidered*' (1869). From 1866 till 1885 he was an inspector of schools, and during 1885-91 he was keeper of

the Egyptian and Assyrian antiquities in the British Museum. In 1875 he published '*An Elementary Grammar of the Ancient Egyptian Language*' (2d ed. 1896), and in 1879 delivered a course of Hibbert lectures on the '*Origin and Growth of Religion as Illustrated by the Religion of Ancient Egypt*' (1880; 2d ed. 1884). He was knighted in 1896 for distinguished scholarship. He left unfinished a translation of the '*Book of the Dead*,' with commentary, which at the time of his death was in course of publication (1892 et seq.) in the '*Proceedings*' of the Society of Biblical Archaeology, of which he was president from 1887. The work was completed from Renouf's notes by E. Naville. Renouf was one of the most careful and trustworthy Egyptologists of his time, and, besides, a most versatile linguist. For a sketch of him, with a bibliography of his writings, consult the '*Proceedings*' of the Society of Biblical Archaeology (Vol. XIX., 1897).

Renovo, rê-nô'vô, Pa., borough in Clinton County; on a division of the Pennsylvania railroad; about 125 miles northeast of Pittsburg and 25 miles northwest of Lock Haven. It is in a region of the Alleghany Mountains noted for grand scenery, and an abundance of game. Renovo is a summer resort which is growing in favor. It has considerable industrial interests connected with the extensive bituminous coal-fields and the fire-clay deposits in the vicinity. The chief industrial establishments are the Pennsylvania railroad shops, the coal yards, and the brick works. Pop. (1900) 4,082.

Rensselaer, rên'se-lër, Ind., city, county-seat of Jasper County; on Iroquois River, and on the Chicago, Indianapolis & Louisville railroad; about 100 miles northwest of Indianapolis. It was settled in 1834 by David Nowles, John Nowles, and Joseph Yeoma. It was incorporated in 1850, and chartered as a city on 1 May 1896. Rensselaer is in an agricultural region; and its manufacturing industries are chiefly connected with farm products. It ships considerable farm produce and live-stock. There are five churches, a high school, public elementary schools, and business schools. The four banks have a combined capital of \$100,000, and the annual amount of business is \$3,000,000. The government is vested in a mayor and a council of six members elected biennially. Pop. (1890) 1,455; (1900) 2,255.

Rensselaer, N. Y., city in Rensselaer County; on the Hudson River, and on the Boston & A., and the New York C. & H. R. R.R.'s; opposite Albany and six miles south of Troy. It is connected with Albany, Troy, and other cities by electric lines; and it has connection by steamboat with many of the cities and towns on the river. Three large bridges span the Hudson and connect Rensselaer with Albany. The first settlement was made by the Dutch. It was incorporated as a village in 1815 and in 1897 was chartered as a city. It was called Greenbush until it became a city, when it took the name Rensselaer. The village of Bath was annexed in 1902. Rensselaer is a commercial and manufacturing city. The chief manufacturing establishments are a felt factory, tannery, aniline works, and shirt-waist factory. A large number of persons are employed in connection with the railroads and steamboats, and in the offices,

stores, and manufactories in Albany and Troy. There are 10 churches, two public schools, one parish school, Saint John's Academy, and Saint John's Orphan Asylum. The government is vested in a mayor and a common council of 10 members, elected biennially. Pop. (1890) 7,301; (1900) 7,466. The addition of Bath has increased the population of the city about 2,600.

Rensselaer Polytechnic Institute, located at Troy, N. Y. It was founded by Stephen Van Rensselaer in 1824 as a school of practical science, being the first school of science and the first school of engineering to be established in any English-speaking country. It was first opened to students in January 1825, and incorporated in March 1826. It was at first named the Rensselaer School; afterward the Rensselaer Institute, and finally the Rensselaer Polytechnic Institute. Lectures on land surveying and engineering were given as early as 1823; and after 1850 the Institute became more distinctly a school of civil engineering; the course at that time was lengthened from one year to three years. It now offers two courses of four years each, one in natural science and one in civil engineering. These courses include instruction in chemical analysis, mineralogy, metallurgy and assaying, as well as in the design and construction of roads, railroads, bridges, roofs, arches, dams, steam engines, electric engines, dynamos, turbines, foundations, waterworks, tunnels, sewers, and canals. The degrees of B.S. and C.E. are conferred. The students in 1904 numbered 360, and the faculty 21. Its influence has been widespread. Students have come to it from 42 of the States of the Union and 25 foreign countries, and its graduates are at present practising their profession in 45 of the States and 19 foreign countries. Its standing as a professional school is shown by the following extract from the report to the German government by Professor A. Riedler of the Royal Polytechnicum of Berlin: "The greatest number of renowned hydraulic and railroad engineers of America are graduates of this school."

PALMER C. RICKETTS,
Director of the Rensselaer Polytechnic Institute.

Rents, Law of. Rent has been defined as a certain profit, in money, provisions, chattels or labor, issuing out of lands and tenements in retribution for their use; or, rent is a definite compensation reserved by lease, to be made periodically, and payable in money, produce, other chattels, or labor, for the possession and use of land and tenements. Where one person occupies land or premises of another under an agreement, express or implied, there exists the relation of landlord and tenant. The landlord is a person whose lands are occupied and the tenant is one who occupies same. A sub-tenant is one who leases all or part of the premises from the original tenant. The relation of landlord and tenant is generally created by a lease, although it may exist without an agreement and without liability on the part of the tenant, and may arise by implication if the acts of the parties are consistent with it. The terms lessor and lessee respectively, designate the landlord and tenant. A lease is a contract by the owner of lands or tenements on one side, with one who is to pay a rent or income for its use; it differs materially from a license, which is merely a permission to perform some act with respect to land belonging

to another; mere occupancy of land under an agreement to cultivate it for a share of the crops does not establish the relation of landlord and tenant; whether or not such relation may exist in some cases depends on the intention of the parties. A tenant continuing to occupy premises without the consent of the landlord, and after the term of his lease has expired is a tenancy at sufferance, which may be terminated at the will of the landlord, or by a new tenancy, either express or implied. Where premises are leased to be occupied for such time as may be desired by the other party, it is termed a tenancy at will; such a tenancy exists when one occupies premises with the owner's permission without paying rent.

Tenancy at will is held to exist in the following cases: where one takes possession under a conveyance, lease, or contract for sale, that is invalid; or where one takes possession while negotiations are pending for a lease, or for purchase, and where one takes possession under an agreement for a lease. Statutes in some jurisdictions hold that a tenancy not governed by a lease is a tenancy at will. A tenancy at will may be terminated where the landlord leases the property to a third person for a term of years, by the death of either the landlord or tenant, by the sale of the property, or by any act on the part of the landlord amounting to a demand for possession or showing such intention. In some jurisdictions statutes require a formal notice. A tenant at will, unless it is distinctly stipulated to the contrary, is liable for a fair rental of the premises. The lessee is liable for the rent agreed upon, whether or not he takes possession; it has been held by a number of courts that an exception to this is where the premises are destroyed before the beginning of the term. Unless contained in the agreement, a landlord is not compelled to make repairs, nor is he liable for them, or any injury caused by the condition of the premises,—not even if the repairs are on account of injury by adjoining buildings. Where buildings are destroyed by fire or accidental cause, the landlord is under no implied obligation to rebuild them; if he does so, however, the tenant is entitled to occupy the new building. Where one rents part of a building, it is generally held that the landlord is under no implied obligation to keep any other part of such building in repair. Landlords are generally liable to tenants for injuries due to accidental defects, and for any negligence on his part, in relation to a part of the building occupied by another tenant, or a portion thereof, that is under his control, and is obliged to keep in repair the portion that is rented, but is under no obligation to one tenant to repair a part of the building leased to another tenant. It is an implied duty on the part of the landlord to keep passageways and approaches used by several tenants, in repair; but, unless so required by the law, or his contract, he is not obliged to keep the passageways lighted. It is also his duty to prevent any obstruction of a passageway, which would make it dangerous, and it has been held that it is a landlord's duty to remove accumulations of ice and snow.

It is held in some jurisdictions that where a building is rented to a number of tenants, it is the duty of a landlord to keep water pipes in repair and that he is liable for any negligent use,

through himself or his agent, or servants, of the water, but not for the negligence of another tenant. Notice must be given to a landlord of defects in the premises in order to render him liable for negligence in relation thereto. Generally a landlord is liable for concealing dangerous defects on the premises. An agreement to make repairs does not require the landlord to include such repairs as may be necessary from the carelessness of the tenant; on failure to make repairs in accordance with an agreement, the tenant can make the repairs and recover the cost from the landlord or bring an action on the contract and if the premises become untenable for the want of repairs the tenant may abandon the premises; a tenant must make a demand for the repairs in order to entitle him to any remedy. Repairs made by the landlord must be executed with care, and he is liable for any injury that may occur therefrom. Where premises that are in proper condition at the time of being rented, are allowed to come in a dangerous condition, a tenant is as a rule liable for injuries, such as may occur from falling roof, or defective sidewalk. It is a principle well established that a tenant cannot dispute a landlord's title except when the landlord was induced by fraud or misrepresentation to become such. An action at law at any time can be maintained by the landlord, or his assignee, to recover rent, and under ordinary circumstances no prior demand is necessary; in many jurisdictions a landlord is authorized to attach the property of a tenant. The various matters and things concerning the renting of property, and the relations of landlord and tenant, have been made the subject of statutes in some jurisdictions, and vary the general laws and customs governing these subjects.

HENRY M. EARLE.

Renuncia'tion, in law, the act of giving up a right, such as the position of an executor or administrator of an estate, or any other office, charge or claim to which the person renouncing is legally entitled. There are proper legal forms for such action.

Ren'wick, Edward Sabine, American engineer and patent expert: b. New York 3 Jan. 1823. He was graduated from Columbia in 1839 as a civil and mechanical engineer and became superintendent of large iron works at Wilkes-barre, Pa. In 1849 he began his career as a patent expert and in 1862, with his brother Henry Renwick, he repaired a break 82 feet long and 10 feet wide in the bilge of the Great Eastern while afloat, a feat deemed an impossibility by experts. He invented several machines and mechanical appliances and published 'Practical Invention' (1893).

Renwick, James, Scottish covenanter: b. Moniaive, Dumfriesshire, Scotland, 15 Feb. 1662; d. Edinburgh, 17 Feb. 1688. He was educated for the ministry at the University of Edinburgh, but upon declining to recognize Charles II. as the head of the Church was refused a degree. He finished his education at Groningen, Holland, was ordained in 1683, returned to Scotland, and engaged in preaching at conventicles. He was outlawed in 1684 as a result of publishing with Alexander Shields 'An Informatory Vindication of the Covenanters.' In 1687, as the acknowledged leader of the Cameronians, a price was

put upon his head. He was captured in the following year and executed at Edinburgh.

Renwick, James, American scientist: b. Liverpool, England, 30 May 1790; d. New York 12 Jan. 1863. He came with his parents to New York in 1794, was graduated from Columbia and in 1812 acted as instructor in natural philosophy there. In 1814 he became a topographical engineer with rank as major in the United States service and in 1820-53 was professor of chemistry and physics at Columbia. In 1840 he was engaged as one of the commissioners to survey the boundary line between United States and New Brunswick. His publications include: 'Treatise on the Steam Engine' (1830); 'Outlines of Geology' (1838); 'Applications of the Science of Mechanics to Practical Purposes' (1840); 'Memoir of De Witt Clinton' (1840); etc.

Renwick, James, American architect: b. New York 3 Nov. 1818; d. there 23 June 1895. He was son of the preceding, and was graduated at Columbia College in 1836. Among his many works are Grace Church, New York, completed in 1845; the Smithsonian Institution and the Corcoran Art Gallery, Washington, D. C.; Vassar College, Poughkeepsie; and Saint Patrick's Cathedral, New York. This list of buildings evidences the versatility of this truly learned architect, whose mastery of French Gothic, both in its details and proportions, enabled him to give New York two of the noblest ecclesiastical exteriors in the city.

Repairs. See LAW OF LANDLORD AND TENANT.

Reparative Surgery. See SURGERY.

Repeal Movement, the agitation for the repeal of the Union between Great Britain and Ireland. This agitation commenced almost at the moment of the Union, and has continued to the present time. Robert Emmet sacrificed his life to the cause of repeal in 1803. But the word repeal is most intimately connected with the name and career of Daniel O'Connell, the Irish "Liberator." O'Connell died in 1847, and the cause of repeal was taken up by the Young Ireland party of 1848; by the Fenians, whose operations came to a head in 1865-7; and finally by the Home Rule party organized under the leadership first of Isaac Butt, in 1870, and later under the leadership of Charles S. Parnell. During the celebrated Parnell Commission of 1888-9, however, the Home Rule party, through their counsel, disclaimed all desire for repeal, maintaining that their aims were confined to the obtaining of Home Rule in the strict, or restricted, sense of the word.

Repeater, in arithmetic, an indeterminate decimal in which the same figures continually recur or are repeated. A pure repeater, or circulating decimal, is one in which the repetition goes on from the beginning; as, .3333272727 A mixed repeater is one in which the repetition does not begin till after the intervention of a figure or figures; as, .1288880113636, etc. (For the algebraic method of finding the value of a repeating decimal see PROGRESSION.)

In firearms, an arm which may be caused to fire several successive shots without reloading, whether rifle, pistol, or cannon. In horology, a watch or clock made to strike the time when a spring is pushed in. Some strike the hour and

quarters, others the hour, quarter, and odd minutes. Nautically, a vessel, usually a frigate, appointed to attend each admiral in a fleet, and to repeat every signal he makes, with which she immediately sails to the ship for which it is intended, or the whole length of the fleet when the signal is general; called also a repeating ship. In telegraphy, the same as relay.

Repentance, or Contrition, as understood by divines, both Protestant and Catholic, is defined by the Council of Trent as "grief of mind and detestation of sin committed, with a purpose of sinning no more"; more specifically it is that sorrow for sin which arises out of consideration of God's goodness which sin has outraged, and which includes a resolution never more to offend God because God so deserves our love: this is the repentance called by Protestant divines "godly sorrow." The same Protestant divines recognize a second kind of repentance, which mourns that sin is attended by a penalty rather than hates sin. This differs little from the "attrition" of Catholic divines, which is an imperfect sorrow for sin arising from such motives as fear of hell, loss of heaven, the turpitude of sin.

Reporting. See JOURNALISM; NEWSPAPERS.

Repoussé, rē-poo-sā, a kind of ornamental metal work, formed in relief by striking on the metal from behind with a punch or hammer till the required forms are roughly produced in relief on the surface; the work is then finished by the process of chasing. The work of Benvenuto Cellini (1500-70), in this branch of art, is the most celebrated. Common work of this kind, as for tea or coffee pots, is executed in pewter and Britannia metal, and then electrotyped.

A piece of heavy cotton lace, or heavy open-work fabric, or a piece of a basket may be glued to a block of hard wood to serve as a sort of die for producing the impression in the metal. The fabric or basket work is not only attached to the block by means of glue, but its finer interstices are filled with glue, so as to present a surface resembling the original fabric only in the most general way. When the glue is perfectly dry and hard, the die is laid on a solid foundation, and a piece of very thin, soft copper or brass is secured to the block so as to cover the lace. A piece of cork about one fourth inch thick and about three inches wide and six or eight inches long is laid over the metal, and struck with a mallet. The cork yields sufficiently to push the metal down on the die, and cause it to take the pattern of the lace or whatever is used in forming the die. A piece of rather hard rubber packing will answer this purpose in nearly all respects as well as the cork.

Designs may be cut from strong paper or pasteboard and glued to the block, or a stencil design may be sawed from hard wood. The lines and scrolls are discontinued in places, so as to cause the wood to hold together. If it is desired to render the lines continuous at these points, they may be run through with a V-tool. Dots are picked out with a small gouge or the point of a revolving drill. In all these cases the metal is attached to the block and treated as above.

Either panels or continuous strips may be embossed in the manner described, and these are to be used in making frames, vases, and various ornamental objects. If the metal is too thin for a certain case, it may be strengthened by flowing

soft solder over the back of the plate by means of a soldering iron. As to finish, any of the several well-known methods of oxidizing or lacquering may be employed.

Bas-reliefs may easily be made by a method which is a modification of the one described. To a wooden frame is fitted a board, on which is drawn in outline the sign which is to be produced in relief. The board may be of pine or any close-grained, soft wood for lead work; but for brass or copper, the wood should be hard. To the frame is attached the plate of metal by means of screws. The board is removed from the frame, and the portion of the design which is to form the most prominent feature of the relief is sawed out of the board, when the latter is replaced in the frame, and the metal is forced into the opening of the board by pressing on the surface of the lead opposite the hole in the board, or by pounding it by means of the mallet. As soon as this feature is complete, the next in order is sawed out of the board, and the operation is repeated till all of the general features are developed. The progress of the work can be observed at any time by removing the board.

The features may be corrected or modified by working from either side of the plate by means of the convex mallet and the wooden punches and chisels. If a support is desired for any part while the work is progressing, a stout bag filled with sand may be placed under the part. A few very small bags, say 1 inch or 1½ inches, in diameter, will be found convenient. If desired, the drapery of the background may be chased by means of hard wood or metal punches, bearing the desired figures.

The relief, if of lead, looks well with an antique finish. This may be secured by rubbing the prominent portions of the relief with fine emery cloth, then going over the entire surface with a swab formed of a small roll of cotton cloth encircled by a coil of copper wire, the swab being dipped in dilute nitric acid before application to the relief.

The copper is dissolved and deposited on the bright prominent portions, while a dark deposit is made in the hollows, which when dry has a green tinge.

To give the work the appearance of antique iron the surface may be blackened by the application of a solution of sulphuret of potassium and the prominent portions may be semi-polished by briskly rubbing the entire surface with a piece of canvas or Brussels carpet.

Repplier, Agnes, American essayist: b. Philadelphia, Pa., 1 April 1855. She is of French descent, and was educated at the convent of the Sacred Heart, Torresdale. Her essays are characterized by lightness of touch, a keen sense of the humorous side of a theme, and not a little irony. She has published: 'Books and Men' (1888); 'Points of View' (1892); 'In the Dozy Hours' (1894); 'Essays in Idleness' (1893); 'Essays in Miniature' (1892); 'Varia' (1897); and 'Philadelphia: the Place and the People' (1898); 'The Fireside Sphinx' (1901). She has also compiled a 'Book of Famous Verse' (1892), and was a contributor to the 'Saturday Evening Post.'

Representative Government. Representative government in the modern meaning of the term was unknown to the ancients. Kings,

chiefs, and administrative officers were often elected by popular vote or acclamation, but neither in ancient Greece nor Rome did a body exist even remotely resembling a Congress, a Parliament, or a Reichstag. States which were not absolute despotisms were governed, as a rule, by a council of magistrates and a popular assembly, in which latter all persons with civic rights took part, and which was very much like a New England town meeting; but there is no instance of the popular assembly of ancient times developing into a representative body. The Roman Senate was composed of magistrates and ex-magistrates, and resembled the American Senate of to-day only in name. This ancient system, which appears from the standpoint of to-day both unwieldy and unruly, was well enough fitted, however, for the so-called republics in which it prevailed, and in which all power was reserved to the central city, whether Athens, Thebes, or Rome. The citizens in public assembly stood for the state, and were the state, and did not think it necessary to delegate their powers to representatives. When civic rule in Rome gave place to imperialism, the public assembly ceased to exist, while the senate was retained to register the decrees of the Cæsars, and offer honorable retirement to those who had gained imperial favor.

Representative government, as we know it to-day, is not derived, therefore, from any Roman or Greek institution. It is essentially an outgrowth of that love of liberty inherent alike in Saxon and Norman, and reached its present development through centuries of struggle and of political and social evolution. The English Parliament, with its combination of mediæval House of Lords and 20th century House of Commons, has grown gradually from beginnings dating back almost to the Norman conquest. The barons asserted their rights against tyrannical kings, and the necessities of the kings compelled them to recognize the well-to-do classes outside the nobility, who had the wealth of which the royal exchequer stood badly in need. Taxation gave birth to representation, and at length it became a recognized principle that Englishmen would not stand taxation imposed without their own consent through representatives in Parliament assembled. It was not, however, until far into the 19th century that the common people of England were permitted to have a voice in public affairs, and not until 1885 that the suffrage was bestowed on virtually all male subjects of adult age in the United Kingdom. The Parliament of to-day therefore represents the English people; less than half a century ago it represented only the privileged classes.

Representative government in the United States inherited its spirit from England, but not its form. The American system is of native origin. It developed from town-meeting to assembly, and when the new States adopted new fundamental laws, the upper house was called a senate, after the ancient Rome senate, while the right of originating measures of taxation was reserved to the popular branch of the legislature. In the United States, also, however, the right or privilege of voting was generally restricted to taxpayers and property-owners for many years after independence, and in one of the States — Rhode Island — a landholding qualification for foreign-born citizens existed until

about 15 years ago. Excepting some peculiar restrictions intended to prevent negroes from voting in certain Southern States, nearly all male citizens of adult age now possess the right to vote.

In the Hanseatic towns, in Switzerland, the Italian free cities, and other republics of the Middle Ages, representative government had no real existence so far as the common people were concerned, and the parliaments of modern Europe are not derived from the institutions of those states. The American Revolution gave the impulse and inspiration needed to awaken the people of Europe to a sense of their rights and wrongs, and the constitutions granted by monarchs on the Continent to their subjects adopted as models a mixture of the English and American systems. With the exception of Turkey and Russia every European country has a congress or parliament in which the people are represented by deputies elected according to law. Japan has a similar system, and representative government which 100 years ago was practically confined to the United States and England, is now co-extensive with civilization in every continent. See GOVERNMENT.

Representatives, House of, the designation applied to that branch of the Congress of the United States elected directly by the people, and also applied in several States to the lower body of the State legislature. The Constitution of the United States vests in the House of Representatives the sole power to originate measures affecting taxation and finance, although the Senate has the right to amend such measures when passed in the Lower House, and it sometimes happens that a financial bill adopted by the House is virtually made a new measure in the Senate, and thus amended is accepted by the House, and becomes law. As tariff legislation is one form of taxation, it originates in the Committee on Ways and Means of the House, and the chairmanship of that committee is, therefore, a place of great power and importance. When the House and the Senate cannot agree, a Conference Committee is appointed from both bodies to adjust the differences, if possible. See CONGRESS OF THE UNITED STATES.

Reproaches, or Improperia (a Latin word of the same meaning), in the Roman Missal, a part of the divine service for Good Friday. While the clergy and people are paying veneration to the representation of the Crucified before the high altar, two pair of choristers chant alternately a series of antiphons, to which two choruses respond in versicles, Greek and Latin alternately, then repeating part of the antiphon. There are 12 Improperia, the first being: "My people, what have I done to thee? or wherein have I vexed thee? For that I led thee forth of the land of Egypt thou has provided a cross for thy Saviour." Again: "I lifted thee up with mighty power; and thou hast hanged me on the gibbet of the cross."

Reprobation, a dogma of the Calvinistic creeds, which teaches the predestination of some of the children of Adam to be eternally lost. Though the word reprobation is not used in the Westminster Confession of faith, the definitive reprobation of those who are not predestinated to everlasting life is unequivocally expressed in

REPRODUCTION

this passage of the Confession (iii. 7): "The rest of mankind"—that is, all but the elect to everlasting happiness—"God was pleased, according to the unsearchable counsel of his own will, whereby he extendeth or withholdeth mercy as he pleaseth, for the glory of his sovereign power over his creatures to pass by, and to ordain them to dishonour and wrath for their sin, to the praise of his glorious grace." Among the passages of the New Testament that are cited in support of this doctrine are Rom. ix. 11-22, 1 Thess. v. 9, 1 Pet. ii. 8, Jude 4.

Reproduction, among plants and animals, is, in a broad sense, the formation by any means of new persons or individuals to continue the life of the species. According to a more strict usage, reproduction is to be distinguished from propagation, which is generally confined to the production of new persons by the development of parts of some old individual, as for example, a branch of a tree, a polyp of a coral colony, or a portion of a certain species of worm. In all essential respects such a branch or polyp or worm-segment is an individual: the entire tree or coral-colony is considered to be a compound individual. The budding and branching of common plants and of many animals is really a production of new individuals. Single branches or twigs of almost all branching plants, cut off and planted under suitable conditions, will take root and become new individuals; the only difference between such an individual and a branch of a living tree is that in one case the new person and the old are separated, whereas in the latter the new individuals remain continuous with the old. Huxley used the terms *continuous growth* and *discontinuous growth* to designate these two conditions, the idea being that all the structures derived from a single egg constitute a single individual, whether continuous or not. According to this view all the weeping willows constitute collectively one individual, however many separate trees there may be, since this plant produces no seeds, being propagated by cuttings. The same would apply to other cultivated plants which have lost the habit of producing seeds. It is thus seen that propagation is but a development of *growth*; and all reproduction is a development of this property of protoplasm.

Propagation among Plants.—Among the unicellular plants, a common mode of multiplication is by *fission*, or the separation of the cell into two parts, each of which becomes an independent (though in many cases attached) individual, eventually to split up in its turn, and so on indefinitely. Among others (*Schizomycetes*), as the yeast plant, there is a process of *gemmation* or budding of the parent cell; the buds split off, or may remain attached, but really constitute independent units. Among the mosses, almost any part of the plant body will develop into a new individual when separated and placed under the proper conditions, and portions are frequently separated spontaneously for this purpose. The root-stock in ferns is a propagating organ, and the tip of the leaf in the walking fern will take root and produce an entire plant, while the part of the leaf connected with the old plant dies away. Some liverworts produce small masses of cells called *gemmae* which are thrown off and may develop into new plants. Among the flowering plants are found

many special means of propagation. The runner of the strawberry plant is a well known example; this is a prostrate branch which, at some distance from the parent plant, takes root, sending up a stem vertically, while the runner dies away; by this means one strawberry plant may extend itself in a single season over a large area. Some plants produce aerial bulbs, which are thrown off and may develop into new plants, as the onion. Underground stems, such as the tuber (as of potato), the root-stock. (as of iris), and the bulb (as of hyacinth), also serve for propagation, spontaneous or artificial. The leaves of many flowering plants, when separated from the parent stem, put forth adventitious roots and buds (such as arise in unusual places), which develop new plants. *Begonia* and *byrophyllum* are commonly propagated in this way. Many weeds are eradicated with great difficulty because of the fact that each piece into which the farmer's spade cuts the obnoxious plants grows into a new plant.

Propagation among Animals.—Among the *Protozoa*, multiplication by fission is the common method, though this is generally supplemented by occasional conjugation of two individuals. Among certain *Infusoria* budding also occurs. Among sponges, *cœlenterates* and *Bryozoa* budding is the process that gives these animals their characteristic colonial formation. When an individual hydroid is mutilated by a portion being cut off, each part may proceed to develop what it lacks of being a complete individual. Among the *echinoderms* the starfish has the property of regeneration developed to such a remarkable degree, that a single ray of one may develop into an entire animal. Many flat-worms, round-worms and annelids have the faculty of letting each piece into which an individual may be cut up develop into a new individual, and some of them have the means and the habit of breaking up spontaneously. While many arthropods and even some vertebrates have the power to re-grow lost parts, in none of the higher groups of animals are there any capable of propagation by means of cuttings.

Reproduction Proper.—Reproduction proper is the multiplication by means of some structures specially formed for that purpose, and is of two kinds,—sexual and asexual. In asexual reproduction the bodies formed, called *spores*, are capable of developing directly into new individuals, while in sexual reproduction two reproductive bodies, called *gametes*, must first fuse together before development may begin.

Spores are produced by all plants except a few of the lower ones and such aberrant forms as have lost the habit of reproduction by special structures, and by certain of the lower animals. They consist usually of single cells having a thickened wall for protection against desiccation and other injury, and containing oil-drops or other stored-up nourishment. Plant spores are generally too small to be seen by the unaided eye, but in masses resemble so much dust, as seen in the pollen-dust of various flowers, in the dust of puff-balls, bracket-fungi, etc. Many *Algæ* and *Sporozoa* produce spores that bear cilia which enable them to move about in the water; these are called *zoöspores*.

Spores are formed in three different ways:

(1) By condensation of the protoplasmic content

REPRODUCTION

of some cell, with the formation of a special cell-wall (chlamydospores in *Mucor*, or the mass of protoplasm may escape and swim about for awhile by means of cilia, before forming a thick coat and passing through a resting stage. (2) By the splitting off of the end cells in filaments, singly or successively, these cells becoming spores, as in green-molds, red sea-weeds, puff-balls and mushrooms. (3) By the breaking up of the contents of special cells (spore-mother-cells) into few or many portions, each of which becomes a spore, as in black-mold, yeast, lichens, mosses, ferns and all spermatophytes. Animal spores are of this third type. A vegetable spore on germinating usually puts forth a delicate thread from which the plant of the next generation develops. In the lowest plants, as among the *Sporozoa*, the spore merely breaks out of its wall and changes directly into the next stage.

Sexual Reproduction.—Of sexual reproduction there are several degrees. The simplest form is *conjugation*, in which the two gametes are not only exactly alike, but are actually two entire individuals. This is well illustrated by the pond-scum and the various diatoms and desmids. Two individuals of some species of desmid will approach each other, and after coming in contact the cell-wall of each, on the side next its neighbor, will be dissolved and the protoplasm from the two cells will flow out and the two masses fuse into one, which, after forming a thick wall and resting for a period, will become a new free-moving individual. Essentially the same method is seen in black-mold and in other plants, while in *Spirogyra* the contents of one cell passes over into the other cell, where the two masses fuse. The product of the conjugation of two gametes which are, as in the cases given, essentially alike, is called a zygote; but among the lowest classes of plants and animals there already arises a differentiation between the gametes into the male *spermatozoon* (or antherozoid), and the female ovum. The process of fusion of the two differentiated gametes is called fertilization or fecundation of the egg or ovum, and the product is known as the fertilized ovum.

Alternation of Generations.—Among the liver-worts, mosses, ferns and phanerogams, as well as among certain groups of animals, there is found the phenomenon known as "alternation of generations," called by Spencer *heterogenesis*. The sporophyte, or that stage in the life-history of the plant which produces spores, does not at all resemble the gametophyte, or gamete-producing generation; moreover, the spores develop only into gametophytes, while the fertilized eggs develop only into sporophytes, thus bringing about an alternation of the sexual generation with the asexual generation.

The ordinary green plant of a liverwort or a moss is the gametophyte, producing archegonia in which the ova are formed, and antheridia in which antherozoids are formed. The antherozoids are discharged into the water and find their way into the archegonia, and fertilize the eggs in these. From the egg the sporophyte develops directly, being in the case of the mosses the "capsule" with its stalk. In the capsule the spores are produced, and after being thrown out each of these may germinate and develop into a gametophyte. In the ferns, the familiar

stage is the sporophyte; the spores, produced in groups of spore-cases or sporangia on the under surface of the leaves, or on special modified leaves, may develop, under suitable conditions, the sexual generation, or prothallium, which is a very inconspicuous, heart-shaped plate of cells, rarely over one fourth inch in diameter, bearing archegonia and antheridia on its under surface; after fecundation, the egg develops into the familiar sporophyte.

Among some of the ferns, and in all of the higher plants, two kinds of spores are formed; a large spore, the gametophyte developing from which produces only female gametes; and a small spore resulting in a gametophyte producing only male gametes. Among the flowering plants the difference between the sexual and the asexual generations is so great that one of them is very commonly entirely overlooked, even in such well known text-books as Gray's. All the trees, flowering shrubs and herbs, grasses, etc., are sporophytes, and the two kinds of spores are the pollen and the embryo-sac of the ovary. In these highest plants the male gametophyte is reduced to the pollen tube, which grows down from the stigma, into proximity of the ovule. The female gamete is still farther reduced. The male gamete is a special portion of the protoplasm in the end of the pollen-tube, while the female gamete is a special portion of the protoplasm in the embryo-sac. It is to be noted that whereas in the mosses and liverworts the sporophyte derives the bulk of its nutrition from the gametophyte, among the phanerogams the male and female gametophytes are parasitic upon the sporophyte, which does all the vegetative work. After fertilization the embryo of a new sporophyte generation is developed at the expense of the preceding sporophytic generation. This embryo is the essential part of the seed. The popular reference to seeds as reproductive organs or structures, and to the anthers and ovaries of flowers as respectively male and female, is manifestly false.

Purpose of Reproduction.—Reproduction of organisms seems to be an outcome of the fact that conditions of life are variable; for various reasons immortality of the individual is impossible, and continuation of the life of the species can therefore be secured only by multiplication of individuals. This theory is in harmony with the observed periodicity of the reproductive processes, as well as with the fact that the reproductive processes may be hastened or retarded by artificial control of the conditions. See ANATOMY; ANATOMY, COMPARATIVE; EMBRYOLOGY; SEX.

REPRODUCTIVE ORGANS — REPTILES

Reproductive Organs. See ANATOMY, COMPARATIVE.

Reptiles, or Reptilia, a class of vertebrated animals. Although no two groups of *Vertebrata* are more dissimilar in general appearance and habits, and to the popular mind might seem more unrelated than the birds and reptiles, they are, by common consent of modern systematists, combined in a superclass, the *Sauropsida*, of Huxley, or the *Monocondylia*, of Haeckel and Cope. The *Sauropsida* are distinguished by the possession of lungs, gills being permanently absent. The embryo possesses an amnion and allantois, the former being a sac investing the body, the latter a structure developed from the lower surface of the embryo, and serving for respiration. The lower jaw in *Sauropsida* is compound in that each half or ramus consists of a number of distinct pieces; while in mammals each half consists of but a single piece. The lower jaw in reptiles and birds further articulates with the skull, not directly, but through the intervention of a separate and distinct bone, the os quadratum or quadrate bone. The skull is joined to the spine by one condyle only, borne on the occipital or hinder bone of the skull; two such condyles exist in amphibians and mammals. As compared with the fishes and batrachians the basal axis of the brain-case is bony instead of cartilaginous and the parasphenoid bone is absent. The bodies of the vertebræ are formed chiefly of centra (that is, are gastrocentrous) instead of intercentra (notocentrous) as in the *Amphibia*. Very rarely and only in extinct forms is the notochord persistent. The ankle-joint is placed in *Sauropsida*, not as in mammals, between the tibia and the astragalus, but between the proximal and distal parts of the tarsus which in *Sauropsida* becomes thus divided. The coracoid bone is almost always well developed. The intestine ends in a cloaca. No complete diaphragm is developed to separate the thorax from the abdominal cavity. The corpus callosum uniting the halves or hemispheres of the cerebrum is rudimentary, no mammary glands exist, and the *Sauropsida* are oviparous or ovo-viviparous. The red blood-corpuscles are oval and nucleated. Such are the characters common to birds and reptiles.

Reptiles differ from birds in the following characters, which may therefore be taken as including the definition of the class Reptilia. The exoskeleton consists of horny scales or of bony plates (scutes), but never of feathers. The blood is cold, and two aortic arches (right and left) exist in living *Reptilia*. The heart is three-chambered in all save the crocodiles, which possess a four-chambered heart. But in all reptiles, without exception, the venous and arterial currents of blood are connected, and an impure or mixed blood is thus circulated throughout the body. The lungs do not present the open character of those of birds, but, like those of mammalia, are in modern reptiles almost always closed sacs. The tarsal and metatarsal bones of the hind limbs, which in birds are united to form a single bone, are distinct and separate in the great majority of reptiles. When a sacrum exists it bears sacral ribs, which articulate with the ilia or haunch-bones.

The body in reptiles is generally elongated, the tortoises and their allies presenting the

most notable exceptions to this rule. The limbs may be entirely wanting, as in most snakes and in many lizards; or only a pair of limbs may be developed, as in some lizards; while in most other reptiles all four members are present. The exoskeleton varies greatly in its development throughout the class. As in the tortoises and turtles and crocodiles it may attain, either separately or in combination with the endoskeleton, a high development, with superficial deposits of bone. In serpents and many lizards it is moderately developed and chiefly horny, while in some lizards the skin is comparatively unprotected. The bones of reptiles are more compact than those of lower vertebrates, and it is also notable that in reptiles the sutures, or lines of union between various bones, have a degree of persistence beyond that in other classes of the phylum. In the reptilian skeleton the five different regions into which the spine is ordinarily divided are to be recognized, except in the serpents and a few others. There are seldom more than two sacral vertebræ, and free cervical ribs are usually present. The epiphysial and other sutures of the vertebræ are retained through life. The bones of the shoulder-girdle of each side include a simple or divided scapula or shoulder-blade and an often complex coracoid bone, including precoracoid and epicoracoid, the latter bone of each side articulating with the sternum or breast-bone when the latter is present. In addition a clavicle and interclavicle may be present. The fore-limbs consist each of a humerus, radius, and ulna. The carpal bones, and normally five digits. The pelvis contains its three typical elements, ilium, ischium, and pubis, the first being often of larger size and the last usually forming a symphysis. In serpents the shoulder-girdle is totally absent and vestiges of the pelvic-girdle appear only in a few instances; and in the turtles both are enclosed within the shell, except that the clavicle and interclavicle form part of the plastron. The limbs are usually adapted for running, but sometimes for leaping and in the extinct pterodactyls for flight. In the extinct marine pelagic reptiles, and in the modern sea-turtles, they are paddle-like. The ribs in reptiles are always present, but may differ greatly in form and disposition, those of the turtles, for example, contributing toward the formation of the upper shell or carapace.

The skull of *Reptilia* possesses but a single occipital condyle, by means of which it articulates with the spine. This condyle is formed by the basi-occipital and ex-occipital elements of the cranium and is sometimes tripartite. The quadrate bone is generally firmly fixed to the skull, joining the squamosal bone above, but is freely movable in serpents and only less so in many lizards. Each half or ramus of the lower jaw is composed of dentary, angular, surangular, coronoid, splenial, and articular bones. Other regions of the skull are modified in the greatest varieties of ways in the several orders, the most important from a systematic standpoint being in the bones which form the complex roof of the temporal fossa. Primitively this roof is complete as in the stegocephalian batrachians, but by the formation of one or two openings (supra- and infra-temporal vacuities) it is divided into one (*Synapsida*) or two (*Diapsida*)

REPTILES

longitudinal bars behind the orbits. Through variations in the size and position of these openings, to which may be added emarginations, this region is modified, and may even practically disappear altogether, as in the snakes.

The teeth are generally well developed, but in the *Chelonia* are wanting, the jaws, like those of birds, being ensheathed in horn. The reptilian teeth, like those of lower *Vertebrata* generally, are adapted less for mastication than for merely retaining prey while it is being swallowed. Save in the crocodiles and in some extinct forms the teeth are not implanted in sockets or *alveoli*, but are attached in various ways and by bony union to the jaw-bones. Teeth may be borne by bones other than the jaws (for example, palate bones); and, as seen in the poison-fangs of serpents, may be modified for special purposes. The teeth vary greatly in number and are not persistent, new teeth being produced in regular order (as in crocodiles) from a growing pulp at the base of the socket, the new tooth displacing the old.

The tongue may be elongated, distensible, and bifid, as in many lizards and serpents; short, thick, and non-protrusible, as in other lizards; or completely attached and fixed throughout its entire extent, as in *Crocodylia*. The œsophagus or gullet is usually greatly distensible (as in serpents), and may be covered (as in some *Chelonia*) with retroverted spines. The stomach is mostly pyriform or pear-shaped, and (as in snakes) may, like the gullet, be capable of great distension. In *Ophidia* it exhibits an anterior dilated part, with thin walls for receiving nutriment, and a posterior hinder portion with non-distensible walls provided with glands, and adapted for digesting the food. In the crocodile the stomach resembles the gizzard of a grain-eating bird in its high muscularity.

The heart in reptiles consists of two auricles (right and left) and a ventricle, except in the *Crocodylia*, in which two auricles and two ventricles are developed. Two aortæ or main arterial trunks exist, and are respectively named right and left aortæ. These chief vessels bend round the gullet, and unite to form a single and common main-trunk for the supply of blood to the system generally. But the chief peculiarity in the circulation of all reptiles consists in the peculiar mixture of arterial with venous blood, which takes place in the aorta in such a manner that the head alone is supplied with arterial blood. Although the latter forms possess a four-chambered heart, the circulation is functionally and essentially the same as in other *Reptilia*. It therefore follows that the body in *Reptilia* is nourished by an impure or mixed blood. The reptiles exhibit sluggish habits, slow respiration, and a series of vital actions marked by no active conditions demanding a more perfect circulation or highly-oxygenated blood. The blood is cold (poikilothermic) in reptiles, that is, is but little higher in temperature than the surrounding medium, with changes in which it varies. The red blood-corpuscles are oval and nucleated.

Respiration in reptiles is carried on solely by means of lungs, the presence of branchiæ or gills in early life, and sometimes in the adult life also of batrachians, constituting a marked difference between these latter and reptilian

forms. In the *Crocodylia*, *Chelonia*, and most lizards, the lungs are equally developed, but in serpents and some lizards only one lung is fully developed, the right lung being usually abortive. The lungs may, as in snakes and other *Reptilia*, in which the body is elongated, be of proportionally large size, and may extend nearly throughout the whole length of the body cavity which is not separated by a complete diaphragm into a distinct thorax and abdomen. In the crocodiles, lizards, and serpents the respiratory action is carried on through movements of the walls of the trunks. But in turtles, in which no movements can take place, air is drawn into the lungs by a process analogous to swallowing. The larynx or organ of voice is simple in structure, no vocal cords being in general developed, although these organs appear in crocodiles and some others.

In the higher *Reptilia* the cerebrum attains a comparatively larger size than in the lower forms, while the cerebellum also attains a relatively higher development as we proceed upward. The cerebellum has no lateral lobes nor pons, while the corpora bigemina and thalami are of large size. The senses are developed in tolerable perfection. The nasal cavities are of large size, and open into the mouth through either the anterior or posterior part of the palate. In the *Crocodylia* the hinder nostrils open very far back in the mouth, enabling these animals to hold their prey under water in their mouths, and so to drown it, while their own respiration is carried on unimpeded through the nostrils. The eyes are usually of small size, and exhibit variations in structure and in the disposition of the protective coverings. Thus in snakes the eye-ball in front is covered by a transparent lid, formed by a layer of the skin, which is attached to a circle of surrounding scales, and is shed periodically, while the outer skin. In snakes the pupil of the eye is round. In the lizards movable and ordinary eyelids exist, while the turtles possess a nictitating membrane. In lizards and snakes the sclerotic coat of the eye is strengthened by a circle of bony plates, such as also occur in several extinct reptilian forms and in birds. In the chameleons the single eyelid is formed by the united lids, and through an opening in this circular lid the rays of light enter the pupil of the eye within. The tympanum of the ear is imperfectly developed in *Ophidia*, and no eustachian tube exists. In lizards the tympanic apparatus is better developed, while in chelonians the tympanic cavity is large and complicated, and a rudimentary cochlea exists. The *Crocodylia* possess a movable valve, by means of which the tympanic canal of each ear can be closed at will; and most of the structures found in the ear of higher *Vertebrata* are represented in greater or less structural detail and perfection.

The kidneys are generally placed far back and deep within the pelvic cavity. In the serpents, however, the kidneys are situated anteriorly, and are unsymmetrically placed, the right being placed higher up and in advance of the left kidney, while they are divided into small lobes. No urinary bladder exists, and the urine of the lizards is fluid, that of the serpents resembling the excrement of birds in being pasty and crystalline. In *Crocodylia* the testes are elongated, and placed in front of the kid-

neys. The penis in *Crocodylia* is single, grooved and contained within a special cloacal fold; in *Ophidia* two lateral penes exist, and these are hollow and evertible; and a double penis exists in lizards, while that of turtles is single.

The eggs are generally of relatively large size, and provided with a thick parchment-like shell and a large yolk. In many instances the eggs may be deposited in sand, and be hatched by the sun's heat.

With regard to the distribution in space of reptiles, the warm or tropical regions of the earth contain these animals not only in greatest number, but in most typical form and variety. During winter, or in the colder seasons of the year, most reptiles hibernate, and many desert species also pass into a summer sleep. Reptiles are varied in their habits, most of them being terrestrial, but many arboreal and some, including the great majority of the turtles, are aquatic. While most are strictly carnivorous or insectivorous, some subsist on a general diet and a few are purely vegetarian. Many of the extinct forms fed exclusively on fishes. Reptiles exhibit many interesting habits, but, owing to a popular prejudice against them, and the tax on the patience of the observer resulting from their inactivity and secretiveness, they have been comparatively little studied.

Because of certain resemblances in form and manners, all of the early zoologists, to and including Cuvier, classed the *Reptilia* and *Amphibia* together, and it was only when embryological data began to play an important part in taxonomy that their dissimilarity was perceived. Milne-Edwards and his contemporaries toward the middle of the 19th century were the first to recognize this in a scheme of classification. In 1860-70 when zoologists were still working under the fresh stimulus of the publication of the 'Origin of Species,' Huxley, Haeckel, and Cope almost simultaneously perceived much more clearly than had any of their predecessors the close relationship and probable community of descent of birds and reptiles. Reptilian life played a so much more important role in past ages of the earth than now, that it is not surprising that we must turn to palæontologists for nearly all of the recent advances in the classification of the groups. The scheme and nomenclature mainly followed in this work is that elaborated by Gadow in Vol. VIII. of the 'Cambridge Natural History.'

CLASS REPTILIA.

Subclass *Proreptilia*.

Subclass *Prosauria*. Orders: Microsauri, Prosauri (Rhynchocephalia, etc.).

Subclass *Theromorpha*. Orders: Pareiasauri, Theriodontia, Placodontia, Anomodontia.

Subclass *Chelonia* (Turtles). Orders: Athecæ, Testudinata.

Subclass *Dinosauria* (Dinosaurs). Orders: Sauropoda, Theropoda, Orthopoda, Ceratopsia.

Subclass *Crocodylia* (Crocodylians). Orders: Pseudosuchia, Parasuchia, Eusuchia.

Subclass *Plesiosauria*. Orders: Nothosauri, Plesiosauri.

Subclass *Ichthyosauria*. Orders: Ichthyosauri (Fish-lizards).

Subclass *Pterosauria* (Flying Reptiles). Order: Pterosauri (Pterodactyls).

Subclass *Pythonomorpha*. Orders: Dolichosauri, Mososauri.

Subclass *Sauria*. Orders: Lacertilia (Lizards); Ophidia (Serpents).

A more elaborate scheme, but one which more correctly expresses the natural relationships of the orders, has been developed by Cope, Baur, and Osborn.

The vast majority of reptilian types have become extinct. Only four orders are represented in our modern fauna, and one of these, the *Rhynchocephalia*, by only a single species, the New Zealand tuatara (q.v.). The *Crocodylia* have greatly declined in variety of forms since the close of the Mesozoic Age. The *Pythonomorpha* have become extinct, but lizards and snakes are represented in the saurian orders by a great number of species, and are the only dominant reptilian types. Reptiles flourished especially during the Mesozoic Age, to which four of the most remarkable groups were confined, the great marine reptiles (*Plesiosauria* and *Ichthyosauria*), the huge and often remarkably modified terrestrial *Dinosauria*, and the equally wonderful flying *Pterosauria*. This epoch, when the seas were shrinking and dry land increasing in extent, but when the atmosphere was heavy with moisture and carbonic-acid gas, unfitted for the respiration of high types of life, was well suited for the development of the sluggish reptiles; and they were dominant on land and sea, replacing on the one hand the amphibians and on the other the primitive types of fishes of earlier ages. With the close of the Age of Reptiles and the advent of the Eocene Period, mammals quickly rose to full dominance on the land, and many orders of reptiles, having played their parts in the evolution of life, disappeared forever. Reptiles sprang from the stegocephalian *Amphibia*. From some group of the *Theromorpha* (of the synapsidan series) mammals are supposed to have come; while birds took their origin from the diapsidan line, probably in common with some primitive dinosaurian.

Consult, besides the numerous articles in this work on special orders and kinds of reptiles, the following: Cope, 'The Crocodilians, Lizards, and Snakes of North America,' Rep. U. S. Nat. Mus. (Washington, 1900); Holbrook, 'North American Herpetology' (Philadelphia, 1842); Gadow, 'Amphibia and Reptiles' (New York, 1901); Boulenger, 'Catalogue of the Reptiles in the British Museum' (London, 1889-96); Osborn, 'The Reptilian Subclasses Diapsida and Synapsida,' Memoirs Amer. Mus. Nat. Hist. (New York, 1903); Woodward, 'Vertebrate Palæontology' (Cambridge, 1898).

J. PERCY MOORE,

University of Pennsylvania.

Rep'ton, a village of Derbyshire, England, about seven miles from Derby; it was once an episcopal see and capital of the kingdom of Mercia, and had a celebrated nunnery from 660 till its destruction by the Northmen in 874. From 1172 till the dissolution of the monasteries under Henry VIII. it was the seat of a priory of Austin friars; part of the priory buildings is incorporated in the fabric of the Repton free grammar school, founded in 1556, one of the great English public schools. The parish church is notable for its curious crypt, consisting of a centre and side aisles divided by three arches on either side.

REPUBLIC—REPUBLICAN PARTY

Republic, a word signifying a state in which the people are the source of power. The degree of popular sovereignty in republics has varied very widely in the past, most of the so-called republics having been ruled by an aristocracy which jealously guarded its own rights, but treated the multitude as little better than slaves. Real republican government may be said to date from the American Declaration of Independence, and even in the United States the government was largely one of class until about the second quarter of the 19th century, when suffrage barriers began to break down. The other so-called American republics are mostly military despotisms, in which order or disorder is maintained by force under the command of a successful general. Argentina is an exception to this rule, and Chile and Brazil are also gradually becoming inspired by the real republican spirit, while Cuba, the youngest of American republics except Panama, which has just been admitted to the family of nations, is making an excellent record. In Mexico the strong hand of Porfirio Diaz has lifted that rich republic from a chaotic, almost barbarous condition to a reign of law and order, progress and prosperity.

As an instance of the way in which the term "republic" was used or abused in the past, it may be mentioned that Poland was formerly called a republic because the king was elected by the nobles; and in the 18th century it was not uncommon to designate the German empire by the appellation of the "republic of princes." The large commercial cities of Italy, Genoa, and Venice were called republics because they were governed by an aristocracy of noble families, who appointed one of their number to be supreme chief of the state, as the *doge*. The republican institutions of the greater part of the Greek states, as well as that of Rome, at least in later times, were of a more democratic character. The first republic of any great extent in modern Europe was the confederation of the seven provinces constituting the Dutch Republic, after their separation from Spain, and which continued until the year 1815, when it became a hereditary monarchy. Switzerland became a republic after having freed itself from German rule. Great Britain was nominally a republic for 11 years, from 1649 to 1660, as also was France from 1793 to 1804. France again assumed a republican constitution in 1848, which, however, only lasted till 1852. But on the 4th of September 1870 a republic was established in France for the third time in its history, and it is likely to continue to exist. The republics created in Hungary, Italy, Baden, and Rhenish Bavaria after the revolutionary movements of 1848 were all very ephemeral. Spain possessed a republican government twice in the course of somewhat recent years—in 1868-9 and in 1873-4. Besides the quasi-republican cities of Germany—Bremen, Hamburg, and Lübeck—and the diminutive republics of San Marino, in Italy, and Andorra, the only republics in Europe at the present day are those of Switzerland and France. In the New World, on the other hand, the republican form of government prevails universally among the independent states, the most important of all the republics there being, of course, the United States.

Of the tiny republics of the world San Ma-

rino is the best known. It is situated in central Italy, and its territory covers about 33 square miles and the population numbers about 8,500 souls. This miniature state was founded in the 4th century by Saint Marinus, who, having embraced Christianity, fled there to escape the persecution under Diocletian. The capital, San Marino, is on the crest of a mountain over 2,000 feet high and has a population of 1,200. It is one of the most picturesque places in the world, being perched on perpendicular cliffs.

The small half French and half Spanish republic of Andorra, which lies in an almost inaccessible valley of the eastern Pyrenees, possesses a charter of rights dating from Charlemagne in 790. There is but one way of getting to Andorra from France and that is by the river Bolira. To reach it from Spain one has to be carried down by mule over one of the most dangerous footpaths in Europe. There are six parishes in the republic, and the whole contains about 6,000 people, the territory covering an area of 148 square miles.

Republican, the river which unites with Smoky Hill River, at Junction City, Kan., to form the Kansas River. The Republican is formed by two streams which unite in east central Colorado. The river flows northeast into Nebraska, then east and southwest, entering Kansas at Superior in Jewell County, continuing south, east, and southeast to the Kansas River.

Republican Party, The. The Republican Party was an inevitable outgrowth of the conditions which prevailed about the time of the repeal of the Missouri Compromise in 1854. The Whigs, incapable of grappling with new problems, were rapidly disintegrating; no one of the sporadic parties sprouting in the political confusion of the time was based on broad enough principles to become a truly national organization; the Republican Party, germinating in the Free Soil movement and inheriting Whig and Federalist traditions, happily combined the inspiration of a great moral principle, with the enduring quality of sane policies in Federal administration. Its origin cannot properly be ascribed to any particular date or place. The first known suggestion of the name was in a letter written by Horace Greeley. The earliest convention of importance to adopt it was held at Jackson, Mich., 6 July 1854. Virtually coincident with the Michigan convention there were conventions in Maine, Illinois, Massachusetts, Ohio, Indiana, Wisconsin, and Iowa; almost spontaneously the Republican Party had become a strong national organization. On the roster of the 33d Congress, the name "Republican" does not appear; in the 34th Congress, which met 3 Dec. 1855, there were in the Senate 15 Republicans, 42 Democrats and 5 Americans; in the House of Representatives there were 108 Republicans, 83 Democrats, and 45 Americans. The Whigs had disappeared. Nathaniel P. Banks, of Massachusetts, was chosen Speaker of the House by a combination of Republicans and Americans, after a memorable contest.

Steps were taken at once to put a ticket in the field for the approaching election of President. The chairmen of the state committees of Maine, Vermont, Massachusetts, New York, Pennsylvania, Ohio, Michigan, Indiana, and Wisconsin called an informal convention

REPUBLICAN PARTY

to meet at Pittsburg 22 Feb. 1856. A committee appointed at that meeting called a national convention to meet at Philadelphia 17 June 1856 to nominate candidates for President and Vice-President. The call was addressed to "the people of the United States, without regard to past political differences or divisions, who are opposed to the repeal of the Missouri Compromise, to the policy of the present administration, to the extension of slavery into the territories, in favor of the admission of Kansas as a free State, and of restoring the action of the Federal government to the principles of Washington and Jefferson". John C. Frémont, of California, was nominated for President, and William L. Dayton, of New Jersey, for Vice-President, on a platform, the most conspicuous plank of which read as follows:—

Resolved, That the Constitution confers upon Congress sovereign power over the territories of the United States for their government and that in the exercise of this power it is both the right and the imperative duty of Congress to prohibit in the territories those twin relics of barbarism, polygamy, and slavery.

It was essentially a one-idea convention, although resolutions were adopted favoring national aid for a railway to the Pacific coast, and liberal appropriations for rivers and harbors; but the party was not long to remain thus limited in its mission. The convention of 1860, which nominated Abraham Lincoln for President, adopted resolutions which committed the new party to the doctrine of a protective tariff, in the following clause:—

That, while providing revenue for the support of the general government by duties upon imports, sound policy requires such an adjustment of these imposts as to encourage the development of the industrial interests of the whole country; and we commend that policy of national exchanges which secures to the workmen liberal wages, to agriculture remunerative prices, to mechanics and manufacturers an adequate reward for their skill, labor, and enterprise, and to the Nation commercial prosperity and independence.

The Republican Party is thus seen almost from the beginning to have been committed to the protective policy which remains to-day one of its great principles. The election of 1856 resulted in a Democratic victory. James Buchanan received 174 electoral votes; Frémont received 114. It is perhaps fortunate that the new party did not then meet with success. Their candidate was a popular hero. No better name could have been selected about which to rally a new party devoted to a moral idea. Had the party been successful in 1856, however, the War of the Rebellion would doubtless have begun then, and Frémont by temperament and experience was ill-fitted to grapple with such a problem. The inspiration of the campaign which he led carried the Republican Party up to the momentous success of 1860. When the clouds broke, Abraham Lincoln was at the head of the state endowed beyond all other men of his time with the ability to cope with such a storm. The National Convention at Chicago, 16-18 May 1860, nominated Abraham Lincoln, of Illinois, for President, and Hannibal Hamlin, of Maine, for Vice-President. In the election which followed Lincoln and Hamlin received 180 electoral votes; all others received 123 electoral votes. In April immediately following Lincoln's inauguration, Fort Sumter was fired upon and the Civil War began. The war occupied the four years of Lincoln's administration. The Republican Party was not only charged with

the heavy work of administration, but it was responsible for the preservation of the government. When it entered upon the war, the government was without military preparation. Congress and the President were compelled to build navies, raise armies, to provide money, and to fight the battles of the Republic. In the midst of the war, on 1 Jan. 1863, the proclamation of emancipation went into effect. An election for President was held near the end of the war, in November 1864. The Democratic Party nominated General George B. McClellan, of New Jersey, for President, and George H. Pendleton, of Ohio, for Vice-President. The principal plank of its platform was a blunt declaration that the war was a failure. The Republicans at Baltimore, 7 June 1864, renominated Lincoln for President, with Andrew Johnson, of Tennessee, for Vice-President. During the early days of the campaign, even Lincoln believed the Republican ticket would be defeated at the polls, and he began preparations for a Democratic successor; but Lincoln received the electoral vote of every State not in the rebellion except Kentucky, Delaware and New Jersey—212 electoral votes; McClellan received 21.

The assassination of Lincoln, 14 April 1865, was a calamity not only to the country but also to the Republican Party, upon which was pressing at the moment the problem of reconstruction growing out of the Civil War. Lincoln had the qualities needed at that time—firmness, moderation, and political sagacity. Andrew Johnson, who succeeded to the Presidency, was ill-fitted either by temperament or by training to deal with the delicate questions which then arose. He was hot-headed, uninformed, and unbalanced in judgment. He was soon at odds with the leaders of his party in Congress, and by his obstinacy drove them to extremes which might have been avoided had the Executive been guided by a broader intelligence. All the measures of reconstruction were forced through in spite of the President's opposition. The differences became so marked that in February, 1868, articles of impeachment were brought against the President by the House of Representatives. In the impeachment proceedings in the Senate the President was not convicted. The vote was: Guilty, 35; not guilty, 19,—one less than the two thirds majority required by the Constitution for conviction.

Ulysses S. Grant, of Illinois, was the unanimous choice of the Republican National Convention, which met at Chicago 20-21 May 1868. Schuyler Colfax, of Indiana, was the candidate for Vice-President. In the election which followed, Grant and Colfax received 214 electoral votes. Seymour and Blair, the Democratic candidates, received 80. Throughout Grant's first administration, both Senate and House were strongly Republican. The 15th amendment to the Constitution having been recommended by Congress and adopted by the States, was proclaimed on 30 March 1870. To Grant fell the task of bringing the Southern States, lately in rebellion, into adjustment with the reconstructed Union. The problems of his first administration were largely those which grew out of this new relationship. The former slaves in Southern States exercised for the first time their newly acquired privilege of voting. The state governments of negroes and carpet-baggers which were set up became a scandal. The outrages com-

REPUBLICAN PARTY

mitted by Southern Democrats upon all Republicans of whatever color aroused the resentment of the North, and kept the South in a condition of disorder which necessitated constant Federal interference.

The situation in the South, coupled with differences between the administration and certain Republican leaders, conspicuous among whom were Charles Sumner and Horace Greeley, caused a defection in the Republican ranks. The discontented Republicans met at Cincinnati in May, 1872, and nominated Horace Greeley, of New York, for President, and B. Gratz Brown, of Missouri, for Vice-President. The platform declared that sectional issues should be buried, that civil service reform should be inaugurated and that specie payment should be immediately resumed. The Democratic convention at Baltimore in July accepted the Liberal Republican candidates and platform. The regular Republican convention at Philadelphia, 5-6 June, re-nominated Gen. Grant for President by acclamation, and put Henry Wilson, of Massachusetts, on the ticket with him. Grant and Wilson received 286 electoral votes out of 366.

The first two years of Grant's second administration witnessed a strong reaction against the Republican party. There was a financial panic in 1872 and 1873, and the scandals of the whiskey ring in the Treasury Department, and of the post traderships in the War Department, involving men who were regarded as close to the administration, created a strong feeling throughout the country. The general dissatisfaction resulted in a political overturn in 1874. For the first time since 1860 the House of Representatives in the 44th Congress contained a Democratic majority.

By the time the Presidential election of 1876 arrived the Republican Party had regained much of the ground it had lost. Rutherford B. Hayes, of Ohio, was nominated for President in the convention at Cincinnati 14-16 June 1876. William A. Wheeler, of New York, was nominated for Vice-President. The Democratic candidates, nominated at Saint Louis, were Samuel J. Tilden, of New York, and Thomas A. Hendricks, of Indiana. The Democrats went into the campaign with a cry of "Turn the rascals out." In the election which followed Tilden and Hendricks received a majority of the popular vote. There was a dispute in regard to the electoral votes of South Carolina, Florida, Louisiana, and Oregon. The disputed votes were finally referred to an Electoral Commission, composed of five Senators, five Representatives, and five Justices of the Supreme Court. After a long hearing, during which the country was in great excitement, the Commission awarded all the contested votes to Hayes and Wheeler, and they were declared elected, receiving 185 electoral votes. Tilden and Hendricks received 184 votes. The administration of President Hayes is notable for two reasons. He withdrew Federal troops from the South, thus leaving the negro voters at the mercy of the white population. The Southern States, which had been Republican up to 1876, now passed under Democratic control, and have remained Democratic with only occasional exceptions, ever since. Under the administration of John Sherman, as Secretary of the Treasury, specie payments were resumed and the finances of the government were fixed firmly on a substantial foundation. President Hayes had

to deal with a Democratic House of Representatives throughout his term.

In the election of 1880, James A. Garfield, of Ohio, and Chester A. Arthur, of New York, nominated at Chicago 2-8 June, were chosen President and Vice-President respectively, receiving 214 votes against 155 electoral votes cast for Hancock and English. They also received a plurality of the popular vote. For the first time since 1874 the Republicans controlled the House of Representatives. The Senate was evenly divided. President Garfield was shot on 2 July 1881, and died on 19 September, leaving the administration in the hands of President Arthur. During Arthur's administration the Civil Service Commission, was created and the first steps were taken to divorce the great body of subordinate offices in the civil service from the changes incident to party politics. Under the administration of William E. Chandler, as Secretary of the Navy, the building of the new navy was begun. A treaty was negotiated with the government of Nicaragua, looking to the construction of an inter-oceanic canal. This treaty had not been ratified by the Senate when the administration came to an end, and President Cleveland promptly withdrew it upon entering the White House. The administrations of Garfield and Arthur were marked by factional differences in the Republican Party. The elections for Congress in 1882 resulted adversely, and in the 48th Congress there was a Democratic majority of 73. Grover Cleveland was elected Governor of New York by a majority of nearly 200,000 over Secretary Folger, who had been nominated for Governor through administration influence. In the election of 1884, Blaine and Logan, the Republican candidates for President and Vice-President—nominated at Chicago 3-6 June—were defeated by Cleveland and Hendricks, the Democratic candidates, receiving 182 electoral votes as compared with 219 for their opponents. The campaign was fought almost solely on the personality of Mr. Blaine, and has never been excelled for bitterness. The result was determined by a plurality of 1,149 in a total vote of 1,200,000 in the State of New York. The Democrats controlled the House throughout the Cleveland administration, but the Republicans had a majority in the Senate, which prevented affirmative legislation of any consequence. President Cleveland brought the tariff question sharply to the front in his message of 1887, and the agitation which grew out of that message resulted in a campaign fought on the tariff issue in 1888. The Republicans in that year, in a convention at Chicago, 19-25 June, nominated Benjamin Harrison, of Indiana, for President, and Levi P. Morton, of New York, for Vice-President. The Democrats renominated President Cleveland, and placed Allen G. Thurman, of Ohio, second on the ticket. Harrison and Morton received 233 electoral votes; Cleveland and Thurman received 168. Both Senate and House were strongly Republican. The administration of President Harrison was signalized by the enactment of important legislation, and by a strong foreign policy. Thomas B. Reed was Speaker of the House of Representatives in the 51st Congress, with a narrow Republican majority. The Democratic minority essayed at the beginning of the Congress to prevent all Republican legislation by appealing to the technicalities of antiquated rules. Speaker Reed in

REPUBLICAN PARTY

the face of vehement opposition secured the adoption of new rules, under which it became possible for the majority to do business. The Reed rules, although angrily assailed by the Democratic minority, were adopted by the Democratic Party when it next came into control of the House, and they have prevailed ever since. Having obtained the power to legislate, the Republican Party in the House proceeded to enact a tariff bill in obedience to the command of the electorate. The McKinley act was signed 1 Oct. 1890. A law was passed, known as the Sherman anti-trust law, providing penalties for creating combinations in restraint of interstate trade. The House of Representatives passed a bill looking to the more efficient control of Federal elections. This measure aroused great Democratic opposition. It failed to pass the Senate. During Harrison's administration a revolution in Hawaii resulted in the deposition of Liliuokalani, the native queen. A republic was set up, and a commission was sent to Washington seeking annexation to the United States. President Harrison made a treaty of annexation which the Senate failed to ratify in the few weeks remaining of the administration. The treaty was withdrawn by President Cleveland, but Hawaii was finally annexed shortly after the return of the Republican Party to power in 1897.

The congressional election of 1890 was fought on the issue created by the McKinley bill. That act went into operation only a month before election, and there was no opportunity to observe its practical workings. Its intent and effect were misrepresented, and the Democrats carried the House of Representatives by an unprecedented majority. In the 52d Congress, the House contained 235 Democrats and only 88 Republicans. The election of 1892 resulted in turning all branches of the government over to the Democratic Party. Cleveland and Stevenson were elected President and Vice-President, receiving 277 electoral votes; Harrison and Reid, nominated at Minneapolis, 7-10 June 1892, received 145 votes. Both House and Senate were strongly Democratic in the 53d Congress. The administration had come in on a platform which denounced protection as a fraud, and declared it to be a fundamental principle of the Democratic Party that the Federal government has no constitutional power to impose and collect tariff duties except for the purposes of revenue only. The election of a Democratic President on this platform created distrust in business circles and caused a paralysis of industry which resulted in a financial panic, hitherto unequalled, during the spring of 1893. President Cleveland, assuming that the financial depression was due to the operation of the Sherman act, providing for the purchase of silver bullion, called a special session of Congress to repeal that act. The Republicans in the House and Senate combined with a small number of Democrats to carry out the President's recommendation, and finally after weeks of heated discussion the law was repealed, but the financial situation was not relieved. The money stringency continued with the dread of tariff legislation hanging over the country. A tariff bill was enacted after months of debate which did not go to the lengths recommended by the President, and which he accordingly denounced as an act of perfidy and dishonor, although he refrained from vetoing it.

The fight over the repeal of the Sherman act and over the Wilson-Gorman tariff act disrupted the Democratic party. The unpopularity of the administration's foreign policy completed the disintegration, and at the congressional elections held in 1894, the Republican Party again came into control of both branches of Congress.

In 1896 the Republicans at Saint Louis, 16-18 June, nominated William McKinley for President, and Garret A. Hobart, of New Jersey, for Vice-President, on a platform declaring for a protective tariff and for the maintenance of the gold standard. The Democratic convention at Chicago was carried away by the cry for free silver coinage at the ratio of 16 to 1. William J. Bryan, of Nebraska, and Arthur S. Sewell, of Maine, were nominated for President and Vice-President, respectively. The campaign was fought chiefly on the financial planks of the two platforms. McKinley and Hobart were elected by a decisive majority, both in the electoral college and of the popular vote. They received 271 electoral votes. Bryan and Sewell received 176 votes. Both Senate and House were strongly Republican, in the 55th Congress. Thomas B. Reed was Speaker of the House, and Nelson Dingley, of Maine, was chairman of the Committee on Ways and Means. A special session of Congress was called to carry into effect the pledges of the party with regard to the tariff. The Dingley tariff act became law 24 July 1897. It marked the beginning of a period of prosperity unequalled in the previous history of the United States.

The disturbed conditions in Cuba growing out of the uprising against Spanish misgovernment were rapidly reaching a point where intervention by the United States would have become inevitable when the destruction of the battleship *Maine* by a Spanish mine in Havana harbor on 15 Feb. 1898 roused the resentment of the people and precipitated the war with Spain. The war began on 21 April 1898. The American forces gained two great victories by sea, one in Manila Bay, on 1 May 1898; the other off Santiago harbor on 3 July. After a brief and effective campaign by land, Spain sued for peace. The treaty of peace was signed at Paris on 10 Dec. 1898. It provided for the acquisition by the United States of the island of Porto Rico in the West Indies and of the Philippine Archipelago and the island of Guam in the Pacific. It placed the island of Cuba temporarily under the guardianship of the United States. The McKinley administration undertook the government of the newly acquired territory with all the serious problems involved. It quickly set up a stable American government in Porto Rico. It brought order in Cuba under a military administration, prepared the people of the island for self-government, and on 20 May 1901 withdrew the American military forces, permitting the Cuban people to set up an independent republic of their own. In the Philippines, after four years of armed opposition by guerrilla tribes in Luzon, a civil government was finally established and the people of the island were given a degree of civil freedom such as they had not known in 400 years. Early in the McKinley administration resolutions were enacted providing for the annexation of Hawaii on terms similar to those contemplated by President Harrison in the treaty of annexa-

tion, which President Cleveland withdrew. President McKinley was renominated at Philadelphia on 19-21 June 1900. Theodore Roosevelt was nominated by acclamation for Vice-President. William J. Bryan was again nominated for President at Kansas City on 4 July, with Adlai E. Stevenson, of Illinois, for Vice-President. The Democrats re-affirmed the platform of 1896 with its declaration of free-silver. But they declared the paramount issue to be the question of imperialism. The Republican candidates received 292 votes in the electoral college; the Democratic candidates 155 votes. The Republicans retained control of both Senate and House. On 6 Sept. 1901, President McKinley was shot at Buffalo by the anarchist Czolgosz. On 14 September he died. Vice-President Roosevelt succeeded to the Presidency. He pledged himself to carry out the McKinley policies under which the country had experienced unparalleled prosperity and he retained all members of President McKinley's cabinet. During President Roosevelt's administration all laws were strictly enforced. The army was reorganized and a strong foreign policy maintained so successfully that, in 1904, the popular demand for his re-nomination was imperative. He was elected, therefore, by a vote of 336 to 140 cast for Judge Parker. Charles W. Fairbanks, of Indiana, was the candidate for the vice-presidency.

Since the Republican Party came into power for the first time in 1861 it has been continuously in possession of the Presidency except during the periods between 1884 and 1888 and between 1892 and 1896. It has been in control of the House of Representatives except during the 44th, 45th, 46th, 48th, 49th, 50th, 52d, and 53d Congresses. It has been in control of the Senate almost continuously, the only lapse being between 1879 and 1881 and between 1893 and 1895. It has thus in effect had control of the government for 45 years and there is not a single important piece of legislation on the statute books to-day which was not placed there by the Republican Party. The only important legislation enacted by the Democratic Party in 45 years has been the Wilson-Gorman tariff act which a Democratic President allowed to become a law without his signature and which was repealed by the Congress immediately succeeding that in which it was enacted. The Republican Party has brought two wars to a successful conclusion,—the Civil War and the war with Spain. It has abolished slavery in the United States. It has placed on the statute books four protective tariff acts, the Morrill tariff of 1861, the tariff of 1883, the McKinley tariff of 1890, and the Dingley tariff of 1897. It enacted in 1862 the Homestead Law, under which the vast unoccupied territory of the West was thrown open to settlement by American citizens. It is responsible for the 13th, 14th and 15th amendments to the Constitution and for the acts of reconstruction immediately following the Civil War. It is responsible for the resumption of specie payments in 1878, and for the creation of the Civil Service Commission dissolving the subordinate offices in the government service from party politics. It is responsible for the reform of the rules of the House of Representatives under Speaker Reed enabling the majority to transact business. It is re-

sponsible for the upbuilding of the American navy until it ranks third in size among the navies of the world, and second to none in efficiency. It has reorganized the army and put it in a state of constant readiness. It has added to the national domain Alaska, Porto Rico, Guam, Hawaii, and the Philippines. It has set up an independent republic in Cuba. Since it came into power the country has increased in population from 31,443,321 in 1860 to 76,303,387 in 1900. The wealth has increased from \$16,159,616,000 in 1860 to \$94,300,000,000 in 1900.

L. A. COOLIDGE.

Republics, The History of. The word *republic* is derived from the Latin *res*, a thing, and *publicus*, belonging to the people. The word is frequently applied to any group of individuals having a common interest in their pursuits, as the republic of letters. Its general usage, however, is as a political designation for a state or country in which the supreme power of governing is vested in rulers elected periodically by those of its citizens who have acquired the right to vote. In the narrowest sense, a republic is a democracy where political power rests in all the people and is wholly in their unrestricted control. It is the antithesis of a monarchy, where the power rests in one individual or family and is self-perpetuating through dynastic succession. Between these two extremes of monarchy and democratic government are other forms, of oligarchic or aristocratic character, where the right of participation in the direction of public affairs is in the hands of classes or of a restricted portion of the community. Strictly speaking, these are not republics, but in history nearly all authorities agree in so regarding and placing them. Republics may be divided into two distinct types, the centralized and the non-centralized. A centralized republic is one in which all power is deputed to and is exercised by the general government entirely independent of local authority in any of the sub-divisions of the country. France and some of the South American republics are examples of the centralized republic. When the power of the general government is derived, to a greater or less extent,

from the local constituent bodies or states which also have independent rights and powers over which the general government has no constitutional control, we have the non-centralized republic. The Greek republics, the free cities of Germany and the United States of America are examples of the non-centralized republic.

The Earliest Republics.—In pre-historic times when men first began to feel the necessity for communal control of their affairs and interrelations, government took somewhat the form that has persisted in modern times in the monarchy. At the beginning this was patriarchal, as history shows us at later date among the Hebrews, the Pelasgians, and other early races. The head of the family was recognized as supreme in authority, first over his immediate family and then over its branches. As the associated families grew in number and size, and expanded into tribes, the strongest family or group of families asserted its pre-eminence, by force or peacefully, by common consent, and became the ruling power; hence the king and the dynasty. It was a reversion from this condition that led to the earliest republics of which history has anything to tell. Among the Israelites, the patriarchal or family government continued until the time of the Egyptian serfdom. When, under Moses, the people escaped from Egypt and became again free and independent, the Israelitish Commonwealth or Republic was established; it lasted nearly four centuries, from 1491 B. C. to 1095 B. C. Under Moses and Joshua the government was of the consolidated and centralized type. All the people, young and old, rich and poor, male and female, had a voice in public affairs and the privilege of political preferment. Here we have the earliest record of choosing rulers by elective franchise. Only the priesthood was a privileged class. Laws were beneficent and wise. A general system of education was established. The military spirit was fostered so that the nation became a strong power. Usury was illegal and interest was regarded with disfavor. An agrarian law assigned to each family a small acreage of land and this was made inalienable; it could not be held under mortgage or sale. Of this early stage of the republic it has been said that "the descendants of Abraham had reached a higher state of virtue and happiness than any other nation of that period." Upon the death of Joshua the seeds of disintegration were sown. The different states seceded, forming independent confederacies, although generally all were united for common defense. Dissensions arose, patriotism weakened, officials became dishonest and finally the people, whose will was still the highest law of the land, demanded of Samuel a king. Saul was anointed king in 1095 B. C. and that was the end of the Israelitish republic.

Greece.—In the Heroic Age, Greece was divided into several states or tribes, each ruled by a chief or king. It was about the time of the first Olympiad—776 B. C.—772 B. C., that the people began to aspire to political independence, and they gradually deposed the kings, setting up chosen rulers in place thereof. At first the new governments were oligarchal, but in the course of time, all of them, except that of Sparta, became democratic. The states were only loosely bound to each other and national unity was

altogether lacking. Athens became foremost in the time of Thucydides and exercised a sort of sovereignty over the entire country. But after a while Sparta imposed her oligarchic system upon the other states and then again Thebes had the ascendancy. Greek civilization, Greek laws, Greek art, Greek literature, Greek patriotism, became forces that have never ceased to dominate the world. But the passion for wealth and display, local political strife and particularly jealousy between the different states and cities led to dissension and disunion. Greece came under the influence of the Persian monarchs, then was ruled by the Macedonian kings, Philip and Alexander, and finally, when in 146 B. C., the Roman legions conquered Macedonia, the last Grecian league, the Achæan, and then Athens, were completely vanquished. Successively under the domination of the Roman Empire of the East, the Byzantine Empire and Turkey, Greece, finally reunited, became an independent kingdom, under a constitutional monarchy in 1832.

Carthage.—Carthage had its beginnings before history had its records. Five centuries before Christ, it flourished under rulers who were not hereditary, but who were elected by the people. The Commonwealth of Carthage was a centralized republic, unlike that of Greece and similar to that of Rome. In the Great Council of the State and in the Council of the Elders there was something of aristocracy, but on the whole the people were in control. There was a liberal administration in the interest of all citizens alike, courts of justice, banking institutions, public libraries and schools of literature and art. Carthage acquired great wealth and a high degree of civilization. Her territory was wide, extended and rich, and the city, Carthage, capital of the country, was the most superb of that day, being to the republic what Paris is to France. Carthaginians conquered the then known world, penetrated to the interior of Africa and sailed around the Cape of Good Hope, and through the British Channel. The prosperity of the Commonwealth begat its downfall. Political feuds developed and its citizens became divided into factions. Rome, grown in power, saw the opportunity for revenge for earlier defeats and humiliations. Her legions swept over the country. Carthage, the splendid city, was blotted from the face of the earth, never to reappear, and with her went every vestige of the republic of which she was the metropolis.

Rome.—Like Israel and Greece Rome had its political beginning in peoples who were organized in families, clans and tribes. In the early Roman state a king was the ruler, partly an hereditary chief and partly an elected magistrate. Naturally the kingly office grew in importance and power until in the time of the Tarquins it was well-nigh supreme. Still even during this regal period the people retained much power. The inhabitants were divided into two classes, patricians and clients, and the franchise and right of office-holding were possessed only by the former. A similar condition existed under the Etruscan kings, who ruled from the 7th century before Christ. With the deposition of Tarquin, the Proud, at the close of the 6th century before Christ, the Roman Republic began and lasted until 27 B. C., nearly five

REPUBLICS

centuries. Of the early years of the republic little is positively known. Romance and tradition make up a large part of the story. In order to curb the growing power of the executive office, administrative authority was vested in two elected consuls, with limited tenure of office, but as had always been, the franchise still remained in the patrician class to the exclusion of the plebeians. No sooner was the republic fully established than a struggle for power began between the two classes and lasted for several centuries. The patricians endeavored to establish an exclusive aristocratic government on the ruins of the monarchy, and the plebeians demanded a large participation in common civic privileges. Slowly but surely the plebeians gained. Gradually the social and political barriers between the classes were broken down and by the 3d century before Christ, practically all distinctions in regard to the franchise and office holding had disappeared. In 200 years the Romans emancipated themselves, first from kingly and then from oligarchical domination. During these and the ensuing centuries, constitutional changes were frequent, but until toward the end, generally to the enlargement of the powers of the people. Under this republican government, Rome arose to a civic distinction unparalleled at that time. The story of the city and state fills the most brilliant pages of ancient history. Her law is to-day largely the basis of law throughout the civilized world. She made herself mistress of the peninsula of Italy and then conquered the world. Her power became colossal and then her conquests proved her undoing. War made her a military nation and agriculture was neglected. The spoils of victory brought to her enormous wealth and created great fortunes for her soldiers. Inordinate extravagances followed and resultantly the condition of the poorer classes became more and more distressing. Reverence for law disappeared, many attempts were made by the aristocracy to control the power of the masses and the state became an arena on which men were merely contending for power, wealth and influence. The civil war in which Marius and Sulla were the leaders was the final struggle between the aristocratic and democratic elements. Constitutional government had been long forgotten and in the general distress all classes of citizens felt that a change of government with a strong man at the head was the only thing that could save the state. So Sulla was proclaimed dictator in 81 B. C. In form the republic endured for 50 years more under the consulships of Pompey, Cæsar, Crassus and Cicero, but it was little more than form. The dictatorship of Cæsar in 48 B. C. was another step toward the end, and Rome was ready for the empire when Octavius Augustus came to the head of the state and was proclaimed imperator in 33 B. C. Republican institutions more and more faded into the background during the life of Augustus and in all but name he was an absolute monarch. When Tiberius succeeded to the throne, Rome was an empire in reality.

Mediæval Republics.—Coming to mediæval times, there were the Lombard communes, the independent cities of Italy, the free cities of Germany and Iceland, all of which had republican forms of government. Lombardy, in the north of Italy, was a separate kingdom, part

of the Carolingian empire, or annexed to the German Empire until near the close of the 10th century. Then arose a number of independent duchies, as Mantua, Susa, Piedmont and others and several independent cities that in the 11th century became republics. Among these were: Florence, Milan, Padua, Piacenza, Treviso, Modena, Cremona, Vicenza, Bologna, and others. In them municipal organization grew up independent of church or empire that had heretofore dominated. Consuls were elected by the citizens and arts, crafts and guilds had part in the control of affairs. Between these cities there was no firm federal compact but in times of danger they formed powerful leagues for mutual defense. But although they grew in wealth, power and influence, their governments were never stable. They quarreled with each other and were torn by internal dissensions, constantly shifting between the power of the people and the power of the few. The history of Florence, which remained longest the champion of constitutional liberty, is a story of centuries of contention between the forces of democracy and oligarchy. One by one these cities finally fell before the assaults of foes, were incorporated into kingdoms, duchies or principalities, becoming, in some instances, possessions of Austria and finally were incorporated into the kingdom of Italy. In the 10th century Genoa established a free constitution. During the next two centuries the republic increased in wealth and power. A world-wide commerce was established, and many of the large cities of Southern Europe and Asia came under her control, as Marseilles, Nice, Venice, and Constantinople. At the outset, the constitution of the state leaned toward an aristocracy. A bitter antagonism between conservatism and democracy developed, changes of government became frequent, and in 1339 the citizens elected a doge for life. Three centuries later Genoa yielded to Austria and then to France, by the treaty of Vienna became a tributary city of the Sardinian monarchy and ultimately a part of the Italian kingdom. Venice had an independent government in the middle of the 6th century, her rulers being called military tribunes. From 697 to 755 the elected chief magistrate was the doge, whose authority was well-nigh imperial. Universal suffrage existed, but during the season of the republic's greatest prosperity, wealth and aristocracy for the most part administered public affairs. In time the democracy demanded more rights and privileges and in the 11th and 12th centuries the strife between the aristocracy and the commonalty was determined and bitter. In 1172 the government became essentially a patrician oligarchy with constantly increasing power, and in 1298 popular elections were abolished by the Great Council. Further encroachments upon the civic rights of the people, expensive wars with sister republics and selfish legislation of the oligarchy undermined patriotism, and for four centuries the classes fought with each other. In 1674 the oligarchy yielded to the commonalty and for another century the republic continued in varying fortune until Napoleon, in 1797, placed it under the domination of Austria. Amalfi, on the west coast of Southern Italy, was an independent city of 50,000 inhabitants in the 9th century and the

REPUBLICS

capital of a flourishing republic. Toward the close of the 11th century Amalfi was subjugated by the Normans.

Later Struggles.—The larger towns and communities of northwestern Europe gradually freed themselves from the exactions of feudal lords and became independent. From the beginning of the 12th century they established a large commercial intercourse between themselves and with the world. To protect themselves against marauders and to develop their commercial interests, they formed the Hanseatic League in the 13th century. Hamburg, Lubeck, Bremen, Frankfort and Cologne were the principal cities in this league, but city after city joined the union until it embraced 85, and in power matched the strongest governments of Europe. These cities were sovereign states and, while part of the German confederation or empire, they exercised full authority in their local affairs. In the Hanse confederacy they held the Baltic in dominion and controlled the foreign commerce of Northern Europe. The league lasted until 1630 although previous to that date it had been shorn of its powers. Most of the cities had been absorbed into the German kingdoms or principalities and at last only Hamburg, Lubeck, Bremen and Frankfort remained independent. In 1813 these four became free members of the German confederacy, but in 1866 Frankfort fell to Prussia. Hamburg, Lubeck and Bremen still retain their freedom in local affairs, being governed by chambers of representatives elected by popular vote. Iceland was settled by exiles from the tyranny of the princes of Norway, Denmark and Scotland, in the 10th century and a republican form of government was established in 928. At the head was placed a supreme magistrate, elected by the people and sharing authority with a general assembly. This form of government lasted for nearly 400 years and Iceland attained to civilization and a measure of prosperity. But internal dissensions sprang up and civil wars devastated the island. In 1621 the national council, by common consent of the people, invited Haco, King of Norway, to become Iceland's ruler and in 1380, again by common consent and peacefully, the island was transferred to Denmark. During the 10th, 11th, 12th, and 13th centuries, the whole of Belgium and Bavaria was split up into small dominions. In 1383 the house of Burgundy obtained control of this territory, which afterward became the 17 provinces of the Netherlands. Following the Burgundian rule came the long struggle with Spain, which ended in 1648 with the peace of Westphalia, by which the independence of the Republic of the United Provinces was acknowledged by the great powers of Europe. The provinces had formally united, with William of Orange as stadtholder, in 1580. The republic continued through many vicissitudes for two centuries, the people enjoying political freedom and the nation acquiring a high degree of power and prosperity. European politics could not withhold its hand from the Netherlands, and the Dutch provinces were in constant turmoil within and engaged in war without. In 1747, through all these influences, William IV. was made captain and admiral-general of the

whole union and stadtholder of the seven provinces: a little later these offices were made hereditary in both the male and female lines. At the time of the French Revolution, the stadtholder was driven out by the French and the old republican forms of government re-established, but in 1814 the people recalled the Prince of Orange from his exile in England and established the monarchy, under William I., King of the Netherlands.

France.—The first French republic had an inglorious career of 12 years. It began with the overthrow of the monarchy in 1792, and ended with the crowning of Napoleon as Emperor of France, in 1804. The 12 years of this republic were 12 years of terror. A state of anarchy existed, not a state of government. It was a despotism of a democratic mob united with the despotism of a democratic dictatorship. When the passion of the hour had burned itself out and Robespierre, Marat, Danton, and other leaders had fallen, France turned again to a monarchy for self-preservation. For the second time the people, in 1848, overthrew the monarchy and re-established a republic. The king, Louis Philippe, abdicated and fled to England and a new constitution was adopted, providing for a president, a council of state, and an assembly elected by popular vote. Louis Bonaparte was elected the first president, and in 1852, by an almost unanimous vote, he was accepted as hereditary emperor under the name of Napoleon III. The second empire lasted for 18 years and was succeeded by the third republic in 1870, which was in stable and unthreatened existence in 1905. The defeat of France by Germany in 1870 led to the overthrow of Napoleon III., and the Napoleonic dynasty. For more than a third of a century now France, the republic, has steadily grown in wealth and power, and is reckoned as one of the strongest nations of Europe. Its government is a pure democracy and authority is vested in a president elected for seven years, by the Congress and a Senate and Chamber of Deputies elected by the people, the latter by popular vote, and the former by an electoral body.

Switzerland.—Besides France there are now three republics in Europe. The most important is that of Switzerland. The Swiss republic dates from 1291, when the men of Uri, Schwyz and Unterwalden entered into a defensive league. Other cantons were added to the league until, in 1798, under the influence of France, the Helvetic Republic was formed with a regular constitution. In 1815 the perpetual neutrality of Switzerland and the inviolability of her territory was guaranteed by the powers of Europe. The republic is non-centralized, each canton having independent local powers. The federal government consists of a state council of members elected by the separate cantons and a national council elected by the people as a whole. The president and the vice-president are elected for terms of one year by the federal assembly. Universal suffrage prevails and the compulsory referendum and popular initiative are features of legislative procedure.

Andorra.—Andorra, in a valley of the eastern Pyrennees, between France and Spain, is under the joint suzerainty of these two countries. It was declared a free state by Charlemagne and

has always retained its independence. It is governed by a council of 24, elected by the people, and the chief executive is a member of the council, elected for life by his associates. It has a population of less than 10,000.

San Marino.—San Marino, in Italy, is the oldest existing republic in the world. It embraces five villages with a population of about 8,000. The general government is intrusted to a council of 60, the chief officer being termed Captain-Regent.

The United States.—On the western hemisphere, with the exception of the Dominion of Canada and the smaller dependencies of Great Britain, France and Denmark, every country is under a republican form of government. The United States of America is the oldest of these republics, the most extensive in territory and the largest in population. It stands among the world's greatest powers and in its influence it dominates the western world. As a nation, the United States originated in the colonies of Great Britain that existed in the eastern, middle and southern sections of the New World in the 18th century. The inhabitants of these colonies were mostly of English origin but they rebelled against the rule of the mother country and united in establishing themselves as a free nation, under the Declaration of Independence in 1776. In form of government, the country is a non-centralized republic, and its constitution and form of government have been the pattern upon which all republics have been modelled since its beginning. The president, who serves for a term of four years, is chosen by an electoral college, the members of which are elected by popular vote in the several states and represent the state-at-large and its congressional districts. The Senate consists of two members from each state, elected by the state legislature. The House of Representatives consists of members elected by popular vote in the separate congressional districts in the several states. There is a federal judiciary and in foreign relations, interstate commerce, army and navy affairs, navigation and postal service, the federal government is supreme. Each state is wholly independent in the control of its own affairs, having a form of government like the federal, a governor, upper and lower houses of legislation and state judiciary. The nation has had a prosperous existence. It had been engaged in wars with England, France, Mexico and Spain, and passed through a civil war, 1861-5, the greatest that the world has ever known. It has expanded until now it covers the northern part of the hemisphere from the Atlantic to the Pacific and from Canada on the north to Mexico on the south. As a result of the Spanish-American war, the republic entered upon a colonial policy and extended its operations across the Pacific. It acquired the Philippine Islands by the treaty of 1898 and also the islands of Porto Rico and Guam, and all three have been held as colonial dependencies. Hawaii, whose white citizens had revolted from native monarchical rule and set up an independent republic, was annexed to the United States in 1898 as a territory. For centuries the island of Cuba was under the misrule of Spain. Insurrection followed insurrection against the Spanish power, but Cuba was held fast as a

Spanish colony until the Spanish-American war, of which it was the cause. In the peace treaty between the United States and Spain, Cuba was relinquished. It was temporarily held by the United States pending the establishment of a stable home government, but in 1901 this was accomplished and in the following year, with Tomas Estrada Palma at its head, free Cuba took its place as the latest republic in the world. Universal suffrage with educational qualifications prevails, and the form of federal government and methods of election follow closely those of the United States of America.

South America.—The South American republics are ten in number, Argentine, Bolivia, Brazil, Chile, Colombia, Ecuador, Paraguay, Peru, Uruguay and Venezuela. Early in the 16th century Spain invaded and subjugated Peru and achieved a conquest of almost the entire South American continent. For three centuries she was able to master and hold not only that portion of the hemisphere, but also territories of Mexico and Central America and a great part of what is now the western and southwestern section of the United States. In South America she divided power only with Portugal. In the first quarter of the 19th century most of the South American states achieved their independence and established themselves under republican forms of government. The agitation for emancipation broke out almost simultaneously in different parts of the continent but was not always quickly or easily successful. In 1810 the Chilians revolted against the king of Spain and a junta which met at Santiago elected the Marquis de la Platte, a native Chilian, president of the republic, but it was not until 1818 that independence was formally proclaimed. A constitution was voted in 1833. The Argentine provinces freed themselves from the Spanish yoke in 1810, but were immediately embroiled in disputes and contentions among themselves. The history of the republic is a record of anarchy, civil contentions and warfare with European nations and sister republics. The existing constitution was adopted in 1853. Paraguay gained its independence in 1811, and after a short period of government by two councils, the supreme power was seized in 1815 by Dr. Jose Gaspar Rodriguez Francia, who exercised autocratic sway as dictator until his death in 1840. A state of anarchy followed and lasted two years, after which a National Congress put two consuls at the head of affairs. The dictatorship of President Lopez followed, and in 1870 a new constitution was voted, making the country a full-fledged republic. Bolivar, the liberator, began his work for freeing South America from the Spanish yoke in 1809. After alternate defeat and success, he finally triumphed, and in 1819 united New Granada and Venezuela as a republic under the name of Colombia. In 1832 the republic split up into Venezuela, Ecuador and New Granada, and after several changes in constitution and in state membership, the country became, in 1886, the Republic of Colombia. In 1820 San Martin, at the head of an invading army from the republic of Chile, entered Peru, drove out the Spanish authorities and proclaimed himself Protector. Two years

later Simon Bolivar, at the request of San Martin, entered the country and was appointed Dictator. Under Bolivar, Peru achieved her full freedom. A succession of civil wars and constitutional changes followed during a period of over 30 years. A constitution, in the modern spirit, was proclaimed in 1856 and under it the republic has continued since. In 1825 the republic of Bolivar was instituted from the southern province of Peru by Simon Bolivar and named after its founder. The constitution that was then formed underwent important modifications in 1828, 1831, 1863 and 1880. For nearly two centuries the territory of Uruguay was the subject of almost constant contention between Brazil and Buenos Ayres. In 1828, by the mediation of England, the northern part of the territory was ceded to Brazil and the southern part was erected into the republic of Uruguay, having declared its independence three years before. The constitution was established in 1830. The republic of Ecuador was constituted in 1830, as the outcome of a civil war, which separated the members of the original republic of Colombia formed by Simon Bolivar upon the ruins of the Spanish kingdom of New Granada. Its constitution was voted in 1844 and modified in 1887. Venezuela also had its origin in 1830 in the break up of the Bolivar republic of Colombia. The Spanish flag was cut down in this province in 1811 and the struggle against Spain was carried on until 1823, when the Spanish troops were completely expelled. The charter of fundamental laws was put in force in 1830 and has been several times modified. Of all the South American countries, Brazil remained longest under a monarchy. It was an apage of Portugal until 1815. The royal family of Portugal fled to Brazil in 1807 and establishing the throne there, the colony was declared a kingdom in 1815. When the royal family returned to Portugal in 1821, Brazil declared itself independent with Dom Pedro, son of Don Joao VI., of Portugal, as Emperor. The throne came to Dom Pedro II. in 1831, and he ruled until 1889, when by a revolution he was deposed and with his family exiled to Europe. Brazil was declared a republic under the name of the United States of Brazil. In origin, in career, and in form of constitutional government, the South American republics show striking similarity. The cry for liberty expressed in the French Revolution and more especially the successful establishment of the republic of the United States of America inspired the patriots of the southern part of the hemisphere to the struggle for freedom. In establishing constitutional government, they took pattern from the United States of America. Universal suffrage with age and educational qualifications prevails. The central government in each republic consists of a president and two legislative branches, a senate and a house of representatives, or house of deputies. Methods of electing the president and members of the senate and the house vary somewhat, but directly or indirectly the principle of the rule of the people is adhered to. The states or provinces that constitute each republic generally have full freedom in their local affairs, although in several republics federal officers have more or less control. Theoretically the South Amer-

ican governments are non-centralized republics. Practically the federal government is a strongly centralized power. The population may be broadly divided, as far as government is concerned, into two classes, the ignorant and indifferent, and the ambitious and turbulent. Consequently the history of these governments has been almost uniformly a story of intrigue, revolution, sanguinary civil war and domestic upheaval. Presidents have held themselves in power by bayonets, usurpers have arisen supported by the army, and dictators have ruled under the name of presidents and nominally so elected. Nearly all of the republics are laden heavily with debts and are in frequent controversy with their foreign creditors. Brazil and Chile are the most stable and most promising of these republics.

Central America.—The Central American republics are Costa Rica, Guatemala, Honduras, Nicaragua, San Salvador and Panama. Central America, after freeing itself from Spain in 1821, until which time it was known as the kingdom of Guatemala, was attached to the kingdom of Mexico. In 1823, Guatemala, Honduras, Nicaragua and San Salvador formed an independent federal union, under the name of the United States of Central America. Subsequently the states dissolved this alliance and became independent, Guatemala in 1847, Honduras in 1839, Nicaragua in 1858, Costa Rica in 1829 and San Salvador in 1853. These republics are republics only in name. Each has a constitutional government and popular suffrage. In form the federal authority consists of a president, and two legislative houses. In fact, the government is always in the hands of a few strong men who exercise autocratic power. Revolutions are frequent, the factions resort to arms whenever desire or opportunity impels, and there is no security of life or property. Panama, which may, perhaps, be considered as belonging almost as much to South America as to Central America, was originally part of the republic of Colombia. When the latter country hesitated in coming to an understanding with the United States in regard to the construction of the Panama canal in 1903, the department of Panama seized the opportunity to secede from her associate. There was a bloodless revolution of a few days. Panama declared itself an independent republic and was recognized at once by the United States. Now that the work upon the Panama canal through its territory has been begun, it is practically under the protection of the United States.

West Indies.—In the West Indies is an island on which there are two nominal republics, known as the black republics. Hayti, governed first by Spain and then by France, became free in 1793. First the free colored population gained the franchise in 1791 and then all the negroes in 1793 under the leadership of Touissant l'Ouverture, acquired freedom. In the last century the island had varying fortunes, sometimes under English, French or Spanish domination, twice an empire and several times republican. San Domingo republic, on the eastern end of the island, was established in 1844. The government is in the hands of an elected president and two legislative houses, but control of affairs is constantly being changed

REPUBLICS

by revolutions and the setting up of dictatorships. The republic of Hayti, on the western end of the island, has a similar history, under a like form of government proclaimed in 1867. In both republics the government is in the hands of negroes and mulattoes who constitute almost the entire population.

Mexico.—From the time that Cortes conquered Mexico, 1518–20, that country remained in the hands of Spain for three full centuries. Finally in 1810 rebellion broke out and Iturbide, the liberator, was proclaimed emperor. Upon the death of Iturbide, the army organized a republic and Mexico was entirely freed. For nearly half a century there was only the merest semblance of government of any kind. The history of the period is a record of anarchy, intrigue, revolution, military leaderships and dictatorships. In 1857 a constitution was formed, but the existing condition of internal disorder did not terminate. The French made war against Mexico and Maximilian was created emperor by a provisional government in 1862. Upon the execution of Maximilian in 1867 the republic was more firmly established but it was not until as late as 1878 that under Porfirio Diaz the country became settled. Mexico is a federative republic, divided into states, each of which manages its own local affairs, while the whole are bound together by fundamental and constitutional laws. The powers of government are exercised by a president, senate, house of representatives and judiciary.

Africa.—On the western coast of Africa is the republic of Liberia, which represents an attempt made by American philanthropists to prove the capacity of the negro race for self-government. Founded in 1820 by the American Colonization Society, it was organized as an independent state in 1847 and acknowledged first by England and other nations of Europe and by the United States in 1861. The constitution of the republic is copied from that of the United States and the right of suffrage is inalienable to every male citizen who owns real estate. As no while man can be admitted to citizenship, and as none but citizens can hold real estate, the republic is in absolute control of men of the African race. It is a fairly prosperous country but is heavily loaded with debt and has been constantly torn by political disorder. Executive power is vested in a president and legislative power in a senate and house of representatives. In the southern part of Africa the Boers of Dutch origin founded two republics. The Orange Free State was established by Boers who in 1836 and following years quitted Cape Colony in order to separate themselves from British rule there. In 1854 the independence of the republic was declared and a constitution proclaimed. The legislative authority is vested in a single popular assembly elected by the suffrage of adult white males having property qualifications. The president is elected by universal suffrage. Similar to the history of the establishment of the Orange Free State is that of the South African Republic, known also as the Transvaal. It was formed by Boers who moved from Cape Colony and Natal and in 1852 its independence was acknowledged by Great Britain. A constitution was adopted in 1858. There was never lasting peace between the Transvaal

and its British neighbors to the south. In 1877 the country was annexed to Great Britain, but the Boers gained their freedom again under the treaty of 1881. Great Britain acquired suzerainty over the foreign relations of the republic in 1884. Friction between the two countries continued unceasingly and finally culminated in open war in 1899, which resulted in the defeat of the Boers and the addition of the republic to the South African possessions of Great Britain.

Duration of Republics.—It is not easy to set down in each case precisely the length of years that these republics have existed. Among historians there are differences, in most instances, as to the dates of beginning and ending. Some authorities date from the physical overthrow of a monarchy or other form of government preceding, others from the commencement of the struggle for popular rights, others from the adoption of a constitution and so on. Some accept as the end the accession of king or emperor, or the actual establishment of a new form of authority, while others hold that the republic really became non-existent before those events occurred to finally and formally mark its disappearance. Frequently the birth or the death of a republic has been a gradual development extending over many years, so that it is almost impossible to fix the exact time when it was fully fledged, or, on the other hand, had passed away completely. Some republics, noticeably those of South America and Central America, have had interrupted careers, republican rule in them being frequently suspended for a few months or even years, while dictators have held power although in form, at least, it has been practically continuous. Others have begun as members of a republican federation and later have been established entirely independent. Venezuela, Colombia and Ecuador were originally united in the one republic of Colombia; Guatemala, Honduras, Nicaragua and San Salvador were first members of a federal union. It is a disputed question whether such republics should be considered as dating from the beginning of the federation or from the beginning of their individual independence. In the appended table the former view is generally taken approximately then, the duration of life of the world's republics is as follows:

| | | | |
|--------------------------|-----------|-------|-------------|
| Israelitish Commonwealth | 1491-1095 | B. C. | 396 years. |
| Grecian republic | 700-146 | B. C. | 554 years. |
| Carthage | 850-146 | B. C. | 704 years. |
| Rome | 535-29 | B. C. | 506 years. |
| Lombard Communes | 1153-1530 | | 347 years. |
| Genoa | 1000-1802 | | 802 years. |
| Venice | 600-1796 | | 1196 years. |
| Amalfi | 900-1135 | | 235 years. |
| Free Cities of Germany | 1241-1630 | | 389 years. |
| Hamburg | 1630-1905 | | 275 years. |
| Lubeck | 1630-1905 | | 275 years. |
| Bremen | 1630-1905 | | 275 years. |
| Frankfort | 1630-1810 | | 180 years. |
| Iceland | 928-1261 | | 333 years. |
| The Netherlands | 1609-1805 | | 196 years. |
| French Republic I. | 1792-1804 | | 12 years. |
| French Republic II. | 1848-1852 | | 4 years. |
| French Republic III. | 1871-1905 | | 34 years. |
| San Marino | 885-1905 | | 1020 years. |
| Andorra | 790-1905 | | 1115 years. |
| Switzerland | 1291-1905 | | 614 years. |
| Liberia | 1820-1905 | | 185 years. |
| Orange Free State | 1854-1905 | | 51 years. |
| South African Republic | 1840-1903 | | 54 years. |
| United States of America | 1776-1905 | | 129 years. |
| Mexico | 1824-1905 | | 81 years. |

REPUDIATION

| | | |
|--------------------|----------------|------------|
| Venezuela | 1819-1905..... | 86 years. |
| Colombia | 1819-1905..... | 86 years. |
| Ecuador | 1819-1905..... | 86 years. |

| Hawaii | 1894-1905..... | 11 years. |
| Panama | 1903-1905..... | 2 years. |

Of these 46 republics 31 were in existence in 1905. Taken altogether, history shows that these nations have been as stable, prosperous, influential and powerful under republican forms of government as under monarchical or other form. No dynasties can compare in years of existence with the 12 centuries of Venice, the 11 centuries of Andorra, and the 10 centuries of San Marino. Few can show longer life than the republics of Israel, Carthage, Greece, Rome, Genoa, Switzerland and the Hanse cities of Germany. The ancient republics of Greece, Carthage, Rome, Lombardy, Venice and Genoa were the greatest nations of their times. In art, literature, law, commerce, all that goes to make up the best of modern civilization, they led the world for more than a thousand years, and left a heritage of good for all mankind coming after them, such as can be credited to no monarchy. The death of those that have gone out of existence was not, as is claimed by some, due to defects peculiar to the republican form of government. It came about naturally from the condition of things in the civilization of the earlier centuries. Men were warlike in those days, unrestrainedly contentious and regardless of the rights of others; public and private affairs were turbulent; class distinctions were sharply defined. Under such conditions all governments were, for the most part, short lived. Monarchies and oligarchies suffered as well as others. One after another they rose and disappeared, and none of them, until comparatively recent centuries, endured as long as the republics that were contemporary with them or that succeeded. The older republics deteriorated in public spirit toward the end; they were torn by internal dissensions; they became the prey of extravagance, dissolution and idle wealth within their borders, while jealous neighbors constantly sought to plunder and destroy or subjugate them. But these were dominant evils of the day in all lands and it stands to the credit of republican institutions that, despite disintegrating forces constantly at work, they existed long and splendidly. In modern times the story has been much the same. Only Great Britain, Germany, France, Italy, Austria, Denmark and two or three smaller monarchies can show results comparable with contemporary republics, and in those countries constitutions have given the people almost as much voice in public affairs as in a republic. Even in South America and Central America where government is still more or less chaotic and uncertain, the republics are in every way an improvement upon the despotic rule of Spain

that they succeeded. The first French republic was undisguised anarchy; the second was merely in comparison, a temporary flurry, but the third suffered in no wise with the most brilliant decades of the French kingdom or empire. The United States of America, under republican form of government, in all that goes to make up a great nation, has advanced to the forefront of world powers. Brazil has been as well governed in the decade and a half of its republican existence as it was even under the last Dom Pedro, most beneficent and most democratic of monarchs. The lesson to be drawn from the history of these republics from that of Israel to those of Cuba and Panama is that men are able to govern themselves well. The dangers and the evils that may threaten the republic have always been and are now the dangers and the evils inherent to the period, and threatening to any government, republican or otherwise. The elasticity of republicanism, permitting of easier adaptation to changing conditions and readier conformity to the needs of the people, gives it an advantage over the more rigid monarchy. That the general trend of the 19th century was toward republicanism cannot be questioned. Nearly half the republics that history tells of were started then and all of them are now in existence. The republican drift has been felt in other countries, as Spain, Portugal and Italy, for example, although it has there been overcome by hereditary authority. At the beginning of the 20th century more than one-half of the territory that is included in the civilized world belonged to republics and fully one-third of the population in all the civilized countries lived under republican rule.

Repu'diation, originally an American term, now used in all English-speaking countries, signifying the refusal of a national or state government to pay real or alleged pecuniary obligations. Nearly all leading countries have, at some time in their history, repudiated indebtedness. England has never repaid money borrowed for public uses from a Florentine merchant by one of the Edwards, and prominent London bankers were ruined when Charles II. confiscated their funds deposited in the royal exchequer. France redeemed the paper money called assignats at one thirtieth of its value. The United States failed to redeem the Continental currency. In the disastrous financial period of 1840 and several subsequent years, the States of Illinois, Indiana, Pennsylvania, Maryland, Mississippi, Michigan and Louisiana suspended payment of interest on their debts incurred in promoting public improvements, but all of them, except Michigan, Mississippi, and Louisiana, eventually fulfilled their obligations as to the capital of the debt. Governor McNut of Mississippi advocated "repudiating the sale of certain of the State bonds," on account of alleged fraud and illegality in the issue, and this was the origin of the term "repudiation" as applied to that course on the part of a State. The legislature of Mississippi refused to accept the governor's suggestion, but while the bonds were not formally repudiated, they were not redeemed. Michigan provided for the repayment of money actually received, repudiating obligations shown to have been issued without a fair equivalent, even

although in the hands of innocent parties. Louisiana paid her creditors in depreciated State bonds. Minnesota refused to honor certain railroad bonds guaranteed by the State, in 1858, claiming that the railroads had failed to comply with the conditions on which the guarantee was given. The question of paying this indebtedness was agitated for many years, and finally in 1880 Minnesota compromised by agreeing to pay 50 cents on the dollar.

After the Civil War the Southern States fell under the rule of unscrupulous white men known as "carpet-baggers," intruders from the North who took advantage of the prostrate condition of the Southern whites to obtain control of the State governments with the aid of ignorant negroes. In some instances, also, white natives of the South shared in the carnival of plunder and oppression. Obligations were issued for which no reasonable equivalent ever reached the State treasuries, and the impoverished communities, when the native whites obtained supremacy again, found themselves deeply in debt. Georgia, Virginia, North Carolina, South Carolina, Florida, Alabama, Mississippi, Louisiana, Arkansas, and Tennessee, either scaled their debts to a figure which represented value received, or refused to pay obligations alleged to be tainted with injustice and corruption. Under the 11th Amendment to the National Constitution States cannot be sued by individuals, and creditors are therefore powerless to attempt collection in the courts. The repudiated obligations of the Southern States are mostly locked up in Northern safes, being held by persons who hope that at some period in the future the States in question may follow the example of Minnesota, and decide, notwithstanding alleged fraud and illegality, to redeem the promises to which the State seal is affixed.

Spanish-American republics, with some honorable exceptions, have persistently ignored their financial obligations. An attempt by France, England, and Spain, to collect debts due by Mexico, was the cause, or more correctly the excuse, for the ill-fated effort to establish an empire in Mexico, with Maximilian on the throne. Since the growth of Mexico in prosperity and position among the nations, under the beneficent despotism of Diaz, the Mexican government has voluntarily taken steps to meet its financial obligations. Venezuela's indifference to foreign claims led to the blockade of Venezuelan ports in 1902-3 by Germany, Great Britain, and Italy, and The Hague Tribunal decided in February 1904 that the nations who took part in these warlike proceedings were entitled to preferential treatment in the settlement which Venezuela had agreed to make with all her creditors. This decision caused much dissatisfaction on the part of the United States government, as it was apprehended that it would encourage the collection of debts by European powers from the weaker American republics by violent methods.

Repulsion, in physics, the force which compels certain bodies or their particles to recede from each other. No repulsion exists between bodies at sensible distances, except when they are in certain electric or magnetic states, in which case the repulsions between them are in the inverse ratio of the square of the distance. At insensible distances, some influence keeps the

particles of a body from being in absolute contact, whence results the phenomenon of elasticity. The motions produced by heat are also a cause of strong molecular repulsion. The molecules of gases are always in a state of mutual repulsion.

Reputed Ownership, in law, is a phrase used of one who has to all appearances the right and actual possession of property. "The false credit raised by a person exercising all the rights of ownership over a subject not his own has led to the adoption of the rule that the creditors of the reputed owner may take the subject as if it were his own." See BANKRUPTCY.

Requeña, rā-kā'nā, Spain, town in the province of Valencia, 40 miles west of Valencia. The remains of the tower of the ancient church of San Salvador; the castle towering above Las Cabrillas (a prominent summit), and the ruins of walls which formerly surrounded the city, are the chief points of architectural interest. The chief industry consists in the culture of silk, saffron, grain, fruit, and wine. Pop. 14,500.

Reredos, rēr'dōs, in church architecture, usually the screen back of the altar, which is adorned with sculptured work comprising the tabernacle, niches, statuary, and the like; in some great cathedrals, for example, in England, the cathedrals of Durham, Winchester, and St. Albans, the reredos is a mass of most elaborate carving which reaches nearly to the graining.

Res Judicata, rēz joo-dī-kā'tā, a law term meaning that the subject matter of an action has been already decided by a court of competent jurisdiction. A matter so decided cannot again be made a ground of action between the same parties.

Resaca, rā-sā-kā, **Battle of**. While the armies of Gens. Thomas and Schofield were threatening an advance from the north on Dalton, Ga. (q.v.), Gen. Sherman ordered Gen. McPherson, commanding the Army of the Tennessee, to move southward through Snake Creek Gap and interpose between Dalton and Resaca. McPherson moved from Gordon's Springs 8 May 1864, his advance bivouacked that night in the Gap and next morning pushed through it, defeated a brigade of Confederate cavalry at the eastern end of it, and approached to within a mile of Resaca, on the Oostanaula, where he found the enemy in position too strong to be attacked; and being unable to find a good road by which he could quickly reach the railroad north of Resaca, and fearing an attack upon his own left flank, he prudently withdrew, after some severe skirmishing, and took a strong position near the east end of Snake Creek Gap. Sherman now resolved to transfer the greater part of his army to join McPherson. Howard's Fourth corps and a small force of cavalry were to demonstrate on Buzzard Roost Gap and occupy Confederate attention north of Dalton. On the 10th Hooker's Twentieth corps moved through Snake Creek Gap and joined McPherson. Palmer's Fourteenth corps and Schofield's Twenty-third corps followed, and on the 12th the whole army, except Howard's corps and the cavalry with it, was through the Gap. On the morning of the 13th McPherson, preceded by Gen. Kilpatrick's cavalry, led the advance on the direct road to Resaca. Thomas, with the corps of Palmer and Hooker, was to

RESACA DE LA PALMA—RESECTION

move on McPherson's left, and Schofield on the left of Thomas. The country was covered by dense forest, and the movement of troops was difficult. Kilpatrick drove the Confederate cavalry to within two miles of Resaca, and was wounded, and his cavalry wheeled out of the road, allowing McPherson to pass, who, encountering the Confederate pickets near Resaca, drove them in and occupied a range of bald hills, his right on the Oostanaula, about two miles below the railroad bridge, and his left abreast the town. Thomas came up on McPherson's left and faced Camp Creek. Schofield worked his way through dense forest and came up on the left of Thomas, but it was noon of the 14th when these movements were completed, at which time Howard's Fourth corps, following Johnston from Dalton, had reached a position about a mile north of Schofield's left. Johnston abandoned Dalton about midnight of the 12th, and during the 13th formed his army covering Resaca, Polk's and Hardee's corps west of the place, facing west and covering the railroad bridge and a trestle bridge. Polk rested his left on the Oostanaula, and Hood's corps, on the right of Hardee's, extended across the railroad to the Connesauga, facing to the northeast. Wheeler's cavalry was on the right, and Jackson's cavalry, on the left, guarded the Oostanaula from Resaca to Rome. There had been severe skirmishing on the afternoon of the 13th between the troops of McPherson and Polk, and it was renewed on the morning of the 14th, and in the afternoon McPherson carried a bridge on Camp Creek, crossed it, and secured a commanding position very close to Polk's main line and intrenched. Confederate efforts to retake the position were repulsed. Farther to the left Palmer's Fourteenth and Schofield's Twenty-third corps became severely engaged with Hardee on Camp Creek, parts of Schofield's corps were repulsed with great loss, another part succeeded in making a lodgment beyond the creek. Two divisions of Howard's corps, coming in from the north, were sent to Schofield's support, leaving Stanley's division in echelon to the left. Hooker's corps was sent to the left. Johnston had noted the exposed position of Sherman's left and ordered Hood, with the divisions of Stewart and Stevenson, to attack and turn it. Late in the afternoon Hood attacked Stanley, outflanked him, and was driving him back when the advance of Hooker's corps, Williams' division, came up, repulsed Hood and drove him back to his intrenchments. Skirmishing was resumed along the entire line on the morning of the 15th, and Sherman ordered an advance of Hooker on the left, and the two divisions of the Twenty-third corps were withdrawn from the centre and marched to the extreme left in support. It was after noon when Hooker advanced, Butterfield's and Geary's divisions on the right and centre, and Williams' on the left. Hood, with the divisions of Stevenson and Stewart, supported by three brigades from Polk's and Hardee's corps, made a simultaneous advance from his works. Stevenson on his left was struck first by Butterfield and then by Geary, before he had gone far from his works, and after a severe fight was driven back to them, leaving a four-gun battery in advance of his line, which remained between the two lines until night, when it was secured

by a detachment of Geary's division. On Hood's right Stewart's division swung to the left, drove Williams' skirmishers from the railroad and, crossing, assaulted Williams' main line most vigorously, but was bloodily repulsed and fell back to its intrenchments. A part of Schofield's corps on Hooker's left took part in this engagement. Hooker's loss was over 1,600. On the 14th Sherman had ordered a pontoon-bridge to be thrown across the Oostanaula at Lay's Ferry, in the direction of Calhoun, and Sweeny's division of the Sixteenth corps was ordered to cross it and threaten Calhoun. Sweeny crossed one brigade, drove some Confederate cavalry from the opposite bank, then hearing that the Confederates were crossing above him, he withdrew the brigade and retired his entire division half a mile to a less exposed position. On the morning of the 15th he moved back to the river and crossed it, laid a pontoon-bridge, and constructed works. Here he was fiercely attacked by Walker's Confederate division, which was repulsed. The presence of a part of Sherman's army east of the Oostanaula determined Johnston to retreat, and that night he abandoned Resaca and marched for Calhoun. Sherman occupied Resaca on the morning of the 16th and started in pursuit. The Union loss at Resaca was about 600 killed and 2,147 wounded. The Confederate loss was about 300 killed, 1,500 wounded, and 1,000 missing. Consult: 'Official Records,' Vol. XXXVIII.; Cox, 'Atlanta'; Van Horne, 'History of the Army of the Cumberland,' Vol. II.; Sherman, 'Personal Memoirs,' Vol. II.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.; Johnston, 'Narrative of Military Operations.'

E. A. CARMAN.

Resaca de la Palma, rā-sā'kă dā lā pāl'mā, Texas, a ravine in Cameron County; four miles north of Brownsville. On 9 May 1846, an engagement took place here between 2,300 Americans under General Taylor, and 5,000 Mexicans under General Arista. The Americans were victorious; their loss was 39 killed and 83 wounded. The Mexican loss was 200 killed, 228 wounded, and 100 missing. Consult: Howard, 'Life of General Taylor'; Bancroft, 'History of Mexico.'

Re'script, the term applied in Roman law to the answers of popes and emperors to questions in jurisprudence propounded to them officially. The rescripts of the Roman emperors constitute one of the authoritative sources of the civil law. These were usually addressed to the provincial magistrates, to corporations, or even to individuals. The rescripts of Justinian admitted into the code have acquired great authority. The rescripts of the popes concern principally theological matters.

Rescue, or **Schrader's Brome Grass**. See GRASSES IN THE UNITED STATES.

Resection, in surgery, the operation of cutting out the diseased bone of a joint. It frequently obviates the necessity of amputating the whole limb, and by the removal of the dead parts leaves the patient a limb which, though shortened, is in the majority of cases better than an artificial one. Resection, which is one of the triumphs of modern surgery, became a recognized form of surgical operation in 1850.

Reservation of the Eucharist, the keeping of the sacramental species against emergent occasions, as the communion of the sick in their homes, for the Mass of the Presanctified on Good Friday, for the rite called Benediction of the Blessed Sacrament, and for perpetual adoration. Mention is made in authors of the times immediately following the apostolic age, of the custom of bishops sending to one another the Eucharist in token of Christian union and fraternity. St. Ambrose (4th c.) tells of the Eucharist being carried by lay persons; in the Middle Ages this custom was still in vogue. Thomas à Becket carried the Eucharist with him when he went to meet Henry II. and Saint Louis carried the sacred species with him on his crusade. The sacred host is now customarily reserved in all Catholic churches whether of Latin or Oriental rite, being kept usually in the tabernacle of the high altar in the Latin Church, and in Greek churches in a special receptacle, *artophorion*, behind the altar: whenever it is reserved, a lamp is kept ever burning before it.

Reservation, Mental, in moral theology and ethics, the withholding from speech words that are necessary to convey the sense in which the speaker wishes his interlocutor to take his words: in general, Mental Reservation is the using of words in a sense other than that which is obvious and which the speaker knows they are likely to convey: this is commonly called equivocation. Is Mental Reservation or equivocation ever lawful? The obligation to speak truth is acknowledged by all moralists, Catholic and Protestant alike; all theologians agree in the cardinal doctrine that it is never lawful to lie. But, mental reservation or equivocation has the same effect as lying: can resort, then, be made to equivocation without sin? "Almost all authors," answers John Henry Newman (*Apologia*, Appendix.), "Catholic and Protestant, admit that *when a just cause is present*, there is some kind or other of *verbal misleading*, which is not sin." The Catholic casuist is bound by authoritative decisions of the Roman See to hold that equivocations and mental reservations that *cannot be perceived* by the hearer are forbidden by the law of God: but nearly all Catholic moralists teach that sometimes a mental reservation is lawful, which may be, though very likely will not be, understood from the circumstances: on this ground a priest may deny that he knows of a crime which he has learnt through sacramental confession. Newman mentions various modes of verbal misleading which have received the sanction of moralists: one is the straightforward way of saying the thing that is not, as when one gives false direction to one who intends murder; authors hold that veracity is a kind of justice, and therefore when we have no duty of justice to tell truth to another, it is no sin not to do so. Another defense of certain untruths resorted to for just cause is, that veracity is for the sake of society, and, if in no case we might lawfully mislead others, we should actually be doing society great harm. On the other hand, certain strict moralists hold that all equivocations are in their nature lies, and therefore under no circumstances may we without sin equivocate. And then there is the rough-and-ready way of dealing with lies, namely, that of admitting that on a great or cruel occasion a man cannot help telling a lie, and he would not be a man did he

not tell it. "This view cannot for a moment be defended," Newman remarks, "but, I suppose, it is very common."

Reservation, Papal, of Benefices, the taking of the bestowal of certain church benefices and dignities out of the hands of the local church rulers and the attribution to the Roman Pontiff of the right to confer the same; or, what amounts to the same thing, the requiring of bishops, chapters and other persons or ecclesiastical bodies possessing the right of conferring benefices, that in case of vacancies they should bestow such benefices on persons nominated by the Pope. One reason alleged in favor of this practice was that thus the several national churches were linked more closely by personal ties of gratitude and affection to the central see, and through it to each other; another was that thus the Supreme Pontiff was provided with the means of rewarding those who had labored meritoriously in the cause of the Holy See and the Church Catholic.

Reservations, Indian. When the settlers from Europe came to realize that the Indians had human rights, and ought not to be enslaved or exterminated, the rule was generally adopted of confining the tribes to reservations, both for their own protection from unprincipled whites, and for the security of the white population. New York, Massachusetts, Connecticut, Rhode Island and other States enforced this policy in the colonial period and after independence, and the United States government has carried it out from an early date. Southern tribes east of the Mississippi were removed to the Indian Territory, designated by solemn pledge of the National government as a permanent home for their race, and there some of the tribes have achieved a high degree of civilization, and gained considerable wealth. They are largely intermarried with whites, and to some extent with negroes, whom they formerly held as slaves. Other tribes, chiefly from the Southwest, have been gathered into the Indian Territory, but large Indian reservations, mainly of Sioux, are still maintained in the Northwest, and altogether the various tribal reservations in the different States and Territories number about 185. The reservations are carefully guarded against intrusion by unscrupulous whites, and provision is made for the intellectual and physical welfare of the Indians, and for leading them to adopt civilized methods of self support, instead of depending on the chase, which now offers only the most precarious returns, or on government aid, which, however, is not withdrawn under any circumstances while an Indian is in need of it. The sale of intoxicating liquor to Indians is severely punished when detected, but the law is frequently evaded.

Reserve, in military affairs, has several significations. In battle the reserve consists of those troops not in action, and destined to supply fresh forces as they are needed, to support those points which are shaken, and to be ready to act at decisive moments. Napoleon's guards, and his disposition of them, are models. They often decided the victory when the enemy felt sure of success. The reserve of ammunition is the supply of warlike stores placed close to the scene of action to allow of the supply actually in the field being speedily replenished.

The term reserves is also applied to those

forces which are liable to be called into the field on great emergencies, for the purposes of national defense; which have received a military training but follow the ordinary occupations of civil life, and do not form part of the standing army. Such reserves now form a part of all national troops organized on a great scale. The militia of the various States is practically a reserve force for the National Government in the event of war.

Reserved Cases, in the canon law of the Roman Catholic Church, certain sins the power of absolving from which is reserved to the ecclesiastical superior himself—the pope, the bishop, the ruler of a monastery or other religious house. The “faculties” conferred regularly on priests who administer the sacrament of Penance do not extend to reserved cases, and the penitent must sue personally or through an intermediary for absolution by the pope, bishop or other superior to whom the case is reserved. Bishops have the right to limit the absolving power of those who under them have cure of souls, but in the United States this right is seldom exercised, and the “faculties” accorded in this country to rectors of churches and other *confessarii* is practically as large as that possessed by the ordinaries themselves.

Reservoir, a receptacle for storing water for any purpose, but more commonly for supplying cities and towns, feeding canals, driving machinery, and the like. The construction of a reservoir is of much importance, and requires great engineering skill. In the selection of a site the great object should be to choose a position which will give the means for collecting a large supply of rainfall with as little recourse as possible to artificial constructions. An advantageous site would be, for instance, in the narrow gorge of a valley through which a stream passes, and at a place where the gorge widens out on the side looking toward the source of the stream. Particular care, however, is necessary to discover whether the position chosen communicates with the courses of underground waters or springs, as disastrous results have frequently been occasioned by ignoring this. As a general rule the best and safest method is to establish reservoirs in valleys filled in with clays derived from the decomposition of the primary formations, which are very slightly permeable. The embankments or dams may be constructed either of masonry or earth-work, the latter being generally the more economical method. Where the reservoir requires to be constructed on perfectly level ground the excavation should be calculated so as to equal the embankment. The earth-work of dams should be as much as possible of material—such as a mixture of clay and gravel—which would resist the infiltration of the water; but as it is impossible always to obtain such material in sufficient quantities, engineers have recourse to a device which consists in the construction of a kind of wall termed a *puddle-wall*, formed in the middle of the embankment. This wall is constructed of well-worked clay, the foundation of the puddle being a trench dug down to impervious rock or clay, and its breadth should be on an average about one third the height of the embankment. The inside slope of the embankment is usually 1 perpendicular to 3 horizontal, sometimes it is steeper; the outside slope is 1 perpendicular to 2 horizontal; and

the height above the surface of the water is 4 to 7 feet. The earth-work ought to be constructed of thin layers, carefully rammed so as to secure their equal settlement; the inner face requires to be protected by stones in order to resist the action of the water. The waste-weir, to admit of the surplus water flowing over, should be from 4 to 6 feet below the surface line of the embankment, built of strong masonry-work, and of a width such that with a flow of 2 feet over the crown it should be able to discharge all the water brought down by the severest floods ever known to fall upon the basin supplying the reservoir. Many of the accidents that have occurred were due to deficiencies in the waste-weirs. In the reservoirs of which the dams are built of masonry there is no necessity for a waste-weir, as then the water may be allowed to overflow the wall, there being no fear of its endangering the work. The outlet at the bottom, by which the water to be used is drawn off from the reservoir, may consist either of a tunnel, culvert, or iron pipes provided with suitable sluices, and these should be so constructed that access may be had to them even when the reservoir is full.

The true principles for the proportioning of masonry dams were not thoroughly investigated until about the middle of the 19th century and subsequently. This was first done by French engineers, and many such dams have since been constructed in France, Algeria, the United States, etc. The highest of all such dams is that of the New Croton reservoir, New York, its height being 248 feet; thickness at bottom, 185 feet; at top, 16. The first great masonry dam built in France on the newer principle was that of Furens (1860-5); height, 184 feet; thickness at bottom, 162; at top, 11. The San Mateo reservoir dam near San Francisco, is 170 feet high; thickness at bottom, 176; at top, 20. The Periyar dam, India (1890-5), has a height of 173 feet; bottom thickness, 139; top, 12. In the famous reservoir of Alicante, Spain, executed 1579-94, the wall is 67 feet thick at the top, 112 feet at the bottom, and the height 141 feet. In England the preference is generally given to earthen dams. Sometimes natural lakes are used as reservoirs, instances of which are Loch Katrine, for the water supply of Glasgow, and Lake Thirlmere, in Cumberland, for the supply of water to Manchester. Distributing reservoirs for towns are generally built of masonry, but are sometimes of iron. They ought to be placed high enough to command the highest part of the town, and ought to be capacious enough to contain half a day's supply, their chief use being to store the surplus water during the night. Among notable modern storage reservoirs for towns are those of the Vyrnwy, for supplying Liverpool, containing 11,900 million gallons; Vehar (10,800 million gallons), for Bombay; San Mateo (31,000 million gallons), for San Francisco; and the New Croton (32,000 million gallons), for New York.

Resht, *rësht*, Persia, capital of the province of Ghilan, 150 miles northwest of Teheran, near the Caspian Sea, and with a port at Enzeli. On the highway of commerce and travel between Europe and Persia, its geographical position has a special significance. There is an extensive manufacture and trade in silk. Pop. about 40,000.

RESIDENCE — RESISTANCE

Residence, the place which a man regards as his home, even although he may be absent from it for long periods of time. In the United States the question of residence is of the greatest importance, involving citizenship, the right to vote, marital relations, questions of taxation, and of the disposition of property by will or inheritance. It has therefore frequently engaged the attention of the courts, and the decisions have not been uniform. As a rule a man is assumed to reside where his family have their home, provided he is not separated from them by law, and provided they have not refused to accompany him to a fitting residence elsewhere. When a man has a summer and a winter home, the question of residence is usually determined by his personal declaration, and his payment of personal taxes in the place which he elects to call his residence. Courts regard with suspicion and disfavor change of residence for the obvious purpose of obtaining a divorce, and New York courts have refused in several instances to recognize divorces granted in States to which citizens of New York had removed in order to take advantage of liberal divorce laws. Altogether the question of residence is far from being governed by any settled decision, but honest intent as shown by a frank and open course of conduct is usually respected by courts of law in passing upon the issue. See also HOUSE.

Resin Weed. See COMPASS PLANT.

Resistance, Electrical, that property of electrical conductors in virtue of which the passage of a current of electricity through them is necessarily accompanied by the dissipation of a part of the energy in the form of heat. It is manifested not only in a linear conductor like a wire, but also in solids of large extent in two or three dimensions, as when a current passes from one point to another of a sheet of metal, or of a mass like an ingot or casting. It is chiefly in connection with wires, however, that electrical resistance is of practical impor-

tance. The energy of the moving current of water is gradually dissipated in the form of frictional heat, and the energy of the moving current of electricity is similarly dissipated on account of the electrical resistance of the conductor through which it is passing. The unit in terms of which resistance is measured is the "ohm," which may be taken as sensibly equal to the resistance of a column of mercury 106.3 centimetres long and one millimetre in cross-section, at the temperature of freezing water. (For a more exact statement on this point, see UNITS.) The phenomena of electrical resistance have been studied, both mathematically and experimentally, by many eminent physicists; but the most important contributions to our knowledge are due to Georg Simon Ohm (for whom the "ohm" was named), and to James Prescott Joule. Ohm investigated the manner in which the flow of electricity through a conductor depends upon the resistance of the conductor, while Joule determined the law that governs the dissipation of energy from a conductor, in the form of heat. In the following exposition of the laws of Ohm and Joule, it will be assumed that the currents in the conductors are steady, that the electro-motive forces in the circuits are constant, and that the conductors are stationary (so that their coefficients of induction remain constant). The laws may still be applied, though in a somewhat more generalized form, to conductors in which these three conditions are not fulfilled; but for the proper understanding of the phenomena in such cases, it is necessary to refer to the more advanced treatises on electricity.

One of the results of Ohm's investigation was, that in a branched circuit, in which the resistances of the two branches are precisely equal, the current divides in such a manner that exactly one half of it traverses each branch. By taking advantage of this fact, we can determine the resistance of a proposed conductor in the following manner: Let R , in Fig. 1, be the resistance to be measured, and let this be

FIG. 1.

tance, and it is only in this aspect that the subject will be here considered.

The passage of a current of electricity through a wire or rod has been likened to the flow of a current of water through a pipe, the water corresponding to the electricity, and the friction between the water and the pipe to the electrical resistance of the wire. The analogy is not perfect, but it is certainly very useful in forming a good conception of electrical resis-

placed in one of the branches of the circuit. In the other branch of the circuit is a standard column of mercury, whose cross-section is one square millimetre, and whose temperature is that of freezing water; the resistance of such a column being (as noted above) one ohm for (say) each 106 centimetres of its length. The mercury column is arranged so that the current enters it at the left hand end; and the current is led away from the mercury column again by

RESISTANCE

means of the movable wire P , whose point of contact with the mercury can be shifted to the right or left, at will. The measurement consists in moving the point P until the two galvanometers A and B , one in each branch of the circuit, show that the currents in the two branches are precisely equal. We then know that the resistances in the two branches are also equal. In preparing the engraving it has been assumed that the equality has been observed to subsist when that part of the mercury column which is included in the circuit is 159 centimetres long, and therefore has a resistance of 1.5 ohms. If the galvanometers and connecting wires are identical in both branches, it therefore follows that the resistance of the coil R is also 1.5 ohms. The method of measuring resistances here described is presented in order to illustrate the fundamental idea of electrical resistance. In the practical measurement of resistances a more refined method, presently to be described, is employed.

It is found that the electrical resistance of a linear conductor of uniform cross-section is proportional (1) directly to the length of the conductor, (2) inversely to the area of its cross-section, and (3) directly to a certain numerical factor characteristic of each material, and which is called the "specific resistance" of the material. The specific resistance of a given metal varies to a certain extent with the physical condition of the metal. The following values are for annealed specimens, except in the case of lead and zinc, where pressed or extruded metal is understood; and the resistance of mercury has been taken as unity in each case. The temperature is also assumed to be that of freezing water, in every instance.

SPECIFIC RESISTANCES OF METALS.

| | |
|----------------|--------|
| Mercury | 1.0000 |
| Silver | 0.0158 |
| Copper | 0.0168 |
| Gold | 0.0216 |
| Aluminum | 0.0306 |
| Zinc | 0.0592 |
| Platinum | 0.0952 |
| Iron | 0.1022 |
| Nickel | 0.1310 |
| Lead | 0.2063 |

In practice, mercury columns are not used as standards of resistance, because they are not convenient to manipulate. The mercury column is selected as defining the "ohm" for general purposes, because it is easy to obtain mercury in a state of purity, and also because all questions of internal stress and physical state in general are eliminated by the use of a fluid standard. An isolated observer, for example, who wishes to construct a resistance of one ohm for experimental purposes, can do so readily enough by preparing a column of pure mercury of known length and cross-section. He can then compute the resistance of this column, at the freezing point of water, and in this way he can obtain a standard of considerable accuracy. In practical work, however, it is customary to employ, as standards of resistance, coils of wire that are wound upon spools or bobbins. These are standardized either by comparison with other coils whose resistances are known, or by direct comparison with a mercury column of known dimensions and assured purity. A bobbin that is wound with wire as an ordinary

spool is wound with thread possesses a considerable coefficient of self-induction if the length of wire is at all great; and this tends to impair its efficiency as a standard, because in the practical measurement of resistance it is desirable to have the self-induction of the standard as small as possible. Standard resistance coils are therefore wound in a special way, with the idea of reducing the self-induction as much as possible. One half of the wire is wound about the central core (or spool) in one direction, and the other half is wound in the other direction; so that if an iron core were placed in the axis of the spool, and a current were sent through coil, the magnetic effect upon the central iron core would be zero. By this device, the self-induction of the coil may be rendered negligible.

The resistance of a conductor varies to some extent with temperature; and while the magnitude of the variation differs with different metals, and even with the physical state of any one metal, it may be taken, roughly, as increasing by about 0.21 of one per cent, for each Fahrenheit degree of rise of temperature, for copper and silver and several of the other pure metals. The resistance of liquid mercury increases much more slowly with temperature, the coefficient of mercury being only about one fifth of that stated above. The resistance of carbon diminishes as the temperature rises. In accurate electrical work it is evidently essential, in view of the variation of resistance with temperature, either to keep the temperature of the standard coils constant, or to ascertain the coefficient of variation of resistance with temperature with considerable care, so that a suitable correction may be applied for any departure of the temperature of the standard coils from the one temperature at which their resistances are accurately known. In practice it is usual to determine the temperature coefficient with as much accuracy as possible, and then to keep the temperature of the coil as near as practicable to the temperature at which it has been standardized. Any error in the determination of the temperature coefficient will then have but small effect upon the calculated resistance of the standard. Many attempts have been made to prepare alloys which shall have negligible temperature coefficients; and while no alloy has been found whose electrical resistance is absolutely independent of the temperature, several have been prepared whose temperature coefficients are quite small. German silver is one of the commonest of these alloys, the composition of that which is used in the preparation of resistance wire being (by weight) 4 parts of copper, 2 of nickel, and 1 of zinc. The specific resistance of this alloy is about 13 times that of copper, and its temperature coefficient is only about 0.022 of one per cent, per degree Fahrenheit. "Platinum-silver," as used for electrical resistance standards, is composed of two parts (by weight) of platinum, to one part of silver. It has a specific resistance about 15 times as great as that of copper, and its temperature coefficient, per Fahrenheit degree, is only about 0.017 of one per cent. "Manganin" has largely come into favor for electrical resistance standards during the past few years, the composition recommended by the Reichsanstalt being (by weight) 84 per cent of copper, 12

RESISTANCE

per cent of manganese, and 4 per cent of nickel. Its specific resistance is about 20 times that of copper, and its temperature coefficient is only about 0.0013 of one per cent, per Fahrenheit degree, at ordinary temperatures; the coefficient diminishing as the temperature rises, until, at about 113° F., the coefficient becomes rigorously zero. At still higher temperatures, the coefficient of manganin becomes negative; but at all temperatures it is so small that it can be neglected for all purposes save those in which the highest attainable degree of accuracy is required.

In the accurate measurement of electrical resistances, the device known as "Wheatstone's bridge" is employed. Ohm's law, which is one of the most fundamental principles in the science of electricity, states that in any circuit of constant form, in which a constant electromotive force is acting and a uniform current is flowing, the current, resistance and electromotive force are connected by a simple mathematical relation, which may be expressed in the following manner: Let any two points in the circuit be selected, and let R be the resistance included between these points, as expressed in ohms. Let E be the electromotive force between these same points, as expressed in volts; and let C be the current between them, in amperes. Then the

relation in question is $C = \frac{E}{R}$, or $E = CR$.

To apply this principle to the measurement of resistances, let A and B , in Fig. 2, be the two

FIG. 2.

points selected, and let the circuit be divided at these points, into the two branches AHB and AKB ; the resistance of AH being P , while that of HB is Q , that of AK is S , and that of KB is T . The points H and K are to be connected, later, by means of a conductor, HGK , carrying a galvanometer, G ; but for the moment the conductor HGK is assumed to be non-existent. Let us suppose that the difference in electromotive force between A and B is E , while that between A and H is e . Then Ohm's law, when applied to the branch AHB as a whole, gives $E = C_1(P + Q)$; C_1 being the current flowing through the branch AHB . Similarly, when applied to the section extending simply from A to H , Ohm's law gives $e = C_1P$. Eliminating C_1 from these two equations, we find that e , the electromotive force between the two points A and H , is equal to $EP/(P + Q)$. In the same way we may show that the difference of electromotive force between A and K in the branch AKB is equal to $ES/(S + T)$. If the electromotive force between H and K is zero, then these two expressions are equal, and we have $P/(P + Q) = S/(S + T)$, which is equivalent to $Q/P = T/S$, or to $PT = QS$. If H and K are connected by a branch con-

ductor that includes a delicate galvanometer, G , then the galvanometer will indicate a current except when the electromotive force between H and K is zero; that is, it will show a current whenever the relation $PT = QS$ is not fulfilled. This arrangement of branch circuits, with a galvanometer bridging across from one of the branches to the other, constitutes "Wheatstone's bridge." Its use for measuring resistances may be illustrated as follows: Let Q and T be two known resistances, and let P be the unknown resistance, whose value is to be determined. At S we introduce a "resistance box," which is merely a box containing an assortment of known resistances, so arranged that any or all of them can be conveniently thrown into the circuit or out of it. The resistance S is varied by trial until the galvanometer G ceases to show a deflection; and when this condition is fulfilled, we know that the equation $PT = QS$ holds true. But we knew Q and T to start with, and we have determined S by trial; so that we know three of the four resistances that enter the foregoing equation, and we can therefore calculate the fourth. Resistances may be determined, in this manner, with exceeding accuracy. (Consult, for full details, W. A. Price, 'Treatise on the Measurement of Electrical Resistance'.)

One practical application of Ohm's law relates to the arrangement of the cells of a battery, so that the current goes through all of the obtained in a given circuit, by the use of a fixed number of cells. If the zinc electrode of one cell is joined to the carbon electrode of another, a compound element is thereby formed, which has twice the electromotive force of a single cell, and whose internal resistance is also twice as great as the resistance of one cell. Similarly, if n cells be arranged in series, so that the carbon of each is connected to the zinc of the next, and so that the current goes through all of the cells consecutively, the electromotive force of the battery will be nE (where E is the electromotive force of one cell), and the resistance of the battery will be nr (where r is the resistance of one cell). If the terminals of this battery be connected by means of a wire whose resistance is R , the total resistance of the circuit so formed will be $R + nr$; and hence the current through the circuit will be (in accordance with Ohm's law)

$$\text{Current} = \frac{nE}{R + nr}$$

If R , the resistance of the external part of the circuit, is very small, it is evident that the current will not be very different from E/r ; that is, if the external resistance is very small, the current sent through it by the battery of n cells arranged in series, will not be greatly different from the current that would be obtained by the use of a single cell. But if R is very large, so that nr is negligible in comparison with R , then the current through the external circuit becomes sensibly equal to nE/R , which is approximately n times as great as the current that a single cell would send through the given external circuit. When the resistance of the external circuit is great, therefore, the maximum current is obtained by arranging the cells of the battery in "series," as described above.

If the n cells are arranged so that all of

the carbons are connected together to form one electrode, and all the zincs are connected together to form the other one, then the electromotive force of the battery is the same as that of a single cell. That is, it is r/n . The external internal resistance of n cells arranged in this way, however, is only one n th of the resistance of a single cell. That is it is r/n . The external resistance being R , as before, the total resistance of the circuit is $R + r/n$, and hence the current in the external circuit is

$$\text{Current} = \frac{E}{R + r/n}$$

If the external resistance, R , is large, then r/n will be negligible, and the current becomes practically E/R , which is approximately equal to the current that a single cell would send through the same large external resistance, R . On the other hand, if the external resistance, R , is very small, R may be negligible with respect to r/n , and in that case the current through the external resistance becomes nE/r , which is sensibly n times as great as the current that a single cell of the battery would send through a very small external resistance. When the resistance of the external circuit is very small, therefore, the maximum current through it is obtained by arranging the cells of the battery "in parallel"; —that is, so that all of their carbons are connected to form one positive electrode, and all their zincs are connected so as to form one negative electrode. In general, it may be shown that the maximum current that any given battery can produce through a given conductor, is realized when the cells are so arranged that the effective internal resistance of the battery is as nearly equal as possible to the external resistance through which the current is to be sent.

The quantity of energy dissipated in the form of heat when a current traverses a conducting circuit was investigated by Joule, and also by Lenz, Becquerel, and others. It is found that the quantity of heat-energy set free in any given conductor in one second is proportional (1) to the resistance of the conductor, and (2) to the square of the current that is flowing. If the resistance of the conductor is R ohms, and the current is C amperes, then the quantity of heat generated in T seconds will be $0.238 C^2 R T$ calories; the "calorie" being defined as the quantity of heat required to raise the temperature of one gramme of water from 14°C . to 15°C . This is often called "Joule's law."

Resolution Island, the name of several islands, the principal one being in British North America, at the extreme end of Hudson Strait; lat. $61^\circ 39' \text{N}$.; long. 65°W . The island is about 40 miles in length and breadth, and Cape Resolution is on the east side. Resolution Island, in Dangerous Archipelago, Pacific Ocean, is in lat $17^\circ 22' \text{S}$., long. $141^\circ 35' \text{W}$. Resolution, a lagoon island in Low Archipelago, is in lat. $17^\circ 25' \text{S}$., long. $143^\circ 24' \text{W}$.

Resolu'tioners, a designation of party which had its origin in Scotch church history. When the Scotch with their covenant king, Charles Stuart (Charles II.) had been defeated by Cromwell at Dunbar (13 Sept. 1650), the

Scotch parliament repealed an act under which royalists were excluded from the army. The repealing act was approved by a large majority of the Scotch Kirk as being wise and politic in the circumstances, but it was reprobated by a small but zealous minority in the Kirk as a betrayal of the true interests of religion; this party was known as that of the Protestors, the other party as that of the Resolutioners; each of the two maintained that it was itself the genuine Scotch Kirk, the only church that remained faithful to the Covenant and to the church's head, Christ.

Resolutions of '98, the designation commonly given to the Kentucky and Virginia resolutions of 1798, defining the relations between the State and Federal governments, and protesting against certain acts of Congress as unconstitutional, and as violating the rights reserved to the States. The Resolutions offered in the Kentucky legislature, and adopted by that body, were drafted by Thomas Jefferson, who, in common with other leading American statesmen, and the majority of the people, was alarmed by the enactment of the Alien and Sedition Laws, and other measures regarded as indicating a purpose to create a centralized despotism in place of the Union formed under the Constitution.

The first Resolution declared that the Federal Constitution was a compact between the States, by which a general government was created for special purposes, and that, "as in other cases of compact between parties having no common judge, each party has an equal right to judge for itself, as well of infractions as of the mode and measure of redress." The Alien and Sedition and other laws were pronounced "not law, but altogether void and of no force," and one of the Resolutions postponed to "a time of greater tranquillity" the "revisal and correction" of other acts of Congress alleged to be unconstitutional.

The eighth Resolution directed the appointment of a committee of correspondence, to communicate the Resolutions to the several States, and to inform them that the State of Kentucky was determined "to submit to undelegated and consequently unlimited powers in no man or body of men on earth; that in the case of an abuse of the delegated powers, the members of the general government being chosen by the people, a change by the people would be the constitutional remedy; but when powers are assumed which have not been delegated, a nullification of the act is the right remedy; and that every State has a natural right, in cases not within the compact, to nullify of their own authority all assumptions of power by others within their limits." The Committee of Correspondence was instructed to request the other States "to concur in declaring those acts void and of no force, and each to take measures of its own for providing that neither these acts, nor any other of the general government, not plainly and intentionally authorized by the Constitution, shall be exercised within their respective territories."

The Resolutions passed the Kentucky legislature, 14 Nov. 1798, with only two or three dissenting votes, and similar Resolutions, drafted by James Madison, were adopted by the Virginia legislature, 24 Dec. 1798, by a vote of 100 to 63

in the House of Delegates, and 14 to 3 in the Senate. The fact that both Jefferson and Madison were afterward elected Presidents of the United States, and that the Democratic party, which they represented, remained in power for many years, has been accepted as indicating that the Kentucky and Virginia Resolutions had the substantial approval of the American people. See UNITED STATES.

Res'onance, a strengthening of sound. When a person speaks in an empty room the walls reflect the words. There is an echo from each wall; and when the person is not equidistant from the different reflecting surfaces the echoes strengthen one another, and strengthen the sound. Resonance includes such strengthening of sound as occurs when a sounding-board is used to strengthen the note from a string or the note of a tuning-fork, or when the air contained in an open-mouthed vessel is made to vibrate and strengthen a particular note.

Resorcin, or **Resorcinol**, a chemical substance having the formula $C_6H_4(OH)_2$, and therefore belonging to the group of phenols (q.v.). It may be regarded as derived from benzene, C_6H_6 , by replacing two of the hydrogen atoms by two hydroxyl radicals. Three substitution compounds of this character are possible (see AROMATIC COMPOUNDS), and all three are actually known. Catechol (or pyrocatechin) is the "ortho" di-substitution product; resorcin is the "meta" di-substitution product, and quinol (or hydroquinone) is the "para" di-substitution product. Resorcin was first prepared by Hlasiwetz and Barth, in 1864, by fusing galbanum resin with caustic potash. It is now prepared commercially by fusing caustic soda with the sodium salt of benzene-meta-disulphonic acid; this acid being itself prepared by the action of fuming sulphuric acid upon benzene. The resorcin that is formed is abstracted from the solution so obtained by agitation with ether, or with some other substance in which the resorcin is soluble, but which does not itself mix with water; and after isolation in this manner, the resorcin is purified by distillation or otherwise. Resorcin is soluble in water, in alcohol, in benzene, and in ether, and is insoluble in carbon disulphide and in chloroform. From water, alcohol and ether it crystallizes in trimetric tablets, and from benzene it is obtained in the form of needles. Pure resorcin is colorless, but upon exposure to the air it becomes reddish. It melts at $244^\circ F.$, and boils at about $520^\circ F.$ Resorcin, like ordinary phenol (or carbolic acid), is largely used in the manufacture of the coal tar colors (q.v.), and it is also used extensively in medicine. It has marked antiseptic properties, and is used in the treatment of skin diseases in washes, ointments and salves. It is also administered internally, though less commonly.

Respiration. The essential process in respiration is the taking in of oxygen and the giving out of carbon dioxide by the living cells of a plant or animal. In higher animals special organs, the lungs (q.v.), and a special tissue, the blood (q.v.), are the main factors in this exchange; but in the lower animals lungs are not necessary, and in plants, as well as in many of the lower animals, there is no true blood. Even in those higher animals in which the major

part of the oxygen exchange takes place in the lungs (external respiration), there is also an internal respiration constantly taking place in the exchange between the blood, the lymph, and other tissues. Respiration in plants is of the same general character as in animals. It is not to be confounded with the much more active process of photosynthesis, by which plants utilize carbon dioxide and give off oxygen, a process which was termed respiration by the older plant physiologists.

Historical Summary.—The earliest naturalists and philosophers, Aristotle and others, even down to the anatomists of the 15th century, taught that the function of respiration was to draw air into the arteries and heart, and thus to cool the blood. The old Galenic doctrine was that the "air introduced by breathing served to regulate, to maintain, and at the same time to temper, to refrigerate the innate heat of the heart." Again the pumping action of the thorax introduced into the blood the air which was necessary to generate the vital spirits in the left side of the heart, and finally the same pumping action got rid of the foul vapors, the product of the innate fire burning in the heart. Harvey was one of the first to show that the same channel probably did not serve to carry these two different currents. But the chemical problems involved were too intricate for Harvey, although it was chiefly through the work of a group of Englishmen of the 17th century that the unraveling of the mystery of respiration came about. Von Helmont had taught a theory of fermentations, and he had noted the difference in color in blood passing through the lungs. Borelli approached the mechanical side of the problem and showed the truth regarding the mechanics of the chest, the bellows-like action of which took in by atmospheric pressure and expelled the air by the muscular relaxation and the elasticity of the chest-walls. Malpighi had in the meantime discovered, with the aid of his crude microscopes, the minute structure of the lung, and Borelli, as well as others (Hooke, 1667; Croon and Boyle, 1666), working with the newly discovered principle of the air-pump and vacuum, had learned that air was absolutely essential to the life of the animal, and had advanced to the point that the particles of the air taken into the lungs enter into and become mixed with the blood. But Borelli was a physicist, and had no sympathy with the new chemical learning, which was then a very vague subject. Hooke and Lower made the next steps possible, the former by his artificial-respiration experiments, proving the necessity for air, and the latter by his careful transfusion experiments, demonstrating that the difference between dark venous blood and lighter arterial blood was due to the admixture of air, thus explaining this color change, which had been recorded for thousands of years and referred to thousands of causes. Up to this time it had always been thought that the air was a simple substance, and not a mixture. John Mayow (1643) first showed that not all of the air was used by the lungs in influencing the blood, but only a certain part; and although he called it by a different name (nitro-aerial gas), it was that part now known as oxygen. Mayow thus developed the first full adequate physico-chemical theory of respiration. He saw that respira-

RESPIRATION

tion was a process analogous to combustion, and that the movements were to take in the nitro-aerial gas and give out the vapors arising from the blood. But he did not know at all what these vapors were. He had grasped at the meaning of the intake, but had no knowledge of the exchange products. This and other wonderful discoveries were made by a young man of 25, and who died at the age of 34. Mayow's work was then forgotten for almost 100 years. As Foster expresses it, "that which in the first years of the latter half of the 17th century as igneo-aerial particles shone out in a flash and then died away again into darkness, in the last years of the 18th century, as oxygen, lit a light which has burned, and which has lighted the world with increasing steadiness up to the present day." The names of Stahl, Haller, Boerhaave appear as keeping alive the study of respiration. Stephen Hales, an active parish priest, and the earliest sanitarian, was an ardent student of chemistry. He first enunciated the principle of free and combined gases, and led the way to the work of Joseph Black, who rediscovered Von Helmont's "fixed air," which was given off by the lungs, and that animals placed in the "fixed air" died much as if they were deprived of fresh air. The next step was made by Priestley, who in 1772 rediscovered Mayow's "igneo-aerial" spirit and isolated oxygen. Priestley's views, however, were permeated by the century-old phlogiston theory, and it remained for Lavoisier clearly to demonstrate what oxygen really was and to overthrow the phlogiston theory. Thus the problem of animal respiration was solved. The air, composed mostly of innocuous nitrogen and of small proportions of active oxygen, passes into the fine air vesicles, first seen by Malpighi, the blood there takes up the free oxygen, giving off carbon dioxide, which exchange constitutes the essential feature of respiration. It should be added that it was not until Gustavus Magnus (1837) proved the presence of the blood-gases in different proportions in the blood that the present theory of respiration assumed a definite form. The study of the relation of the iron of the hæmoglobin in the blood to this oxygen exchange constitutes the last chapter in the unraveling of this secret of nature.

Mechanics of Respiration.—Breathing consists in the rhythmical expansion and contraction of the walls of the chest, by means of which process air passes into the lungs and thus comes in contact with the blood. The lung structure itself possesses no marked expansile power, but it is in a constant state of tension, there being negative pressure in the pleural cavity. The muscles attached to the ribs, including the diaphragm (q.v.), expand the cavity of the chest in all three diameters by raising the ribs and lowering the diaphragm; the air rushes in and inflates the lungs; the muscles then relax, the elasticity of the ribs causes the chest-wall to contract, the lungs themselves contract somewhat and the air is forced out through the bronchi and larynx. Thus it is evident that the lungs themselves are merely passive agents in inspiration, being filled and emptied of air largely in consequence of the movements of the chest-wall. The control of the muscular movements is partly voluntary and partly involuntary, and the breathing centre so called is in reality a

complex one, or rather a series of centres, all co-ordinated. Thus the motor centres for certain muscles attached to the ribs are located in the spinal cord, and their excitation can bring about restricted movements of expansion, while their destruction may result in paralysis of certain of the muscles of respiration. Another breathing centre, the most important one, spoken of as the automatic or true respiratory centre, is found in certain ganglion cells in the floor of the fourth ventricle of the medulla oblongata (q.v.). Their destruction destroys the co-ordination of the muscular movements, and brings about death. A third centre is present in some portion of the fore brain, probably in the frontal lobes. It is this centre that enables one to "hold the breath," or to make extra deep breaths, etc. The distinction between conscious and unconscious breathing is very distinct and yet very subtle. Voluntary influences constantly modify the rate of breathing. While one is asleep these conscious influences are usually temporarily excluded, and then the so-called normal rhythm is seen. This is usually from 18 to 20 to the minute in the adult, the ratio of length of inspiration to that of expiration being about 10 to 12. Numerous individual variations may be present, however, the rate varying from infancy to old age, and in diseased conditions the rate is nearly always modified, usually quickened in consequence of the increased oxidation that often accompanies disease. Occasionally respiration is slowed when there is painful breathing, or some form of poisoning; opium-poisoning is a noted illustration. In this condition the breathing rhythm may sink as low as 4 to 5 to the minute. In children of both sexes the movement of breathing are similar, but as adult conditions develop, and changes in dress become pronounced, it happens that women are more apt to breathe more in the chest (costal breathing), while men make more use of the lower ribs and the diaphragm (diaphragmatic or abdominal breathing). The amount of air taken into the lungs varies widely with the size of the individual, the shape of his chest, and a number of other factors that make it impossible to give a general average. It is usual to measure that portion of air that passes in and out of the lungs during normal respiration as tidal air; this has been known to be from 150 to 700 cubic centimetres. In forced breathing a certain extra amount of complemental air can be taken into the chest; its average being about 1,500 cubic centimetres. A certain amount of air (residual air) cannot be expelled from the chest even by forced expiration. This has been found to vary in amount from 400 to 1,500 cubic centimetres. The vital capacity, or the amount of air which can be expelled from the thorax by forced expiration following a deep inspiration—a spirometer, or the "lung-tester" of the circus, being the instrument for measuring the same—varies very widely according to practice, height, weight, and age. For the comparative anatomy of respiration, see ANATOMY, COMPARATIVE, *Respiratory System*.

Artificial Respiration.—When death is imminent, owing to a cessation of the natural respiration movements, it may sometimes be averted by an imitation of them carried on regularly for a while. Such a condition may occur in disease (for example, asthma, epilepsy), though very rarely; it is most common in suffocation, either

by drowning, choking, or strangulation, and is sometimes met with also in poisoning by noxious vapors (for example, carbonic acid, carbonic oxide, coal-gas, chloroform, etc.). In order that any method may have a chance of being successful it is of course necessary that the entrance of air into the lungs be not impeded, whether by a piece of food or by water in the windpipe, or by the tongue falling back and closing the upper opening. A piece of food may sometimes be removed through the mouth by the finger; if this fails, the windpipe should be opened. In those apparently drowned the body should first be laid on the face, with the head low, and the thorax and abdomen be pressed on in order to expel fluids which may have been drawn into the trachea and bronchial tubes. The tongue may need to be held forward; this may be done by an assistant; or an elastic band passed round the tongue and the chin will effect the object. No general consensus of opinion has yet been arrived at as to which is the best method of producing artificial respiration. The methods most employed fall into three divisions: (1) insufflation, or blowing of air into the lungs, either by the mouth or by means of bellows; (2) manual methods, in which external manipulations of the chest-walls are made to effect the entrance and exit of air; (3) electrical stimulation of the respiratory muscles. In all cases where artificial respiration is required every moment is of importance. It is doubtful whether life can ever be restored when the heart has ceased to beat for more than a few seconds; and when breathing has stopped failure of the heart's action is always imminent. That method is therefore best which can be applied with the least possible loss of time, so that under ordinary circumstances the methods which require bellows or electric batteries are out of the question. Direct insufflation, or blowing of air into the patient's lungs by the mouth applied to his mouth, is now hardly ever used except in the case of very young children, although within recent years specially devised pumps have been made that are at times very serviceable. Of the manual methods those most in use are Marshall Hall's (1856), Silvester's (1857), and Howard's (1877). The second is certainly the most easy to learn, but is more fatiguing to carry out for a length of time than either of the others. In Marshall Hall's method the body is laid upon its face and rolled "in what may be termed cradle-fashion" from this position on to one side and a little beyond it (inspiration), and then back on to the face (expiration). In Silvester's method the patient is laid on his back on a plane, inclined a little from the feet upward, and the shoulders are gently raised by a firm cushion placed under them, which also throws the head back. The operator then grasps the patient's arms just above the elbows, and raises them till they nearly meet above the head. This action imitates inspiration. The patient's arms are then turned down, and firmly pressed for a moment against the sides of the chest. A deep expiration is thus imitated. In Howard's method the patient is laid on his back with a cushion below the middle. The operator kneels astride his hips, places his hands with fingers spread outward over the lower part of the chest-wall, and alternately bends forward, throwing his weight on the chest to imitate expiration, and

springs back to allow the elastic recoil of the chest-wall to imitate inspiration.

Whatever method be adopted, the movements must be gentle, regular, and perseveringly carried on, at the rate of from 10 to 15 times in the minute; and when the faintest natural effort at respiration is observed they must at once be timed so as to reinforce and not to oppose it. In some cases life has been restored under artificial respiration when no respiratory movements have occurred for an hour or even several hours. In all cases, but especially in that of persons apparently drowned, artificial respiration should be conducted in a warm atmosphere, 90° F., or even more if possible, and should be supplemented by warmth applied to the body and by vigorous friction. In those apparently drowned recovery is very rare after complete immersion for as much as five minutes. If stunning or fainting has occurred at the moment of immersion, so that the respiratory movements have been annulled or much diminished for the time, less water will have entered the lungs, and the chance of recovery may be greater. In other modes of death by suffocation, such as choking or strangulation, the action of the heart may continue longer, and restoration to life be therefore possible after a longer deprivation of air. See ASPHYXIA; DROWNING.

Consult: Bert, 'Leçons sur la Physiologie comp. de la Respiration' (1870); Foster, 'Lectures on the History of Physiology' (1901); Schäfer, 'Text-Book of Physiology' (1901). See ANATOMY; HEMOGLOBIN.

SMITH ELY JELLIFFE, M.D.,

Editor 'Journal of Nervous and Mental Disease.'

Respirator, an instrument used as a mouth-covering to give warmth to the air inhaled into the lungs. They are also frequently employed to secure the inhalation of a medicated atmosphere, containing a layer of lint or wool on which a few drops of terebene, eucalyptol, or other antiseptic are placed.

Responden'tia, a term now seldom used, but meaning a loan raised by the master of a ship, when he has no other means of doing so, upon security of the cargo or goods on board the ship. The contract has reference to a particular voyage, and the conditions are that if the subject on which the money is advanced be lost by sea, risk, or superior force of the enemy, the lender shall lose his money; and that if the goods arrive in safety the loan shall be repaid with a greater than ordinary rate of interest, called marine interest. When the ship itself is hypothecated the contract is called bottomry. As a matter of fact the expression bottomry is employed, whether the vessel or her cargo or both be the security.

Ressel, řēs'sěl, **Joseph**, Austrian inventor: b. Chrudim, Bohemia, 29 June 1793; d. Laibach, Austria, 10 Oct. 1857. He was educated at Vienna and at Mariabrunn, and from 1817 until his death was employed in the Austrian Department of Forestry. He was skilled in mechanics and invented several machines. His claim to the invention of the screw-propeller seems as well founded as those of Ericsson, Sauvage, Smith, and Wilson, but owing to an accident on the trial trip of his invention he failed to secure a patent. Consult Reitlinger, 'Joseph Ressel' (1863).

Rest-cure, a method of treatment advocated by Dr. S. Weir Mitchell in 1875 for cases of nervous prostration and various conditions characterized by poor blood, and lack of muscular and nervous tone. It is a systematic treatment extending over several weeks, a combination of absolute rest of body and mind, regular diet at fixed hours, a separation from relatives and friends, passive exercise by massage, the use of electricity, and the supervision of a trained nurse. The use of medicines is of secondary importance, but frequently of value. As Dr. Mitchell puts it, the rest-cure is of service to "invalids, unable to attend to the duties of life, and sources alike of discomfort to themselves and anxiety to others." Consult Mitchell, 'Fat and Blood' (1877).

Res'tarick, Henry Bond, American Protestant Episcopal bishop: b. Somersetshire, England, 26 Dec. 1854. He studied at the King James collegiate school in Bridgewater, England, and after coming to this country was graduated from Griswold College, Davenport, Iowa. He took priest's orders in the Episcopal Church in 1882, was rector of St. Paul's Church, San Diego, Cal., 1882-1902, and in July of the last named year was consecrated the first American bishop of Honolulu. He has published 'The Love of God'; 'Addresses on the Seven Last Words.'

Restigouche, rēs-tī-goosh', a river of Canada, in its lower course separating New Brunswick from the province of Quebec, and flowing northeast into the Bay of Chaleur at Dalhousie. It rises in eastern Quebec, is 225 miles long, is navigable for 16 miles to Campbellton, and forms a tidal estuary for 24 miles. It drains 6,000 square miles, and its basin supplies great quantities of timber.

Restitu'tionists, a Christian religious sect in New England whose distinguishing tenet is that the restoration of mankind to the condition from which he lapsed through Adam's sin of disobedience is near at hand, and that the reign of perfect love, justice, purity, and holiness is soon to commence. They observe the Sabbath of the Hebrews as a holy day of rest and assemble weekly for worship on the evening (Friday) before the Sabbath.

Restoration, in matters of fine art, the putting of a building, a work of sculpture, a painting or other work of art into what is thought to have been its original perfect condition. There is, however, a secondary meaning which is often used in a way to cause confusion: this is the preparation of drawings showing what, in the opinion of the draughtsman or his director, would be the appearance of the building or other work of art if restored according to the above definition. The term "conjectural restoration" is applied to these drawings, though all restoration is more or less conjectural, but the adjective is used in these cases because the drawings often represent much more complete and precise, and much less thoroughly verified statements concerning the original state of the work of art than those which are actually carried out.

To treat first of these suggestions for restoration embodied in drawings: Among the most useful in the way of architecture are some by Sibil, who continued the work of Letarouilly in his folio work on the Vatican in Rome, and

those by the well-known author and architect, Viollet-le-Duc, especially in the plates to 'Entretiens sur l'Architecture,' and in three or four large lithographs for display on the walls of schools and the like. These are based upon a very exact knowledge of the processes of building. There are some of singular interest in the work on the discoveries at Pergamon, by Pontremoli and Collignon ('Pergame,' Paris, 1900); in the kindred work on 'Epidauros' by Defrasse and Lechat, Paris, 1895; also in a three-volume book called 'La Restauration d'Olympie' by Laloux and Monceaux. In such drawings a building will be shown complete and in use, with figures near it and passing up and down its flights of steps, or seated on its stone benches. Life is given to the representation by landscapes fitted to the purpose, or by other carefully considered surroundings. In connection with these there should be mentioned also the models in plaster, the preparation of which is a serious art in Paris and in other great centres of artistic study. These models, when concerned with a non-existent building, may be a complete rendering of that building, as in the case of the model of the Parthenon and that of the Hypostyle Hall at Karnak, both at the Metropolitan Museum of Art, New York. In these there has been a bold attempt to show, as if definitely known, the entirely uncertain structure of the roof of the great temple, and also the painting on the same building, according to the theory of the accomplished architect who designed the model, the late Charles Chipiez: but the Egyptian temple has its paintings modified on account of modern notions of propriety. The model of the Pantheon at Rome, in the same collection, can be visited both within and without, and is more nearly trustworthy than that of the Parthenon. All of this, however, is conjectural restoration of excellent quality.

Restoration of buildings, when carried out in reality, is extremely open to error of the most mischievous sort, because it is never safe to assume that the last word has been spoken in the matter of demonstration of the building's original condition. We, in 1904, cannot for a moment accept the archaeological knowledge of our predecessors of 1860, and yet in the years following the middle of the 19th century nearly all the most important mediæval buildings of Europe were restored, and too often in a radical way. In too many cases the original character of the building is destroyed altogether, as in the famous instance of the Church of Saint Front at Périgueux, and in the case of the Fondaco dei Turchi at Venice, now the Museo Civico; but in a vastly greater number of cases the restoration has been conscientious and in a way judicious, but has still destroyed much that would be, had it been spared, the best possible evidence for the original study of the structure. It will be noted that the ambition of the official or committee in charge of a great building, religious or secular, is nearly always to have it as complete and elegant as may be; that this ambition is more than repeated in the architect whose reputation and pecuniary gain are closely connected with the great and costly undertaking; and finally that these ambitions find an echo in the opinions of the general public, who, of course, like to see the famous monument of their city put

into first-rate order and kept as clean and perfect and bright-colored as the new buildings near. To this is added the actual demand for safety. Thus, in the case of the Ducal Palace at Venice, of which the restorations were carried on between 1881 and 1884, a conscientious desire to preserve the famous building intact was present in the mind of the controlling intelligence; but the great capitals of the lowermost arcade upon which the whole weight of wall reposes were in many cases found to be so split that they were unsafe. It may well have been thought with perfect honesty that the preservation of the building required their removal; they were removed and placed with all care in a hall of the building, while newly cut capitals were put in their place. St. Mark's was more hardly treated, for the exquisite marbles with which the exterior was sheathed were carried off and replaced by slabs of a vastly inferior quality and color, a certain smoothness and a certain appearance of finish being thus got at the expense of the chromatic beauty of the original work. Nothing need be said of the mosaics, because they are always in a state of change, repairs and restorations going on all the time: but the change in the great floor of the church by which the singular waves and hollows which had marked it for so many years were all graded and the floor smoothed out into a glossy, modern pavement, excited at the time the greatest indignation on the part of many, and can hardly be satisfactorily criticized; there being so much doubt as to the true cause of the old inequalities.

There is still another difficulty in the restoration of buildings, namely, the introduction of later, though still early, details. Thus in a Gothic cathedral, especially in England, one whole bay of the north or south aisle will have been built up with 14th century windows, contrasting oddly with the "early English" fenestration of the neighboring bays. Shall the restorer respect these changes of an earlier time, or shall he sweep them all away and make the church that which, according to his best lights, it was in (say) 1195? It is evident that there is great room for disagreement as to this, and that no restoration of such building can ever satisfy the student altogether. It is evident that every precaution should be taken to save the old work and that the interests of fine art and archæology alike demand the preservation of every bit and scrap of building as it has reached us from antiquity, repairs being carried out only in so far as to save the ancient pile with all its details. At the same time excuses can readily be found for those who advocate a sweeping restoration: for, as they would say, the building was meant to be used and was meant to have a certain general aspect: is it not probable that we know enough to put it back to its original character? Unbelieving critics can never persuade these people of their own probable ignorance.

In sculpture the case is more simple. Until within the last 25 years an important antique statue was generally restored, and the most skillfully carried out restoration was perhaps that of the Ægina sculptures in the Glyptothek in Munich. These are said to have been directed by the celebrated sculptor, Bertel Thorwaldsen, and they have a wonderful appearance of verity, while at the same time no one can say how far

the surface of the marbles found in Ægina have been lowered in places to agree with the restoration. It has always been considered a wonderful piece of good fortune at a time too early for such intelligence in archæological matters—the preservation from restorations of the Venus of Milo in the Louvre, this preservation having been largely the result of disagreement. On the other hand, the finds of the years since 1870 are much more commonly preserved intact; no one will think of restoring the Hermes of Olympia. Even in our own time, however, such slight injuries as the breaking of two or three fingers in the Augustus of Otricoli in the Vatican, or in the Venus of the Capitol, are pretty certain to be repaired, but then it is the custom of all properly managed museums that a label shall hang on the pedestal with a full description of the additions made, and the catalogues of the better organized museums contain also such a mention in full.

In the matter of painting it has long been understood that there is only one safe way, and that is to refrain from bringing a brushful of paint anywhere near the canvas. The old picture has suffered certain injuries; it must not therefore be subjected to the greater injury of falsification. As late as 1885 paintings in several of the museums of Europe were undergoing repainting of the most radical sort. Any person who was looking into the matter at that time would miss from its place in a church or gallery some great canvas. If he were shrewd and bold he would get sight of that canvas set up against a wall on its side, or on its head perhaps, and there undergoing a process of repainting in sky or drapery at the hands of the most unintelligent operative who could use a palette and a painter's pencil. By and by the picture would be in its old place again, and then the few who look closely into a picture would feel that their old friend and inspirer was gone. The director of just such a restoration said to the writer that he was quite aware of the opinion of the foreign visitors that this ought not to be done—that only a patch of neutral color should be put in where an actual blister had existed—where color had left the canvas altogether—that, in short, the picture should be mended, but not repaired and renewed with an attempt to imitate its original surface. He was a good-tempered old gentleman, and made no pretense at artistic pride in his work, which indeed was going on at the hands of the most forlorn and careless copyists, but it was his work, for which his salary was paid. It was suggested long ago that every picture in a public gallery should have hung on its frame an exact account of what had been done to it and when—whether partial repainting or repairing of positive injuries, revarnishing, transferring from wood to canvas, or the like. This, however, has not been done as yet, and the student of the most precious paintings in the world is grievously handicapped by the primary difficulty of discovering what is really the artist's work and what is the ignorant tinkering of irresponsible moderns.

RUSSELL STURGIS.

Restoration, The, in English history a term applied to the accession of King Charles II., in 1660, after the civil war, to the throne of England, after an interregnum of 11 years and four months, from 30 Jan. 1649 (when Charles I. was beheaded) to 29 May 1660. In

French history, the first restoration begins 3 May 1814, when Louis XVIII. made his entry into Paris under the protection of foreign bayonets, and ended with the return of Napoleon from Elba, 20 March 1815. The beginning of the second restoration is generally reckoned from the battle of Waterloo, 18 June 1815; and terminated on 29 July 1830, with the abdication of Charles X.

Restorationists, the followers of Origen in the opinion that after a certain purgation proportionate to their delinquencies all will be restored to God's favor and to paradise. In the Middle Ages, the Brethren of the Free Spirit held this doctrine; at the time of the Reformation, it was taught by the Anabaptists and in the 18th century by the Rationalists. See also UNIVERSALISM.

Resumption, the return to specie payment by a government. The Resumption Act of 14 Jan. 1875 fixed 1 Jan. 1879 as the day on which specie payments should be resumed by the United States government. Resumption actually took place on 17 Dec. 1878, when the premium on gold disappeared.

Resurrection, an article of belief contained in all the formularies of the Christian faith, namely, that at the last day all the human creatures that shall have lived on earth will rise from their graves in the bodies which they had in life. It is a doctrine peculiar to the Christian religion, one not entertained by the pagan nations of antiquity nor by the Hebrews till the latter period of their history as a nation. In the Hebrew scriptures are many passages which favor more or less the doctrine of the resurrection of the dead; but such passages are in no instance free from ambiguity; and even were it to be granted that they unequivocally assert a resurrection, they do not accord with the doctrine that is taught in all the creeds of Christendom, namely, that when the period of man's life upon the earth is closed then the entire human race, not the good alone, but the wicked, not the blest alone, but those also who are destined to everlasting punishment shall arise from the grave with the bodies which they had in life and appear before the supreme tribunal. The passages of Hebrew Scripture that have been regarded as intimating this doctrine are chiefly Isaiah xxvi. 19, Job xix. 23-27, and Daniel xii. 2. The passage of Isaiah, as rendered in the Authorized Version is, "Thy dead *men* shall live; *together with* my dead body they shall arise." The words italicized are supplied by the translators. In the Septuagint the latter half of the passage is rendered, "and those in the graves shall arise." If this is unequivocally a declaration of the resurrection of the bodies of men, at least it does not assert that there will be such a resurrection of the entire human race. Job xix. 25-27 reads: "I know that my redeemer liveth and that he shall stand at the latter *day* upon the earth; and *though* after my skin *worms* destroy this *body*, yet in my flesh shall I see God: whom I shall see for myself, and mine eyes shall behold, and not another." Again a mutilated Hebrew text, with variant readings and variously translated in the versions: but granted that it tells of a resurrection on the last day, it says at most only that Job will then appear in his body as when he lived—one man, not all mankind.

VOL. 13—28

Much clearer and stronger is the passage, Daniel xii. 2, "Many of them that sleep in the dust of the earth shall awake, some to everlasting life, and some to shame and everlasting contempt": this is explicit, but it does not say that *all* the dead will arise clothed in their bodies; and this becoming "awake" does not necessarily imply re-assumption of the bodies at all. Toward the time of the downfall of the Jewish nation the belief in the resurrection of the body was generally entertained among the Jews: in the apocryphal book 2 Maccabees the doctrine of the resurrection is strongly asserted, yet even there nothing is said about a resurrection of all the dead; and though the resurrection of all the dead is now the 13th article of the Jewish creed, it is a doctrine that cannot be proved from the Talmud or the Midrashim, according to which only the just will rise again. But in the books of the New Testament the resurrection of all on the last day is explicitly declared, and in all the formularies of Christian belief, beginning with the Apostles' Creed, this doctrine is most distinctly asserted. That not only the just but also the wicked shall rise again is explicitly taught by the Founder of Christianity in Matt. v. 29, x. 28, and particularly in John v. 28, 29, "The hour is coming in which all that are in the graves shall hear his voice, and shall come forth; they that have done good, unto the resurrection of life; and they that have done evil, unto the resurrection of damnation."—THE RESURRECTION OF JESUS CHRIST on the third day after his crucifixion is by Saint Paul made the very basis of Christian faith: "If Christ be not risen then is our preaching vain, and your faith is also vain." The evidence of the truth of Christ's resurrection, for those who were to form the first nucleus of his church was the fact that on eleven different occasions between the resurrection and the ascension into heaven he manifested himself to his apostles and others, his companions and friends; and these testify to the truth of this resurrection in clear, definite, positive statements. Those who deny the objective reality of Christ's resurrection—and it was denied in the very first age of the Church—attempt to explain it away on various grounds; but his disciples distinctly testified that it was Jesus himself, in corporeal presence, who conversed with them at sundry times during the 40 days preceding the ascension.

Resurrection, a novel by Leon Tolstoy, published in 1900. It presents in the author's strongest manner the theme of the development of a great character, besides offering a picture of Russian society, from the wealthy office-holding circle, to the peasants and common soldiers, jailers, and criminal classes. Nekhludoff, a noble, in the effort to right the wrong he has done to another, unconsciously rights the wrong done in himself by the false social outlook and inadequate education which had made him what he was, and constructs for himself a new and broadly human creed of living.

Resurrection Fern. See FERNS AND FERN-ALLIES.

Resurrection Plant. See ROSE OF JERICHO.

Resurrection Sisters. See ORDERS, RELIGIOUS.

Resurrectionists, or **Body-snatchers**, a class of miscreants who, in Britain previous

to the passing of the Anatomy Act of 1832, made a livelihood by rifling graves, taking out the corpses and selling them to schools of medicine and surgery as "subjects" for dissection or demonstration. So long as in Britain the supply of "subjects" from the gallows sufficed for the needs of the schools, there was no call for a resort to illegal means. But when, in the progressive reform of criminal law, capital punishment was less frequently inflicted, while medical and surgical schools were greatly multiplied, the necessity for "subjects" overrode the laws, and the trade of the resurrectionist flourished. As the schools were mostly in London, the graveyards in the vicinity of the metropolis were the main resource of the body-snatchers, with whom the grave-diggers and the caretakers were usually in league. As the business was naturally risky and precarious the price of "subjects" was, for each, \$40 to \$50. To protect the bodies of the newly interred, their graves would be protected with strong gratings, or spring-guns would be set at night, or the friends of the deceased would keep watch, armed, over the graves for several nights till the bodies had become unfit for use in the schools. These precautions made the business of the body-snatchers even more risky, and "subjects" would be sought in various localities throughout the kingdom. As the price paid by the doctors rose and the risk grew greater, it occurred to one Burke at Edinburgh to provide subjects for the dissecting table by killing people instead of violating graves. He was hanged at Edinburgh 28 Jan. 1829, convicted of having despatched 15 victims and sold their bodies to the doctors. The first Anatomy Act of the British Parliament (1832) provides that schools of anatomy and teachers and demonstrators of anatomy shall be licensed; such schools and such teachers are empowered to receive as subjects for dissection the cadavers of persons dying friendless, in poorhouses, hospitals, and elsewhere; and the trade of the resurrectionist was practically done away in Britain by the passage of the act. In the United States there are not in any of the individual States any statutes regulating the practice of anatomical dissection: the plundering of graves for subjects of dissection is a misdemeanor for which the offender may be indicted at common law. Instances are not very rare of the bodies of persons, not friendless, who die in public or quasi-public hospitals, being, without legal warrant, sold to the schools by subordinate employees of such hospitals. Body-snatching, or rifling of graves for the purpose of exacting a ransom from the families of the dead is not infrequent: a notable instance was that of the stealing of the body of the late A. T. Stewart in 1878. The body-snatchers in this case demanded a ransom of \$200,000, which afterward they reduced to half that sum: finally, they received \$20,000 with the assurance that they should not be prosecuted: since that time extraordinary precautions are taken against body-snatching from the graves, especially of very rich persons.

Reszke, rěsh'kě, **Edouard de**, Polish opera singer: b. Warsaw 23 Dec. 1856. He studied at the Collège de l'Agriculture of Proskao, and then turned attention to the cultivation of his remarkable bass voice. He appeared in Paris in 1876 at the Théâtre Italien, and since then has sung in the large cities of Europe and America.

He created the role of the King in Catalini's 'Edda' and Carlo V. in Marchetti's 'Don Giovanni d'Austria' at Turin. He is especially identified with Mephistopheles in 'Faust'; Frère Laurent in 'Romeo et Juliette,' and the Wagnerian roles of Hans Sachs, Wotan and King Mark.

Reszke, Jean de, Polish opera singer: brother of Edouard de Reszke (q.v.): b. Warsaw 14 Jan. 1853. He completed the law course at the Warsaw University; but having been surrounded by a musical atmosphere in his home, and having sung as a boy in the cathedral, he decided upon singing as a career. He studied with Ciaffei and Cologni in Italy and made his début in Venice in 1874 as Alfonso in 'La Favorita.' In the two following years he appeared in London and Paris. Hitherto he had sung baritone roles, but in 1876 he retired to cultivate his natural voice whose register was that of a tenor. In 1880 he reappeared, singing at Madrid in 'Robert le Diable.' Following this he created the part of Jean in Massenet's 'Herodiade' in Paris and was engaged at the Opera where he sang from 1885 to 1890, appearing in 'Le Prophète,' 'L'Africaine,' 'Aida,' 'Faust,' 'Romeo et Juliette,' 'Don Juan,' and 'Le Cid' which Massenet composed for him. From 1893 to 1899 he appeared continuously at the Metropolitan Opera House, New York, where he added to the foregoing roles several Wagnerian parts, particularly 'Siegfried.' In recent years he has been associated artistically with his brother Edouard.

Retaining Wall, a wall erected for the purpose of confining a body of water in a reservoir, or for resisting the thrust of the ground behind it. Without such a wall the earth would lie at a considerable angle off the perpendicular. The angle it makes with the horizontal is called the angle of repose, and varies with the nature of the material. The amount of resistance necessary to be afforded by the wall depends partly on the material and partly on the angle of repose. For the pressure against the wall is produced by the material filling the space between the angle of repose and the face of the wall; and the less this angle the greater the quantity of material required to fill the space, and the heavier the material the greater the pressure. It will hence appear that the great condition to be observed in the erection of these walls is that the sum of the forces tending to displace the wall shall be exceeded by the force tending to produce stability. As a general rule the thickness of retaining walls is made one third the height of the bank which they are intended to support. In estimating the requisite thickness of the wall, account must be taken of the different ways in which it may be displaced, as by overturning, slipping along its entire base, or the giving way of the upper parts while the base remains. In reservoir walls of masonry, the thickness should be made practically double that of ordinary earth retaining walls.

Retentiveness, a quality of memory by which the after-effects of mental processes are long held, with capability of reproduction. Retention is of primary importance in judgment, particularly in the study of processes that are continuous, or in which there is a continuity of interest. Thus when one hears a succession of sounds, and judges that the second, for instance,

is louder than the first, the property of retention, by which the after-effect of the hearing of the first sound is compared with the second, is of great importance. In many this attribute of retentiveness is weak, seriously impairing their judgment. See JUDGMENT; MEMORY AND ITS DISEASES.

Rethel, *rä'těl*, **Alfred**, German painter: b. Aix-la-Chapelle 15 May 1816; d. Düsseldorf 1 Dec. 1859. He studied at the Academy of Düsseldorf (under W. Schadow) and afterward at Frankfort (under Philip Veit and Schwind). Here he painted 'The Resurrection of Christ' (in the Church of Saint Nicholas), 'Daniel' (in the city museum), and 'Justice Pursuing a Fleeing Murderer.' When there was a competitive exhibition held of designs for frescoes in the town-house of Aix-la-Chapelle representing incidents in the life of Charlemagne, he was chosen to do the work, and lived to complete four of them; the other four being executed from his designs after his death. These are considered the finest productions of his brush. He painted in water-color a series of pictures illustrative of 'Hannibal's Passage of the Alps,' which were afterward reproduced by wood engraving. In 1848 he executed his 'Dance of Death'; and drew a number of designs on wood. His style was notable for grandeur and energy, and his frescoes are among the finest modern examples of that style in Europe. In 1852 he was seized with a nervous affection for which he sought relief by traveling, but died insane.

Retiarius, *rē-shī-ā'ri-ūs*, a netman, that is, a Roman gladiator who wore only a short tunic and carried a trident and net, with which he endeavored to entangle and dispatch his adversary, who was armed with helmet, shield, and sword.

Retina. See EYE.

Retreat, **Spiritual**, or **Retreat**, in devotional language, a season of retirement from ordinary secular occupations and of prayer, of meditation upon the truths of religion and the duties of the Christian life, of examination of conscience, of serious consideration of one's spiritual state, etc. The Retreat is also called the Spiritual Exercises, that being the name given to it by Saint Ignatius de Loyola, whose plan of the Exercises (*Exercitia spiritualia*) has ever since his day been the directory of the Spiritual Retreat. The Exercises are arranged for a retreat of 4 weeks, but usually the time is abridged to 10 days or a week. See EXERCISES, SPIRITUAL.

In military language, a retrograde movement, whether forced or strategical, by which troops retire before an enemy: it differs from a flight in being orderly and under control. An army in retreat must be covered by a powerful rear-guard, which from time to time must, if the enemy is pursuing, hold the pursuers at bay, while the artillery and the baggage pass defiles, cross streams or overcome any obstacles.

Retribution, in anthropology and in law: in anthropology the retribution theory expresses the belief in states of happiness or of misery in another world, allotted to men according to their deserts while living on earth. Tylor ('Primitive Culture,' ch. xiii.) does not find this idea existing universally in the religions of the lower range of culture that have not been affected by contact with higher religions. The

most primitive view of the life beyond the grave was, he holds, that it is simply a continuation of the present: to this succeeds the belief that excellence valor, social rank, etc., modify circumstances and surroundings in the next life; out of this, he believes, was finally developed a doctrine of future rewards and punishments.—In law, the theory of retribution, or retributive theory is, that punishment is inflicted in retribution for an offense, and ought to be similar to the misdeed: this is the principle of the retribution prescribed in the Hebrew law—"an eye for an eye, and a tooth for a tooth." In modern legislation deterrence displaces retribution: it is held that no more punishment should be inflicted than suffices to deter others from committing the offense: even the death penalty is not defended on the principle of "Life shall go for life," but because with abandoned criminals capital punishment has a more deterrent effect than has life imprisonment.

Retriever, a dog, trained to find out and bring back any killed or wounded game. The two varieties of British retriever differ only in coat. The larger and more familiar breed of retrievers, the wavy-coated, is formed by crossing the Newfoundland and the setter; the smaller or curly-coated breed is formed by crossing the water-spaniel and the terrier. The typical retriever is 20 or more inches high, with a stoutly-built body, strong limbs, webbed toes, and black and curly fur. See Dog.

Returning Boards. All State governments have provision for the final canvass of votes in State elections by some central authority, known as a returning board, or by some similar designation. The duties of these boards are ministerial, and they have no right to go outside the face of the returns. In the Presidential election of 1876 the returning boards of Florida, South Carolina and Louisiana, controlled by the "carpetbag" and negro element, went behind the returns, and assumed to cast out sufficient votes on the ground of alleged fraud and intimidation to give those States to the Republican electors. A great ferment resulted, and in order to allay the agitation and arrive at a correct conclusion, an electoral commission was appointed, which decided in favor of the Republican candidate, Rutherford B. Hayes.

Retz, *rētz*, **Rais**, *rāz*, or **Rays**, *rāz*. **Gilles de Laval de**, French military officer: b. 1404; d. 26 Oct. 1440. He was a Breton of high rank, and distinguished himself under Charles VII. in the struggle with the English, fighting by the side of the Maid of Orleans. Subsequently he received the baton of marshal. He retired to his estates, but was brought to trial by the Bishop of Nantes, charged with sorcery and the practice of cruelty in the celebration of demoniac rites. He was convicted and burned. Attempts were once made to find in Retz a historical original of Bluebeard, but, of course, in vain.

Retz, **Jean François Paul de Gondi**, **CARDINAL DE**, French politician: b. Montmirail 19 Sept. 1613; d. Paris 24 Aug. 1679. His instructor was the celebrated Vincent de Paul. In 1643 he received a doctorate at the Sorbonne, and was appointed coadjutor of the archbishop of Paris. Although preferring military service he found he could gratify his ambitions in the church and his impassioned eloquence won him the favor of the Parisians. Aiming at political

influence he incurred the enmity of Richelieu, and, after his death, of Mazarin. The Fronde, or the party opposed to the court and Mazarin, received the coadjutor as a man whose genius and popularity made him a valuable accession, and De Retz embraced their cause with zeal. The various insurrections of the people and the Frondeurs obliged Mazarin to leave France, whereupon De Retz seemed to have it in his power thenceforth to hold the reins of government. But Mazarin soon returned from his banishment, more powerful than ever. The Fronde, which had never been firmly united, and the members of which, with the exception of Condé and De Retz, were weak and wavering, was dissolved; and soon after the latter, not without the management of his enemy Mazarin, had obtained the cardinal's hat, he was unexpectedly seized and confined in the castle of Vincennes, whence he was subsequently removed to Nantes. Here he found means to escape, and, perpetually pursued by officers of Mazarin, wandered for eight years through Europe.

After the death of Mazarin in 1661 he was allowed to return to France, after having promised never to take part again in political combinations. He now resigned his archbishopric, governed the abbey of St. Denis, lived retired, restricted his wants, paid his immense debts, and distributed pensions to his friends. Reconciled with all parties he lived the retired and quiet life of a philosopher. His posthumous 'Mémoires' (1718) give an interesting picture of his character. The best edition of his works is that in the 'Grands Ecrivains de la France' series (1872-90). An abridged edition was published in 1865 in one volume. Consult: Chantelauze, 'Le Cardinal de Retz, Etude historique' (1878); 'Le Cardinal de Retz et ses Missions diplomatiques à Rome' (1819).

Retzsch, rêtsh. **Moritz**, German artist: b. Dresden 9 Dec. 1779; d. Holflossnitz, near Dresden, 11 June 1857. As a painter his subjects were taken largely from German and Greek mythology and display beauty in drawing and color. Retzsch's illustrations of the great poets, comprehending the drawings executed by him for editions of Goethe's 'Faust,' and the works of Schiller and Bürger, have rendered him deservedly famous. He executed a 'Shakespeare Gallery' consisting of 80 plates. In 1824 he was appointed a professor in the Art Academy at Dresden. His illustrations of poetry and legend were done in outline and are distinguished by exquisite delicacy and refinement of form and expression.

Reuchlin, roih'lin, **Johann** (Hellenized ΚΑΡΝΙΟ), German Hebrew scholar and humanist: b. Pforzheim, Baden, 22 Feb. 1455; d. Liebentzell 30 June 1522. The excellence of his singing procured him a place in the chapel of the Margrave of Baden, who appointed him traveling companion to his son Frederick, afterward bishop of Utrecht. In 1473 Reuchlin accompanied that prince to Paris, and there studied Greek under Hieronymus of Sparta, besides applying himself assiduously to Latin composition and Hebrew. In 1475 he went to Basel, and after some time spent in the study of Greek began to teach that language, with Latin and philosophy. At this time also he wrote his Latin dictionary, 'Breviloquus, id est Dictionarium singulas Voces Latinas breviter explicans'

(1478), the first published in Germany. In 1478 he went back to France, and studied law at Orleans, while he taught, at the same time, the ancient languages. In 1481 he returned to Germany, and taught law and the belles-lettres at Tübingen. Eberhard, count of Württemberg, soon after took him, as the best Latinist in Germany, in his train on an embassy to Rome. The Emperor Frederick II. created him a noble of the empire in 1492. After Eberhard's death Reuchlin lived several years at the court of Philip, elector of the Palatinate. Here he enriched the Heidelberg library with manuscripts, and productions of the new art of printing. He was subsequently appointed president of the court of the confederacy which had been established by the Swabian princes against the encroachments of the house of Bavaria. He was also engaged in translating the penitential psalms, preparing a Hebrew grammar and dictionary, and correcting the translation of the Bible. A converted Jew, John Pfeffercorn, and Hoogstraten, an inquisitor, obtained from the Emperor Maximilian, in 1509, an order that all Hebrew works, the Old Testament only excepted, should be burned, on the ground that they were full of blasphemies against Christ. The emperor, however, consulted Reuchlin, who assured him that these works, instead of injuring Christianity, contributed, on the contrary, to its honor and glory, since the study of them produced learned and bold champions to fight for the honor of the Christian religion, and that to destroy these books would be to put arms into the hands of its enemies. The order was thereupon recalled, but a war of pens raged for ten years. Passages were extracted from Reuchlin's works and their meaning perverted; on the ground of which a charge of heresy was brought against him. He was summoned in 1513 before the Inquisition at Mainz, presided over by Hoogstraten, and by a decree of that tribunal his writings were consigned to the flames. This roused the indignation of the friends of classical literature, and an appeal was made to Pope Leo X., who referred the whole matter to the Bishop of Spire. That prelate declaring Reuchlin innocent, ordered the monks to pay the expenses of the investigation. A counter appeal was made by Hoogstraten; but Reuchlin was then acquitted by a commission of prelates held at Augsburg in 1516; and the pope issued a mandate that all proceedings against Reuchlin should be stopped. In the course of this contest appeared the 'Epistolæ Obscurorum Virorum,' in which the enemies of Reuchlin were ridiculed. When, in 1517, he received the theses propounded by Luther, he exclaimed, "Thanks be to God, at last they have found a man who will give them so much to do that they will be compelled to let my old age end in peace." In 1518 he was appointed professor of Hebrew and Greek at Wittenberg, but sent his nephew Melancthon instead, and William of Bavaria appointed him professor in the University of Ingolstadt. Although suspected of a leaning toward Protestantism, he never left the Roman Catholic Church. Consult: Geiger, 'Johann Reuchlin: sein Leben und seine Werke' (1871); Geiger, 'Johann Reuchlins Briefwechsel' (1875); Horawitz, 'Zur Biographie und Korrespondenz J. Reuchlins' (1877); Holstein, 'J. Reuchlins Komödien' (1888).

REULEAUX — REUSS

Reuleaux, ré-lô, Franz, German mechanical engineer: b. Eschweiler, Prussia, 30 Sept. 1829. He served an apprenticeship at Koblenz, studied at Karlsruhe and for a year was director of a factory in Cologne. In 1856-64 he taught at Zürich and in 1864-96 was engaged in teaching in Berlin, where he was director of the Industrial School from 1868-96. The German exhibit of machinery at the Philadelphia Exhibition in 1876 greatly impressed Reuleaux with the inferiority of German construction and design and he earnestly strove to remedy the fault. He gathered at Berlin a fine collection of kinematic models and wrote: 'Der Konstrukteur' (1860-2); 'Briefe aus Philadelphia' (1877); 'Kurzgefasste Geschichte der Dampfmaschine' (1891); 'Thomassche Rechenmaschine' (1892); etc.

Reuling, roi'ling, George, American ophthalmologist: b. Romrod, Germany, 11 Nov. 1839. He was educated in Berlin and Vienna, served as surgeon in the Prussian army during the war with Austria, and in 1866-7 was assistant surgeon at the Eye Hospital in Wiesbaden. He studied in Paris in 1867-8, came to Baltimore and in 1869 was appointed physician-in-chief to the Eye and Ear Infirmary there. He was professor of ophthalmology at the University of Baltimore, of eye and ear surgery at Washington University, Baltimore, and since 1886 has been professor of eye and ear diseases at the Baltimore Medical College. He is eye and ear surgeon to various hospitals and institutions, has invented an apparatus for eye and ear surgery and written various articles on the subject.

Reumont, roi'mönt, Alfred von, German historian: b. Aix-la-Chapelle, Prussia, 15 Aug. 1808; d. Burtscheid, near Aix-la-Chapelle, 27 April 1887. He was educated at Bonn and Heidelberg, and in 1835 entered the Prussian diplomatic service. From 1857-60 he was minister resident at Florence, Modena and Parma successively. Besides several valuable biographies, including 'Michelangelo' (1834); 'Andrea del Sarto' (1835); and 'Benvenuto Cellini' (1887); he wrote: 'Ganganelli, seine Briefe und seine Zeit' (1847); 'Geschichte der Stadt Rom' (1867-70); 'Charakterbilder aus der neueren Geschichte Italiens' (1886); etc.

Réunion, Isle de la, êl dè lâ râ-ü-nê-ôn, or Isle of Bourbon, in the Indian Ocean, about 400 miles east of Madagascar, a French insular colony, with an area of about 965 square miles, its length being 45 miles and breadth 33 miles. It was discovered by Mascarenhas, a Portuguese, in 1545, who called it by his own name. The French took possession in 1649, and gave it the name of Bourbon. It was captured by the British in 1810, and restored to France in 1815. The island is of volcanic origin, composed of two enormous volcanic mountains, in one of which the fire is extinct; the other is still in activity. The loftiest summit, Le Piton de Neige, or the Snowy Pike, is about 10,000 feet above the level of the sea. The climate is excessively hot from November to April; the evenings, however, are refreshed by the sea breezes, and the mornings by the land breezes. The capital is Saint Denis, a pretty town; pop. (1899) 32,850. Other urban centres are Saint Pierre, and Saint Benoit, connected by a railway 83 miles long with the chief port, Pointe-des-Galets. The principal articles

of export are coffee, sugar, vanilla, gums, lichens for dyeing, cotton, hides, etc. Sugar is by far the most valuable export; vanilla comes next. Commerce is impeded by the want of good harbors. The population consists of (1901) 173,230 native Africans, Chinese, coolies, Malays, etc., with a French administration and military force of about 1,000.

Réus, rá'oos, Spain, in the province of Tarragona, is an important railway station and a progressive town, with a port at Salou on the Mediterranean, four miles distant. It has excellent schools and model public institutions. Its importance as a commercial centre has increased in a marked manner during the last quarter of a century. Its export houses represent great local industries in the agricultural products of flour, wine, and fruit. Pop. (1900) 26,221.

Reusch, roish, Friedrich, German sculptor: b. Siegen, Prussian Westphalia, 5 Sept. 1843. He received lessons at the Berlin Academy, and afterward from Albert Wolff. In 1874 he traveled in Italy for purposes of study, and on his return executed some military statues for Siegen and Bensberg, and a group in marble for the Belle Alliance bridge at Berlin. A lucky inspiration was his 'Demon of Steam.' This spirited and highly original work was modeled in 1880, and subsequently cast in bronze and set up in the Scientific High School at Charlottenburg. He became teacher in the Art Academy of Königsberg (1881), and meanwhile executed numerous busts and statues for public buildings; the monuments of Vessel, the astronomer, and Jacobson, the oculist; the sepulchral monument of Gen. Bronsart von Schellendorf, and the colossal figure of Emperor Wilhelm I. in his coronation robes which stands in front of the palace (1894). Of his imaginative works the most notable are 'Psyche Appeasing Cerberus'; 'Cupid Putting on the Helmet of Mars'; and the 'Triumph of Cupid over Hercules.'

Reuss, rois, Eduard Wilhelm Eugen, German theologian: b. Strasburg, Germany, 18 July 1804; d. there 15 April 1891. He was educated at the University of Strasburg, in Halle and in Paris, was privat-docent at Strasburg and occupied the chair of theology there in 1836-8 and in 1872-88. He was a leader among the liberal Protestant theologians of his day, and an able writer and translator. His works include: 'History of the Sacred Scriptures of the New Testament' (1842); 'History of the Canon of the Sacred Scriptures' (1862); 'The Bible, New Translation, with Commentary' (19 vols., 1877-9); etc.

Reuss, Germany, two central principalities, belonging to an older and a younger line, somewhat intermingled with and lying between Saxony, Bavaria, and the Saxon duchies. Total area of both principalities, 441 square miles, mostly mountainous. The territory of the older line, the principality of Reuss-Greiz, consists of the lordships of Greiz and Burgk, and has an area of 122 square miles. These lordships are separated, one being traversed by the White Elster, while the other lies along both banks of the Saale. The surface is better adapted for pasture than agriculture, rearing great numbers of horned cattle and sheep, but scarcely raising grain sufficient to meet the consumption.

REUSS—REVELATION

The most important crops are potatoes and flax; hops also are partially grown. The weaving of woollen, linen, and cotton fabrics is also among the principal occupations of the people. The capital is Greiz, and the only other town is Zeulenroda. The territories of the younger line, called the principality of Reuss-Gera-Schleiz-Lobenstein-Ebersdorf, have together an area of 319 square miles. These territories are, on the whole, fertile and well wooded, raise sufficient grain to supply the consumption, and possess among their minerals marble, salt, and iron. The capital is Gera, and other towns are Schleiz, Saalburg, Hirschfeld, and Lobenstein. The division into an older and a younger branch dates from 1616. Since 1668 all the princes of both lines have been called Heinrich (Henry). Both lines, as well as the great majority of their subjects, are Protestants. The principality of Reuss-Greiz had a population in 1900 of 68,396; Reuss-Schleiz, of 138,993.

Reuss, Switzerland, a tributary of the Aar, rising on the north face of the Saint Gothard, flowing north past Andermatt and Amsteg, between which places its course is through a wild and narrow gorge, spanned by the Devil's Bridge and other wonders of Swiss roadmaking, and entering the south end of the Lake of Lucerne. This it leaves again at its north end, at the town of Lucerne, and, still going nearly due north, reaches the Aar near Windisch (Aargau). Its length is 90 miles.

Reuter, *roi'tër*, **Fritz**, German dialect poet and story writer: b. Stavenhagen, Mecklenburg-Schwerin, 7 Nov. 1810; d. Eisenach 12 July 1874. He studied law at the universities of Rostock and Jena, and in 1833 was condemned to death at Berlin for his share in a students' democratic society. His sentence was, however, commuted by the king to 30 years' imprisonment. Till 1838 he was a close prisoner in various Prussian fortresses, and after a farther period of confinement in the Mecklenburg fortress of Dömitz was set free in 1840. For 10 years he devoted himself to farming, but in 1850 became a private teacher in the Pomeranian town of Treptow. In 1853 he was made famous by the publication of humorous poems in the Platt-Deutsch dialect, entitled 'Läuschen un Rimels' (new series, 1858). These were followed by 'Polterabendgedichte' (1855) and 'Reis' nah Bellegen' (1855). His later works comprise: 'Kein Hüsung' (1858), a tragical village story in verse; 'Hanne Nüte und de lütte Pudel' (1859); 'Schürr-Murr' (1861), a collection of tales in both Low and High German; and 'Olle Kamellen' (1860-8), his chief prose work, a series of tales in Platt-Deutsch, including 'Ut de Franzosentid' (1860); 'Ut mine Festungstid,' an account of his conviction, and imprisonment (1862); 'Ut mine Strontid,' his masterpiece (1864); 'Dörchlauchting' (1866); and 'De Reis' nah Konstantinopel' (1868); 'Die Drei Langhäuse' (1878), a satirical play; 'Lustspiele und Polterabendgedichte' (1883); and 'Reuter-Reliquien' (1885). Reuter's stories are lacking in plot, but are marked by clever episodes, skilful character drawing, and a humor, which, despite the difficulty of his medium, was universally appreciated in Germany. An addition of his works appeared in 1863-8, and in 1875 two volumes of 'Nachgelassene Schriften,' with biography, were added by Wilbrandt. Con-

sult the 'Briefe an seinen Vater' (ed. Engel, 1896); Lives by Romer (1895); and Wilbrandt (in 'Geisteshelden' 2d ed. 1896).

Reuter, **Paul Julius**, **BARON**, German telegraph promoter: b. Cassel, Germany, 21 July 1816; d. Nice, France, 25 Feb. 1899. He settled in Aix-la-Chapelle in 1849, where he first established his system of transmitting news by telegraph to the leading towns on the continent, and in 1858 removed to London, where he undertook to supply the English newspapers with foreign news. His enterprise, known as "Reuter's Agency," occupied a unique field and grew in importance from year to year until it is now in operation in all parts of the world. In 1865 he obtained the permission of the government to lay a cable from England to Cuxhaven, and shortly after to lay one between France and the United States. In 1872 the shah of Persia granted to him the exclusive rights of constructing railways, farming customs, and control of the natural resources of the country, but later exchanged these privileges for that of establishing the bank of Persia. He was created baron by the Duke of Saxe-Coburg-Gotha in 1871.

Reuter Dahl, *roi'tër-dal*, **Henry**, American naval artist: b. Malmo, Sweden, 12 Aug. 1871. He received his academic education at Stockholm, Sweden, and after remaining in this country served as newspaper correspondent during the Spanish-American War. He has contributed to various prominent periodicals in this country and England, and illustrated the 'History of the New American Navy' (1903) by John D. Long (q.v.).

Reutlingen, *roit'ling-ën*, Germany, in Württemberg, capital of the circle of the Schwarzwald or Black Forest, on the Echaz, affluent of the Neckar, 20 miles south of Stuttgart. The Church of St. Mary is of great antiquity (13th century), and its tower, 325 feet high, of Gothic type, considered the most beautiful in the kingdom. The environs of the town are most romantic. Its leather and textile industries are important. Pop. (1900) 21,494.

Reveillé, *rě-vāl'yě*, or *rěv-ě-lě'*, the signal given in camp and garrison at break of day, by beat of drum or sound of bugle, for the soldiers to rise and begin the duties of the day.

Revel, *rěv'ěl*, or **Reval**, *rěv'al*, Russia, capital of Esthonia, on a small bay of the same name, 238 miles southwest of Saint Petersburg. The ancient part of the city on a rocky eminence is surrounded by Gothic walls and contains the cathedral, castle, governor's residence, high school, and aristocratic quarters; other churches, the town-hall, several fine halls, schools, etc., are located in the lower, or commercial, town. There are two harbors: mercantile and naval. Commerce is comparatively unimportant. Flax, linseed, grains, skins, and potato brandy are exported; salt, wine, fruits, and manufactured and colonial goods imported. Pop. (1897) 64,578.

Revelation, in theology, the communication of truth by God to men; also, the truth so conveyed, and especially in the Scripture. There is a revelation of God's will and his purposes made through man's reason and the voice of conscience: Nature everywhere reveals God's attributes—his power, his goodness, his wisdom, his providence; so, too, the history of

REVELATION — REVENUE CUTTER SERVICE

the tribes of mankind upon the earth affords proofs of divine governance. But the most express revelation of God's purposes toward man is made in the written word, in the record of special divine communications made in time past to holy men "who spake as they were moved by the Holy Spirit"; and this written word is the key to all the other revelations of the divine nature and the divine will. See **INSPIRATION**; **BIBLE**.

Revelation, Book of. See **APOCALYPSE**.

Revelganj, or **Godna**, India, in Bengal, near the confluence of the Ganges with the Ghagra, has an active local trade. It is famous as the home of Gautama, the founder of Buddhism, who also taught here. Pop. 14,750.

Rev'els, Hiram R., American legislator and Methodist clergyman: b. Fayetteville, N. C., 1 Sept. 1822; d. Aberdeen, Miss., 16 Jan. 1901. He was of African descent, was educated at Knox College, Illinois, and ordained to the ministry in 1847. For several years he traveled among the colored people in Ohio, Illinois, Indiana, and Missouri, engaged in preaching and lecturing, and later settled in Baltimore, Ohio, where he acted as a minister and as principal of a high school for colored students. In the Civil War he assisted in the organization of colored regiments and went to the front as chaplain. He settled in Natchez, Miss., after the war, and became an influential citizen. He was a member of the city council of Natchez, elected to the State senate in 1869, and in 1870 was sent to the United States Senate, the first of his race to become a member of that body. He was president of the Alcorn Agricultural and Mechanical University, Rodney, in 1871-83, and at his death was a presiding elder in his church.

Revels, Master of the, an English court officer in former times appointed to superintend the revels or amusements, consisting of dancing, masking, etc., in the courts of princes, the inns of court, and noblemen's houses, during the 12 Christmas holidays.

Revenue, the income of a nation, derived from taxation in various forms. In England the principal source of revenue is the income tax. In the United States the national government derives its revenue chiefly from tariff duties, and internal taxes on alcoholic liquors and tobacco. The revenues of the various States and municipalities are mainly from taxes on land and buildings, and personal property. New York and some other States have an inheritance tax which brings in large returns, so that the New York State government is supported almost without direct taxation. So far as the large majority of citizens are concerned, the forms of taxation in the United States are not directly appreciable. In some countries of Europe revenue is collected by most vexatious methods. In Vienna a small tax is exacted every time the resident of an apartment house goes in or out of the building between 10 p.m. and 6 a.m., the person in charge of the building being the collector, and responsible to the authorities. Methods hardly less annoying are practised in other European cities. The "octroi," a tax on produce of any kind brought into a city from the country districts, is prevalent throughout Europe, and adds to the cost of all kinds of food.

Revenue Cutter, a small armed steam vessel, designed for the prevention of smuggling; so called from the fact that originally the vessel was of the cutter-yacht type. The United State Revenue Cutter Service is a branch of the Treasury Department and its purpose is, principally, to enforce the customs revenue laws. Its immediate supervision resides in a bureau of the department known as the Division of Revenue Cutter Service, which is in charge of a chief and a number of assistants.

Revenue Cutter Service, United States.

This service was born in the evening of the 18th century, and therefore on the 4th of August, the current year (1904), it will have been in existence during 114 years of the lifetime of the Republic.

The organization of this service was the conception of our first great secretary of the treasury under the Constitution, Alexander Hamilton, and his recommendations in the premises had the approval of George Washington. In emphasizing its importance Hamilton recommended "giving the officers military or naval rank, which will not only induce fit men to engage, but attach them to their duties with a nicer sense of honor."

The original purpose was to inaugurate a "preventive service," as against illicit trade by sea, and in that sense, to aid the customs service in the collection of the revenue from duties on imposts. The organic act provided for ten small vessels, armed and equipped, and for each a complement of officers and enlisted men, and these formed the nucleus from which has grown the service of to-day.

From the beginning the service was placed upon the same plane as to pay and allowances for its officers and enlisted men, with the officers and soldiers of the army.

Various acts of Congress (1 Oct. 1790, 2 March 1793, 6 March 1796, 1 July 1797) provided for additional and larger vessels, increase of crews, armaments and equipments.

It is interesting to note that this service was the only semblance of a navy possessed by our government from 1790 to 1797, when on 10 July, in the latter year, the first vessel of the then new navy, the 44-gun frigate *United States*, was launched.

In the meantime the duties of the service were such as were required of an armed service, in guarding the coast and commercial interests, and also against piratical incursions. But during those years our relations with France were becoming strained, culminating finally in active hostilities at sea between vessels of the United States and of France. The difficulties with France, generally known as the "Quasi French war," may be said to have been the first war of the young republic with a foreign power. During its continuance (1798 to 1801) several engagements were fought and many captures were made by our vessels.

The revenue cutter service took an active and brilliant part in co-operation with the navy. Thus, while this service was organized as a preventive service to be operated in the interest of commerce and for the protection of the revenue, it had, in these early years, rapidly developed into an armed and equipped military or naval service, offensive and defensive, and

REVENUE CUTTER SERVICE

this character has been well and continuously maintained.

At the breaking out of hostilities with France provision for an armed force upon the sea, to convoy merchantmen and to defend the coast, became indispensable. To accomplish these purposes the President was authorized (Act 1 July 1797) to increase the complements of the several revenue cutters, and to employ them in defensive operations on the coast. Under authority of previous enactments the service had been provided with a number of vessels which, for that time, were of considerable size and able sea-going qualities, so that in this year (1798) there were in commission the following named efficient vessels, aggregating 1,140 tons, carrying 96 guns and 410 men:

| | Tons | Guns | Seamen and Marines |
|----------------------------|------|------|--------------------------|
| Brig Pickering | 187 | 14 | 70 |
| " Eagle | 187 | 14 | 70 |
| Schooner General Greene .. | 98 | 10 | 34 |
| " Scammel | 98 | 10 | 34 |
| " Governor Jay .. | 187 | 14 | 70 |
| " Virginia | 187 | 14 | 70 |
| " Diligence | 98 | 10 | 34 |
| " South Carolina .. | 98 | 10 | 34 |

When it was determined, in 1798, to extend hostile operations against France, to the waters of the West Indies, four fleets, under Commodores Barry, Truxton, Tingey, and Decatur, U. S. N., comprising in all some 20 national vessels, were formed to prey upon French commerce and destroy that nation's privateers, the above named vessels of the revenue cutter service were placed in co-operation with the navy, and sailed with the fleets, and in the summer and fall of 1799 did fine service. It was during this war that the frigate *Constellation*, under Commodore Truxton, captured the French frigates *Insurgent*, 40 guns, and *Vengeance*, 44 guns. During the naval operations against France 22 vessels, privateer and other, under the French flag, were captured, and of these 16 were made prizes by the revenue cutters, unaided, while they assisted in the capture of two others.

The Slave Trade.—Under the provisions of law inhibiting the slave trade, between the United States and foreign countries, the revenue cutter service, in common with the navy, took an active part in its suppression, and in the course of its work captured many slavers and liberated an aggregate of 487 negroes.

The War of 1812.—The well-known causes which led up to the War of 1812 between the United States and Great Britain need not be re-told here. But, for the enforcement of the embargo laws of 1807, Congress by the Act of 6 Jan. 1809, and another enactment of the same date, made provision for additions to the fleet of revenue cutters of 42 vessels. Following the proclamation of the President ordering all British armed vessels to leave the ports of the United States, and laying the first embargo in December 1807, to the close of the War of 1812, which ensued, the service bore an honorable and conspicuous part. Numerous and varied duties in the enforcement of the embargo laws up to the date of their repeal, and subsequently the non-intercourse act, fell

to the revenue cutter service until the declaration of war, 4 June 1812, when the service entered upon an active career, to capture, burn, sink, and destroy the commerce of the enemy in co-operation with the navy. The first prize in that war was the British trading schooner *Patriot*, with a valuable cargo, and was captured by the revenue cutter *Jefferson*, Capt. William Ham, 25 June 1812, just 21 days after the declaration of war.

Following this the cutters *Madison* and *Galatin* made valuable prizes. The British privateer *Dart*, 14 guns, had been for some time cruising and committing depredations on our coast near Newport, R. I. On 4 Oct. 1813, the revenue cutter *Vigilant*, Capt. John Cahoon, having augmented his crew by a draft of some 20 men from the United States frigate *President*, Commodore John Rogers commanding, sailed from Newport in pursuit. Soon after coming up with the enemy he carried him by boarding and conveyed the prize and prisoners to Newport.

One of the most notable actions fought upon the water in the War of 1812 took place in York River, near Chesapeake Bay, on the night of 12 June 1813, between the cutter *Surveyor*, commanded by Capt. William Travis, and forces from the British man-of-war *Narcissus*. The *Surveyor* carried 15 men and was armed with six 12-pounder carronades. The attack was made upon this little vessel by the barges of the British frigate *Narcissus*, which carried to the conflict 50 men, commanded by Lieut. John Crerie. The enemy was discovered by Travis when within 150 yards of the cutter, but the latter's guns could not be brought to bear, so that the defense was necessarily confined to small arms. To each of the *Surveyor*'s crew was given two muskets, with instructions not to fire until the enemy were within pistol range. The engagement was of brief duration, and the enemy by dint of superior force carried the cutter by boarding, with loss of three killed and seven wounded, while of the crew of the *Surveyor* five were wounded and the rest made prisoners of war. On the day following this action the British commander returned Capt. Travis' sword with the following letter:

His Majesty's Ship *Narcissus*,

June 13, 1813.

Sir:—Your gallant and desperate attempt to defend your vessel against more than double your number, on the night of the 12th inst., excited such admiration on the part of your opponents as I have seldom witnessed, and induced me to return you the sword you had so nobly used, in testimony of mine. Our poor fellows have severely suffered, occasioned chiefly, if not solely, by the precautions you had taken to prevent surprise; in short, I am at a loss which to admire most, the previous engagement on board the *Surveyor*, or the determined manner by which her deck was disputed, inch by inch. I am sir, with much respect,

JOHN CRERIE.

Captain S. Travis, U. S. cutter *Surveyor*.

The lack of space forbids detailed mention of many other incidents to the credit of the service in the War of 1812. But mention is made of the defense of the cutter *Eagle* in Long Island Sound, pursued by the British frigate *Pomone*, 44 guns, and gun brig *Despatch*, 18 guns, and a sloop. The *Eagle* was commanded by Capt. Frederick Lee, R.C.S. On 14 Oct. 1814 the enemy was discovered. Lee, to escape, ran his vessel ashore near Negro Head, Long Island, stripped it of sails and guns, dragged the latter

REVENUE CUTTER SERVICE

onto the bluff, and there the enemy was fought from 9 A.M. until late in the afternoon. When Lee had exhausted his shot and fixed ammunition, he tore up his logbook, made cartridges and returned the enemy's fire. Near nightfall the enemy withdrew and the next day Lee succeeded in floating his vessel and was about getting under way when the enemy returned in force, and this time secured the prize. During this engagement the Eagle's colors were shot away three times, and as often replaced by volunteers from her crew.

During this war the revenue cutter service captured 10 merchantmen, 3 barges, 3 officers and 60 men; 1 privateer mounting 14 guns. The cutters Eagle, Mercury, and Active did duty as scouts and on blockade service.

The cutters Commodore Barry, Surveyor and Eagle were captured by the enemy, but after a hard struggle and most gallant defense.

Neutrality Laws.—The enforcement of the neutrality laws, during the European troubles from 1815 to 1823, engaged much of the attention of the service, but this duty has always been a part of the vigilant work of the service, and is no less true of the earlier years than in the operations of later times.

Nullification, 1832.—During the attempt to nullify the laws relating to the collection of revenue from impost, by the State of South Carolina, five vessels of the revenue cutter service were ordered to Charleston harbor, with instructions "to take possession of any vessel arriving from a foreign port, and defend her against any attempt to dispossess the customs officers of her custody until all the requirements of the law had been complied with."

The silent influence exerted by the presence of this fleet was a large factor in the solution of the difficulties which menaced peace.

Piracy.—During the early years of the last century, piracy which prevailed along the Gulf coast of our possessions acquired from France and Spain, was suppressed, chiefly by the revenue cutter service. That service waged relentless war upon the corsairs, pursued them into every bay and bayou, broke up their resorts and rendezvous, attacked and dispersed them whenever found. While engaged in this work the cutters Louisiana and Alabama were attacked off the south coast of Florida by the pirate Bravo, commanded by Jean La Farge, a lieutenant of the notorious Jean Lafitte. The Bravo was signally defeated, and carried by boarding in a hand-to-hand struggle. The rendezvous of the pirates on Breton's Island, La., was attacked by the cutters Alabama, Capt. Cartigan, and Louisiana, Capt. Loomis, and the resort broken up. This practically put an end to organized piracy on our Gulf coast, though piratical craft from Mexico, Central America and South America, subsequently made incursions on that coast. The pirate Bolivia with its prizes Antoinette and Isabella were found by the cutter Louisiana, Capt. Jackson, at the South West Pass of the Mississippi River. Jackson attacked at once, captured the Bolivia and liberated the prizes, and carried his prisoners to New Orleans. The Bolivia carried 3 guns and 34 men; the cutter Louisiana 2 guns and 16 men.

Seminole War, 1836-42.—During the Florida war for the suppression of Indian troubles

in that region, the revenue cutters Dallas, Washington, Dexter, Jefferson, Jackson, Madison, Campbell and Van Buren rendered valuable and conspicuous service in Florida waters, co-operating principally with the army. Their services were so important and efficient as to induce from the officers under whose direction they operated the following:

Their prompt and helpful cooperation with the army has called forth the highest commendation from commanding generals, who take occasion to eulogize the services rendered by the cutters.

There were numerous instances of gallant and meritorious services by the officers and men of the revenue cutter service in this war, but the scope of this article forbids more than mention of the fact.

The Mexican War, 1845-7.—The revenue cutter service was represented in this war by the following named cutters: Schooners Forward, Ewing, Van Buren, Wolcott, Woodbury, Morris, and steamers McLane, Legare, Spencer, Bibb and Polk. They took an active part principally in co-operation with the armies under Scott and Taylor.

Some of these vessels, notably the Forward and McLane, served in co-operation with the navy, in the fleet commanded by Commodore Conner. In the squadron of Commodore M. C. Perry, at the capture of Frontera and Tabasco, the Forward took a brilliant part, so much so that the Commodore was moved to say in his official report: "I am gratified to bear witness to the valuable services of the revenue schooner Forward, commanded by Capt. H. B. Nones, and to the skill and gallantry of her officers and men."

The records of the time are replete with incidents of gallant services by the revenue cutter service in the war with Mexico, but the fact can only be stated here.

Paraguay Expedition.—In the naval expedition to Paraguay, in 1858, the purpose of which is matter of history, the steam revenue cutter Harriet Lane, 7 guns, 8 officers and 104 men, served in co-operation with the navy, and rendered valuable services. In acknowledgment of it the Secretary of the Navy wrote:

This department in closing its official connection with Captain Faunce (the commander of the Harriet Lane), is happy to express to you its satisfaction at the prompt, energetic and able manner in which he has conducted his command whilst in its service.

Winter Cruising.—The Act of Congress, approved 22 Dec. 1837, now embodied in Section 1536, Revised Statutes, requires that a suitable number of public vessels shall cruise upon the coast in the severe portion of the winter weather to afford aid to distressed navigators. The work outlined in the law has always been effectively performed by the revenue cutter service, and from 1 December to 1 April of every year the patrol of the coast from West Quaddy Head, Maine, to Cape Fear, N. C., is energetically maintained. As a result of the work many hundreds of lives and many million dollars' worth of property have been saved. Vessels of commerce are frequently fallen in with at sea, with sails blown away, crews frost-bitten, and unable to respond to duty; they are taken in tow and to a harbor; others short of provisions and water are supplied, while others again, found stranded, are floated when possible. In short, everything

REVENUE CUTTER SERVICE

possible is done for the relief and care of the distressed mariner of whatever nationality wherever found, during the hard weather on our storm-driven coast from December to April, and prompt response is always made by the service at the cry of distress at all seasons and all hours.

In the Life-saving Service.—This is an outgrowth of the revenue cutter service, as it formed part of the division of revenue cutter service prior to its organization as a separate service under the act approved 18 June 1878. From its inception in 1848 all stations have been constructed and equipped under the supervision of officers of the revenue cutter service assigned for the purpose. When this service was separated from the revenue cutter service by the act referred to, provision was made for the inspection, drilling, and disciplining of the crews of life-saving stations by officers of the revenue cutter service, and there are at this time (April, 1904) 14 officers of the revenue cutter service on duty in connection with that service. It may fairly be said that the efficiency of the life-saving service in all that relates to its technical features, is due to the energetic and capable officers of the revenue cutter service, who have made the inspections, formulated the drills, practised and drilled the crews of that service. As a matter of course, the able central management of the general superintendent, Sumner I. Kimball, is recognized to the full measure.

In the Civil War, 1861-5.—The service was conspicuous and valuable throughout this period. The limits of this article forbid any detail of duty performed during that trying period. It must therefore suffice to say in the main that from the attempted relief of Sumter in April 1861, to the close of hostilities in 1865, the service was at the front.

The Harriet Lane co-operated with the navy at the capture of the fortifications at Hatteras Inlet; the Forward rendered support and assistance to Gen. Butler at Annapolis, Md.; the Miami covered the landing of troops at Lynn Haven Bay for the recapture of Norfolk; the cutter Naugatuck took part in the attack on Sewell's Point, led the naval fleet up the James River and participated in the bombardment of Drewry's Bluff 15 May 1862; the Nemaha rendered efficient aid to the army and navy on the South Atlantic coast, received on board Gen. Sherman at Fort McAllister, Savannah, Georgia, just from his "march to the sea," and conveyed him to the naval fleet below. The Forward, Brown, Agassiz, Toucy, and Antietam rendered important service in the waters of North Carolina, while the Jackson, Hercules, Reliance, Tiger, and Allen performed excellent service in the Chesapeake, co-operating with the naval forces in the gunboat flotilla in those waters.

In Peace from 1867 to 1898.—The service is always active, always ready for work. Its achievements have been numerous and varied during times of peace, and honorable, often heroic in both peace and war. It blazed the way to and through Alaska, and for many years from the date of the acquisition of that territory in 1867, except for the occasional visit of a naval vessel, was the only service to exercise authority or to display the national emblem in the waters of that coast from Sitka to Bering

Sea, and the Arctic Ocean to Point Barrow. It is on guard in the waters of Alaska from early in May until late in December of every year, rendering aid to shipping, caring for the shipwrecked, and assisting to their homes the unfortunate and the destitute. Its surgeons yearly prescribe for and as far as possible aid the sick, and hardly a year goes by in which more than a thousand cases are not treated or relieved by the medical officers of our cutters in Alaskan waters. In these waters alone the service has rescued and brought home from the Arctic Circle hundreds of shipwrecked whalers, and others, who, but for the timely aid of the service, must have perished.

The memorable cruise of the cutter Bear in the winter of 1897-8, for the relief of whalers in the Arctic Ocean, was performed by officers of the revenue cutter service. The overland expedition from that ship, composed of Lieut. D. H. Jarvis, Lieut. E. P. Bertholf and Surgeon Samuel J. Call, was landed on Nunivak Island, in Bering Sea, in the dead of an Arctic winter, and from that point commenced a wearying march through the snow-covered, ice-bound region that lay between them and their destination, nearly 2,000 miles. Starting on 17 Dec. 1897 they reached their destination on 29 March 1898, taking with them a herd of reindeer as food for the crews of whalers congregated there, and the cheering news that the Bear would arrive with an abundance of food and clothing and to rescue those left and take them to civilization.

On the arrival at Point Barrow Jarvis and his party found terrible conditions confronting, but they set to work with the indomitable energy characteristic of the men, brought order out of chaos, and when the Bear arrived on 29 July following, 97 men were taken on board and conveyed to San Francisco. Of the officers and men who composed the Bear expedition, every one was a volunteer, from the commanding officer, Capt. Francis Tuttle, R.C.S., down.

In the Spanish-American War, 1898.—From the manifold duties in time of peace, the service enters always upon the war stage when duty calls. So in this case, as in all other wars of the nation. Hardly had the tocsin sounded when the revenue steamer McCulloch, bound for San Francisco, was overhauled at Singapore, by cable, directing her to report at Hong Kong to Commodore Dewey, commanding the Asiatic fleet. The ship made a quick run to Hong Kong, joined Dewey, and accompanied him in his Manila campaign, performed fine service, and brought to a waiting world the first news wired from Hong Kong of the victory of Manila Bay. That ship, the McCulloch, remained with Dewey until November following.

In reporting to the Secretary of the Navy, Dewey addressed the following letters:

United States Naval Force on Asiatic Station,
Flagship Olympia,
Cavite, Philippine Islands, June 12, 1898.
The Secretary of the Navy, Washington, D. C.

Sir:

1. I take pleasure in bringing to the attention of the Department the zeal and efficiency of Capt. Daniel B. Hodgson, R.C.S., commanding the McCulloch, while serving in the squadron under my command.

2. The McCulloch steamed from Hong Kong to Manila Bay in the squadron formation and ran the batteries at the entrance with the squadron, and while not placed in the line of battle at the battle of Manila Bay,

REVENUE CUTTER SERVICE

was kept near by and in readiness to assist any vessel that might be disabled.

3. Since joining my command and up to the time of his detachment Captain Hodgson has kept the McCulloch in a high state of efficiency and ready to move at a moment's notice and made her a valuable auxiliary to the squadron.

4. I request that the Department will communicate this report to the honorable Secretary of the Treasury.

I have the honor to be, very respectfully,

GEORGE DEWEY,
*Rear-Admiral, United States Navy,
Commanding United States Naval Force on Asiatic Station.*

And again, upon the occasion of the detachment of the McCulloch from his command, as follows:

United States Naval Force on Asiatic Station,
Flagship Olympia,
Cavite, Philippine Islands, Nov. 11, 1898.

The Secretary of the Navy:

Sir:

1. On the occasion of the U. S. revenue cutter McCulloch being detached from my command, I have again the honor to request that you will convey to the Treasury Department my appreciation of her valuable services while attached to the squadron under my command.

2. I have already had the pleasure of bringing this to the attention of the Department, at the time Captain Hodgson was detached, and now beg to state that all duty assigned to the McCulloch while under Captain Hooper was performed with the greatest zeal, efficiency, and judgment.

I have the honor to be, very respectfully,

GEORGE DEWEY,
*Rear-Admiral, United States Navy,
Commanding United States Naval Force on Asiatic Station.*

At the battle of Cardenas, 11 May, the revenue cutter Hudson, Lieut. Frank H. Newcomb, R.C.S., commanding, sustained the fight against the gunboats and shore batteries of the enemy, side by side with the naval torpedo-boat Winslow, and when Ensign Bagley and half the crew of the latter-named vessel had been killed and her commander wounded, rescued from certain destruction the vessel and the balance of the crew, under the furious fire of the enemy's guns. This gallant action was recognized by the honorable Secretary of the Navy as follows:

Navy Department,
Washington, D. C., June 15, 1898.

The Secretary of the Treasury.

Sir:—I have the honor to acknowledge the receipt of your letter of the 9th instant, and to forward herewith a copy of the report requested. I regret that inadvertently a copy of this letter was not forwarded to you immediately after it was received.

The rescue of the Winslow by the Hudson was so gallantly done, in the face of a most galling fire, that First Lieutenant Frank H. Newcomb, R.C.S., commanding, his officers and men, deserve the warmest commendation. The Winslow was riddled with shell, disabled, helplessly drifting on to the beach into the hands of the enemy, her captain wounded, her only other officer and half of her crew killed, but the Hudson courageously remained by her in the very centre of the hottest fire of the action, although in constant danger of going ashore on account of the shallow water, until finally a line was made fast to the Winslow, and that vessel towed out of range of the enemy's guns.

Very respectfully,

JOHN D. LONG,
Secretary of the Navy.

President McKinley made the work of the McCulloch and Hudson the subject of a special message to Congress, in terms of high commendation and praise, and as a reward of merit in the case of Hodgson of the McCulloch (there being no higher grade in the revenue cutter service to which he could be promoted) that

he be retired from active service on the full pay of his grade, and in recognition of the heroic gallantry noted in the letter of the Secretary of the Navy, the bestowal of a gold medal of honor upon Lieut. Newcomb, of the Hudson, and silver medals of honor to each of his officers, and bronze medals to each of his crew.

It will be noted that the only gold and silver medals bestowed by Congress for services in this war, were those for officers of the revenue cutter service.

There were in co-operation with the navy during this war, 13 revenue cutters carrying 61 guns, 98 officers and 562 enlisted men. Of these eight cutters (43 guns), 58 officers and 339 men were in Rear-Admiral Sampson's fleet and on the Havana blockade. One cutter, 6 guns, 10 officers and 95 men in Dewey's fleet, and 4 cutters, 12 guns, 30 officers and 128 men co-operated with the navy on the Pacific coast. Three other cutters, with 25 officers and 210 men, were ordered into co-operation, but the war closed before they were equipped or could get to the front.

There were in active co-operation with the army and navy together in all 20 cutters, carrying 71 guns, 131 officers and 725 men.

The services performed by the vessels of the revenue cutter service in co-operation with the navy during this war have been acknowledged in proper terms by the officers commanding the fleets with which they served.

Duties and General Features.—The cutter service, under the provisions of Section 2752, Revised Statutes, is purely a technical service, in that no person not trained in the technical profession of the sea can hold a commission in its ranks, and under regulations prescribed in conformity with the law referred to, all officers are required to pass rigid professional examinations for entrance and promotion.

The commissions of its officers are of the same (life) tenure as those of officers of the army, navy, and marine corps. Officers enter this, as they do the services named, in the lowest grades and work their way, by promotion, through long years of service (after examination, mental and physical) to the highest.

The revenue cutter service has always been, since the foundation of the government, constantly regarded and treated as a part of the military force of the country. Its vessels are armed cruisers, officered by men bearing the commissions (under military titles, captains, lieutenants, chief engineers, etc.) of the President, by and with the advice and consent of the Senate, and manned by duly enlisted men; its officers and men are uniformed in accordance with the regulations prescribed by the department; naval discipline and routine prevail on board of all its ships; the officers and crew are required to be proficient in naval drills, and to possess a practical knowledge of the use of arms. The service is required by law not only to aid in the protection of the revenue, but to enforce nearly every statute affecting the maritime interests of the country. By acts of Congress the service is required to aid in the enforcement of the quarantine laws, and in preventing the violation of the neutrality laws; to suppress mutinies on board merchant vessels, and to use the armament of their ships and the force on board when necessary to compel compliance.

REVERE

Under the definite provisions of the Act approved 12 April 1902 all officers of this service are invested with military rank, and are placed upon the same level with officers of the army as to pay and allowances, increase of pay for length of service, retirement on account of physical disability, or upon reaching the age of 64 years.

By law (Section 2757, Revised Statutes) the President may, by a simple order, require the service, or any part of it, to co-operate with the navy, when it at once becomes part and parcel of the naval force of the country, and passes from the jurisdiction of the Treasury Department to the control of the Navy Department. The service is, therefore, a part of the regular armed force of the country, identical in character with the naval service, and may at any time, in peace or in war, be made one by executive order.

Organization, Appointments, Promotions.—The number of commissioned officers authorized upon the active list is as follows:

Of the line: 37 captains, 37 first, 37 second and 37 third lieutenants.

Of engineer officers: 1 captain of engineers, who is also the engineer-in-chief, with the rank of captain of the line; 35 chief engineers, with the rank of first lieutenants; 17 first and 18 second assistant engineers, with the rank of second and third lieutenants, respectively, and 1 constructor with the rank of first lieutenant.

There are at this time (April 1904) 45 officers of all grades on the retired list.

Entrance to the service (line) is confined to graduates of the School of Instruction, United States Revenue Cutter Service, to which young men are appointed after physical and mental examinations, as cadets, serving a probationary term of three years. They are, at graduation, commissioned as third lieutenants, and at every promotion thereafter must pass a satisfactory mental and physical examination.

Entrance as engineer officers. The candidate must pass on a high standard, a satisfactory examination, mental and physical, and is then commissioned in the lowest grade, second assistant engineer. Promotions are only gained after rigid examination and record for efficiency.

The enlisted force of the service numbers about 1,250 men.

There are in the fleet 11 cruisers of tonnage from 588 to 985 (gross); 13 cruisers, tonnage from 330 to 416; 13 harbor vessels and launches, and one sailing bark, practice ship for cadets.

Previous to 1889 the chiefs of the service were civilians, and the consulting engineer was employed from the outside. In that year Capt. L. G. Shepard, R.C.S., was assigned as chief, and Chief Engineer J. W. Collins, R.C.S., as engineer-in-chief. Subsequently, by enactment of Congress, the chief of the service must be a captain, while the captain of engineers is assigned as engineer-in-chief. Upon the death of Capt. L. G. Shepard in March 1895 he was succeeded by the writer.

The following table will show the work of nine years (1895 to 1903) in the performance of ordinary duty:

| | |
|---|--------------|
| Vessels in distress assisted..... | 736 |
| Value of vessels and cargoes..... | \$19,371,505 |
| Persons on board vessels assisted..... | 10,349 |
| Lives actually saved | 820 |

C. F. SHOEMAKER,

Captain, U. S. R. C. S., Chief Revenue Cutter Service.

Revere, rē-vēr', Joseph Warren, American military officer: b. Boston, Mass., 17 May 1812; d. Hoboken, N. J., 20 April 1880. He entered the navy as midshipman in 1828, attained the rank of lieutenant in 1841, served in the Mexican War, and in 1850 resigned from the navy. At the outbreak of the Civil War he was appointed colonel of volunteers in the army, and in 1862 was promoted brigadier-general. He commanded a brigade at Fredericksburg and was engaged at Chancellorsville. For his conduct in the latter battle he was censured by his superior officer, tried by court-martial, and dismissed from the service in 1863. The decision was revoked by President Lincoln, and Revere then resigned. He published 'Keel and Saddle' (1872).

Revere (French, RIVOIRE), Paul, American patriot: b. Boston, Mass., 1 Jan. 1735; d. there 10 May 1818. He was trained as a gold- and silver-smith, and was skilful in the engraving of designs for silver plate. In 1756 he participated in the expedition for the capture of Crown Point, upon his return from which he set up as a goldsmith, and also practised copper-plate engraving. Among his prints were a likeness of Samuel Adams, a portrait of King Philip, a view of Castle William, and the Boston Massacre. He also engraved the plates for the earliest paper currency of Massachusetts. In 1774 he was one of the grand jurors who refused to serve in consequence of the act of parliament making supreme court justices independent of the legislature as regards salary. In the autumn of that year he became one of the "thirty North-end mechanics," who patrolled the Boston streets to watch the movements of the British forces. On 14 April 1775 this committee of observation noted preparations in barracks and on board ship on the part of the British. On the evening of the 18th it was seen that troops were marching across the common to the inner bay. Revere forthwith had a preconcerted signal set in a Northend church tower—the honor being claimed for Christ Church and for the church in North Square destroyed by the British—crossed the river, mounted a horse on the Charlestown side, and began his famous "midnight ride." He was none too early, for at 2.30 800 British troops were landed at Lechmere Point and marched on Lexington. Revere became the trusted special messenger of the committee of safety, and after the evacuation of Boston was made successively major and lieutenant-colonel of a regiment of artillery. He took part in the Penobscot expedition in 1779. After the Revolution he resumed as gold- and silver-smith, built a bell- and cannon-foundry, and in 1801 established large copper-rolling works at Canton, Mass. It is said that he was the first in America to smelt copper ore, and to refine and roll copper into sheets and bolts. He

was conspicuously associated with benevolent enterprises. Longfellow's poem, 'The Midnight Ride of Paul Revere,' in which, says Winsor, the author has "paid little attention to exactness of fact," is well known.

Revere, Mass., town in Suffolk County; on the Atlantic coast, and on the Boston & M., the Boston, R. B. and Lynn R.R.'s; five miles northeast of Boston. The place was settled in 1627, and was first named Rumney Marsh. Until 1738 it was a part of Boston. In 1739 it was incorporated as Chelsea, and in 1846 was set off and reincorporated as North Chelsea. In 1871 the name was changed to Revere, in honor of Paul Revere (q.v.). It is a popular residential town and a summer resort. It has a Massachusetts State Bath House, built and maintained by the State; Revere Town Hall, a memorial to Paul Revere; and a Carnegie Library. It has a number of churches and good public schools. The government is by annual town meeting; the administrative officials elected are five, who constitute a board of selectmen. Pop. (1890) 5,668; (1900) 10,395.

Reverberatory Furnace, a furnace in which the material is heated without coming into contact with the fuel. Between the fireplace and the bed on which the material to be heated lies a low partition wall, called a fire-bridge, is placed. The flame passes over this bridge, and plays down against the bed, being reflected or reverberated (whence the name) by a flat arch which surmounts the whole.

Reverend, a title of respect given to ministers of religion—in the United States to the clergymen of all religious denominations, including the Jewish Church: the titles very reverend, right reverend, and most reverend, are given to deans and vicars-general, bishops, and archbishops, respectively. A like usage prevails in England, but strict churchmen of the Establishment refuse to accord the title reverend to the clergymen of the dissenting churches. The Bishop of Lincoln in 1874 refused to allow this title to be inscribed on the tombstone of a Wesleyan minister, and his action was approved by judgment of the Arches court; but that judgment was reversed on appeal to the privy council, when the title was declared to be simply one of courtesy and not confined to clergymen of the Established Church. In Scotland the principals of the universities, if they be clergymen, and the moderator of the general assembly for the time being, are styled very reverend.

Reveries of a Bachelor, or A Book of the Heart, a collection of meditative papers by Donald Grant Mitchell, originally issued under the pseudonym, "Ik Marvel." The first 'Reverie' was published in the 'Southern Literary Messenger' in 1849, and reprinted the following year in 'Harper's New Monthly Magazine.' These papers, full of sentiment, enjoyed a wide popularity at the time of their appearance and still find favor with readers.

Reversion, in biology, the reappearance in an animal or plant of characteristics not of its parents, but of more remote ancestors. This frequently occurs in varieties of domesticated animals or of cultivated plants, which have been produced by artificial breeding, and which suddenly develop traits belonging to the wild stock. The more highly bred and artificial the variety

of animal or plant, the more liable is it to show this occasional reversion. That the tendency is strong and persistent appears from the fact that if the variety is not kept pure by careful breeding, as when a flower escapes from cultivation or a race of domestic animals runs wild, it soon begins to resume the characteristics of, or "revert toward," the wild stock from which it sprang. This reappearance of abnormal characters, as of color, markings, etc., is very likely to occur in the progeny resulting from the crossing of dissimilar races or species, which can be explained only on the supposition that such characters belonged to remote ancestors, perhaps thousands of generations removed. This was illustrated very forcibly by the experiments undertaken at Penycuik, in Wales, by Ewart, in the crossing of zebras with mares, the offspring of which exhibited many peculiarities belonging to neither parent. Under this head, also, will fall the strange phenomenon known to breeders as "throwing back," where a mother animal, which has previously been mated with a sire of another breed or race, will subsequently, when mated with a sire strictly of her own kind, will sometimes produce offspring showing characteristics of the earlier cross. Consult: Darwin, 'Variation of Animals and Plants Under Domestication' (London, 1888); Ewart, 'The Penycuik Experiments' (London, 1899); and the authorities cited under HEREDITY (q.v.).

Reversion, in law, the right to property which remains after some particular estate has ceased which has been granted by the owner. In the United States this is virtually the only meaning of the term in general usage. In England, where the purchase and holding of annuities is common, a reversion means the present right to a payment to be made at some future time, conditional upon certain contingencies, as in the case of an insurance falling to be paid on the attainment of a certain age, or on the death of the assured. The value of a reversion is easily ascertained when the date of its emergence is fixed, and thus a person who has a right to receive a certain sum of money at a given time is enabled to sell this right for its just value.

Reviews. See PERIODICAL LITERATURE.

Réville, râ-vêl, Albert, French Protestant theologian: b. Dieppe, France, 4 Nov. 1826. He was educated at Geneva and Strasburg, and was pastor of the Walloon Church at Rotterdam 1851-72. He then removed to Dieppe, where he spent his time in philosophical studies till called in 1880 to the chair of the history of religions in the Collège de France. He was one of the most radical French Protestants of his time, and among his numerous books are: 'Comparative History of Philosophy and Religion' (1859); 'Redemption' (1860); 'Essais de Critique religieuse' (1860); 'Theodore Parker, sa Vie et ses Œuvres' (1865); 'History of the Dogma of the Divinity of Jesus Christ' (1869); 'Introduction to the History of Religions' (1881); 'Histoire des Religions' (1883-9).

Revised Statutes of the United States, a compilation of all the acts of the Congress of the United States: it was first approved by Congress 22 June 1874, thus becoming law: at that time the compilation included all the laws enacted by Congress down to 1 Dec. 1873. The

second edition of the Revised Statutes comprised the first edition as amended by the 43d and 44th Congresses: supplements have since been approved and published containing later acts of Congress. The act approving the Revised Statutes makes that compilation the authentic and authoritative expression of the laws, without reference to the original acts: but the originals may be quoted to show the true intent of the lawmakers if there is any ambiguity in the compilation.

Revised Version, a revision of the Authorized Version (or King James' Version) of the Bible. The project of the revision originated in the Convocation of Canterbury, 1870, when two companies of biblical scholars of the Established Church, one to revise the Old Testament, the other the New, were appointed, with power "to invite the co-operation of any eminent for scholarship, to whatever nation or religious body they may belong." Afterward, under a resolution of the Convocation, two companies of American biblical scholars were formed, to act with the English companies. The work of revision, which was commenced 30 June 1870, was completed 20 June 1884; the New Testament was published in England and the United States in May 1881, and the Old Testament in May 1885. Many readings and renderings proposed by the American revisers were not approved by the English companies either for adoption into the text or the margin, but were ordered to be recorded at the end of the New Testament or the Old, respectively. But an edition of the whole Bible having the renderings preferred by the American companies and many other renderings since proposed by American scholars has been published in the United States and is known as the American Revision. See BIBLE.

Revival of Letters, a term used to designate the revival of literature after the apparent death blow which it received when the barbarous nations of the North destroyed the Roman empire. It commenced about the beginning of the 11th century, and became more potent in the 14th, 15th, and subsequent centuries.

Revival of Religion, a season of religious awakening out of spiritual torpor or indifference; usually brought about by the fervid exhortations of men deeply impressed with the feeling that the churches, the pastors, and the people have been slumbering while Satan has been gaining possession of the kingdom of Christ on earth. The term, revival of religion, is a modern one, but the thing it signifies is as old as Christianity, as old as Israelitism or as religion itself. The mission of every one of the Hebrew prophets was for the revival of religion; in the Christian Church, revivals, though not called by that name, occurred at intervals from apostolic times; and every sincere and enthusiastic reformer—Saint Peter Damiani, Saint Francis of Assisi, Saint Dominic, in the Middle Ages; the Jesuits, the Redemptorists, and other missionary orders; these were in their time revivalists in fact, though not in name. The Reformation is regarded by Protestants as a great awakening of the Christian consciousness, and the well-spring of all the efforts that have since been made for the renovation of the spiritual life in the Protestant churches. In England, at the beginning of the 17th century the

religion of the Established Church had degenerated into a cold but decent formalism, but a revival of spiritual interest in the common people was brought about through the instrumentality of the Puritans. After the restoration of the monarchy and of the State church there was a period of spiritual sloth and apathy, infidelity, and immorality, till in the 18th century Great Britain was aroused by the fervid preaching of the Wesleys, Whitefield, Rowland Hill, Romaine, Venn, Newton, Cecil, Fletcher, and others, earnest men who were raised up and qualified by the divine spirit for the work which lay before them. (See METHODISTS.) Simultaneously there was a similar great religious movement in the American colonies, especially New England and New York, called at the time the Great Awakening; it seems to have arisen independently of the movement in the parent country; but it was greatly quickened by the missionary labors of John Wesley and George Whitefield during their visits to the colonies. About the same time there was a remarkable revival of religion in various parts of Scotland, especially at Cambuslang and Kilsyth; and out of a similar awakening in Wales arose the Welsh Calvinistic Methodist Church. In 1839 Kilsyth was again the focus of a great revival of religion, which extended to Dundee, Perth, Blairgowrie, Ancrum, Jedburgh, Kelso, and, in the north of Scotland to Ross-shire and Sutherlandshire. In the first half of the 19th century there were many revivals in the United States, notable among which were those under Charles G. Finney (q.v.), who also visited Great Britain and preached to vast crowds in London and other cities; a notable feature of the great revival commenced in 1830 was the camp meetings (q.v.), assemblies of great numbers of people, held in the open air, and addressed by relays of evangelists from morning till night. In 1858 there was a great revival of religion in the United States, which subsequently extended to the British isles and even to the continent of Europe. Its principal centres at first were New York and Philadelphia, whence it spread throughout the States, producing for a time a sort of federation of the evangelical churches for the promotion of the work of spiritual conversion. In nearly every city in the land meetings for prayer were held daily, often in business hours, in churches, in counting houses, in theatres, and other places of public resort; in the one State of New York more than 2,000 cities, towns, or villages had an active part in this revival; throughout the country the interest in the movement was universal; daily reports of the deep religious feeling of the people were received at the principal centres and published in the newspapers. In New York every evangelical church received large accessions to its membership, and a like report was made concerning Boston, Baltimore, Washington, Chicago, Cincinnati, Pittsburg, and other cities. For nearly two years the meetings for prayer and the labors of the evangelists continued almost unflagging, and for many years noon-hour prayer-meetings continued to be held in the business centres of many of the cities. In the summer of 1859 the movement extended to the north of Ireland, where it was not less fruitful of spiritual good than in America; the people flocked to the services in the open-air

meetings or assembled in social gatherings for devotional exercises; there was a noticeable diminution of vice and immorality, especially of drunkenness; and judges and magistrates cordially recognized the reality and power of the spiritual work. From Ireland the revival spread to Scotland, and in Glasgow, Edinburgh, Aberdeen, Perth, Dundee, and the other considerable towns, the religious denominations joined in active exertions to bring the neglected poor within the range of evangelistic and educational agencies. It extended to Wales also, where in one year the increase in the membership of the Calvinistic Methodist body alone was 33,724 souls; the gain to the Independent denomination was 30,000, to the Established Church 20,000, and to the Wesleyan body 10,000. Hardly less notable was the revival initiated in Chicago by Dwight Lyman Moody (q.v.) and conducted by him in conjunction with Ira D. Sankey. These two evangelists—a preacher and a singer of the gospel—visited Great Britain in 1873, and for two years in the principal cities of England, Scotland, and Ireland their meetings were attended by multitudes from all ranks of society, and their labors zealously seconded by ministers of all the evangelical churches; thousands of persons professed conversion, and there was a manifest religious awakening. The two evangelists on their return home engaged in revival work of the same kind in the American cities; and they subsequently made two visits to Great Britain, namely, 1883-4 and 1891-2. The Salvation Army (q.v.) and the Volunteers of America (q.v.) are agencies designed to promote a continuous revival of religion, especially among the poor and neglected classes.

Revivals, Religious, seasons at which by extraordinary efforts in preaching, prayer, and hymn-singing, Protestant ministers, especially among the Methodists, seek to arouse the religious feelings and deepen the religious convictions of their hearers. While Protestant revivals were held in England and the United States early in the 18th century, similar movements had taken place previously both in Scotland and Ireland. John Wesley appears to have been the first to develop this method of evangelization into a permanent institution. But in the colony of Massachusetts Jonathan Edwards successfully carried on revivals at Northampton in 1734. George Whitefield was instrumental in extending the movement on his arrival in America (1739), although Gilbert Tennant had previously begun the work in New Jersey. The Great Awakening, as this extended movement was called, occurred between 1740 and 1742, but its quickening results were felt long after and inspired the multiplication of colleges and churches. In the West and South the revival, technically so called, took the form of a camp meeting (q.v.), and these open air gatherings are still made an instrument of evangelization and conversion by the Methodist Church. Out of the camp meeting sprang the Chautauqua Assembly (q.v.), an institution at once educational and religious. Consult: Porter, 'Letters on Religious Revivals' (1850); Starbuck, 'Psychology of Religion' (1900); James, 'Varieties of Religious Experience' (1902).

Revocation of the Edict of Nantes. See EDICT OF NANTES.

Revolution, a term commonly used to designate a fundamental change in government, or in the political constitution of a country, effected suddenly and violently, and mainly brought about by internal causes; a revolt against the constituted authority successfully and completely accomplished. In the United States the term Revolution is applied specifically to the American War for Independence, which began in 1775 with the irregular running fight popularly known as the battle of Lexington, and practically ended with the surrender of Lord Cornwallis, at Yorktown, Va., to the combined forces of the French and Americans, 19 Oct. 1781. By this war the colonies succeeded in casting off the English authority and in erecting the government of the United States. The English revolution was that revolution in England by which James II. was driven from the throne in 1688. See REBELLION.

In astronomy: (1) The motion of a planet around the sun, or of a satellite around a planet. The point to which it returns is called annual, anomalistic, nodical, sidereal, or tropical, according as it has a relation to the year, the anomaly, the nodes, the stars, or the tropics. (2) In geometry, when one line moves about a straight line, called the axis, in such a manner that every point of the moving line generates a circumference of a circle, whose plane is perpendicular to the axis, that motion is called revolution, and the surface is called the surface of revolution. Every plane through the axis is called a meridian plane, and the section which this plane cuts from the surface is called a meridian curve. Every surface of revolution can be generated by revolving one of its meridian curves about the axis. The revolution of an ellipse round its axis generates an ellipsoid; the revolution of a semicircle round the diameter generates a sphere; such solids are called solids of revolution.

Revolutionary Calendar, a calendar adopted during the French Reign of Terror. It was decreed on 24 Nov. 1793, to commence from the foundation of the French republic, 22 Sept. 1792. The 12 months were Vendémiaire, Brumaire, Frimaire, Nivose, Pluviose, Ventose, Germinal, Floréal, Prairial, Messidor, Fervidor or Thermidor, and Fructidor. The first three constituted autumn, the second three winter, the third spring, and the fourth three summer. Napoleon I. restored the old system, 31 Dec. 1805.

Revolutionary Tribunal. A court of extraordinary criminal jurisdiction established by the French Convention, 10 March 1793, for the purpose of trying those accused of plotting "against the liberty, equality, unity, and indivisibility of the Republic, the internal and external safety of the state, or the sovereignty of the people." It received the name Revolutionary Tribunal in October 1793. The court was to consist of a jury and a public prosecutor with two assistants, all named by the Convention, and from its decision there was no appeal. The number of judges rose as high as 80 toward the end of the tribunal's existence. Intended as a means of combating treason at home, the Revolutionary Tribunal speedily became an instrument in the hands of the Committee of Public Safety, whose will it executed under the guise of judicial form. Without any definite pro-

cedure, with no legal defenders allowed to the accused, and with its acceptance of the vaguest rumors and charges as evidence, the tribunal offered but a mockery of justice and citation before it almost invariably meant death. The reading of the act of accusations, the trial, and the execution of the sentence generally occurred on the same day. The tribunal sent 1,220 victims to the guillotine from its inception till June 1794, when Robespierre (q.v.) caused the infamous law to be enacted accelerating its procedure; from that date to the fall of Robespierre, a period of about 50 days, it condemned 1,376 persons, Robespierre and his followers being among the lot. The tribunal soon after ceased its functions and was formally suppressed 31 May 1795. Its sanguinary work must be regarded as justified to a large extent by its success in saving the country from sedition at home at a time of great national danger. It was but one feature of the organized Terror which saved France from foreign conquest. Consult: Wallon, 'Histoire du Tribunal Révolutionnaire de Paris' (1880-2).

Revolutionary War. See UNITED STATES: AMERICAN REVOLUTION.

Revue Des Deux Mondes ("Review of the Two Worlds"), a noted French bi-monthly publication, which includes among its contributors the highest authorities in French literature and art, and whose criticisms have weight in every civilized land. It was founded by F. Buloz in 1831, and its present conductor is M. Brunetière.

Rewa, rā'wā, India, (1) the capital of a native state of the same name 131 miles southwest of Allahabad, and connected by a branch line with Sutna on the East India Railway. It is enclosed by three wall circuits or ramparts, the outer one massive, and flanked by round towers. Its chief buildings and institutions are the fortified palace of the maharajah, a high school, hospitals, and a model jail. Pop. 24,000. (2) The native state in the Central India Agency, and in the sub-agency of Baghelkand (q.v.), has an area of 12,676 square miles. It is chiefly an elevated table-land, but also comprises portions of the country on both sides of the Kaimor Hills, watered by the Son, a tributary to the Ganges, and flowing northeast. The surface is in part covered with jungle, but on the whole highly cultivated; the condition of the peasantry is, however, much depressed. The ruins of many temples are scattered over the country. The revenue of the maharajah amounts to about \$1,250,000 annually; the armed force consists usually of 4,000 men, though from 10,000 to 12,000 might be mustered. Pop. (1901) 1,509,454.

Rewa Kantha, kân'tū or -ta, India, a political agency under the government of Bombay, containing 61 small states, of which five are tributary to the British government, and most of the remainder to Baroda. The territory included, covering an area of 4,980 square miles, with a pop. (1901) 478,880, lies mainly along the south bank of the lower Nerbudda with patches north of it, and on the western borders of Broach, Baroda, and Ahmadabad.

Reward, in a legal sense, some encouragement which the law holds out for exertions in

bringing certain classes of criminals to justice. The courts may order the sheriff of the county, in which certain offenses have been committed, to pay to persons who have been active in securing the apprehension of offenders charged with murder, or with feloniously shooting, cutting, stabbing, wounding, or poisoning, or with rape, burglary, housebreaking, robbery, arson, or cattle stealing or with being accessory before the fact to any of such offenses, or to receiving any stolen property, a reasonable sum to compensate them for expense, exertion, and loss of time. So by a later statute courts are authorized, in the case of any of the above offenses which they have jurisdiction to try, to order such compensation; but the payment to one person must not exceed \$25. If any one is killed in endeavoring to apprehend a person charged with one of these offenses, the court may order compensation to be made to the family. The amount to be paid in all such cases is subject to regulations which may be made from time to time by the secretary of state. By another statute it is a felony, punishable by penal servitude to the extent of seven years, to corruptly take any reward for helping a person to property stolen or embezzled, unless all due diligence to bring the offenders to trial has been used. In Great Britain an advertisement offering a reward for the return of stolen or lost property, using words purporting that no questions will be asked or inquiry made after the person producing the property, renders the advertiser, printer, and publisher liable to forfeit \$250.

Rewbell, rē-bēl, Jean François, French statesman: b. Colmar 8 Oct. 1747; d. there 23 Nov. 1807. He was a prominent advocate of Colmar, and was elected to the States-General of 1789, where he advocated the principles of the Revolution. He was a member of the Constituent Assembly, where his boldness and legal knowledge made him president in 1791. As a member of the Convention, in 1792 he was outspoken in urging the condemnation of Louis XVI.; but his absence on a mission to the army at Mentz saved him from being numbered among the regicides. He helped suppress the Jacobin Club in 1794, figured as member of the committees of public safety and of general security; and on the adoption of the constitution in 1795 he became one of the five members of the Directory and took in charge the departments of finance, justice, and foreign affairs. In 1796 the Directory elected him its president. He succeeded in defending himself from conviction on charges of peculation, but retired from public life after the *coup d'état* of the 18th Brumaire (9 Nov. 1799) and carried with him a large fortune. Consult Sciout, 'Le Directoire' (1895-7).

Rexford, Eben Eugene, American writer: b. Johnsburg, N. Y., 16 July 1848. He was educated at Lawrence University, Appleton, Wis., and began to write for the press at 14. He has published: 'Brother and Lover,' verse (1886); 'Grandmother's Garden,' verse (1887); 'John Fielding and His Enemy' (1888); 'The Swamp Secret' (1897); 'Flowers: How to Grow Them' (1898); 'Into the Light' (1899); etc. He wrote the popular songs, 'Silver Threads Among the Gold' and 'Only a Pansy Blossom.'

Reyes, Rafael, officially proclaimed as president of Colombia 4 July, and inaugurated 7 Aug. 1904; an explorer, soldier, and statesman. For his discoveries, see *SOUTH AMERICA*, sub-title *Railways and Navigation*. Beside the public service rendered by him when he traveled during several years in unknown parts of the Amazon basin, the facts in his career which deserve special notice are the following: He was commander-in-chief of the Colombian army; was sent to Washington, after Colombia had lost Panamá, to "save whatever he could from the wreck"; and in this patriotic effort he was certainly not altogether unsuccessful, since he gained courage to advocate on his return to Bogotá, the policy indicated in the report which he submitted to his government. He advocated, sensibly, courageously, and magnanimously, a frank acknowledgment by his people of their own blundering which had contributed to the disaster; and he continued to show his people how the natural resources of the vast territory still remaining in their possession could be developed by attracting foreign capital. He succeeded. The very great, imperfectly defined powers of the presidency were entrusted to him, despite the old ultra conservatives' hostility to foreign enterprise, and despite the suicidal scheme of the liberals for permitting Colombia to be absorbed by Venezuela and Ecuador. His success saved Colombia from a future of isolation and stagnation, on the one hand, or, on the other hand, nearly complete loss of identity. President Amador of Panamá and President Reyes exchanged congratulatory messages in August, and the American minister was received at Bogotá in December 1904.

MARRION WILCOX.

Reykjavik, rik'yä'vîk. See REIKIAVIK.

Reynard (rā'nard or rēn'ard) the **Fox**, the name of an epic fable in which the characters are animals, the fox being the hero, and which in various forms was extremely popular during the Middle Ages, and for many years afterward. The latest version of the story, and that which indeed supplanted all the rest, is in the Low German dialect, and was printed at Lübeck in 1498 under the title of 'Reynke de Vos.' The author calls himself Henrik van Alkmer, schoolmaster and tutor to the Duke of Lorraine, but it is believed that this is merely a pseudonym, and that the real author was Hermann Barkhusen, town-clerk of Rostock, and printer there. The 'Reynke de Vos' is in verse, and founded on the oldest Flemish or Dutch redaction of the story in prose. It relates the adventures of the fox (Reynke) at the court of the king of beasts, the lion, and details with great spirit and humor the cunning modes in which the hero contrives to outwit his enemies, and to gain the favor of his credulous sovereign. The poem may be regarded, with Carlyle, as "a parody of human life." There is no personal satire in it, but the allusions to the weak points in the social, religious, and political life of the time are numerous and unmistakable. The fables of Æsop are one of the best known examples of the tendency to represent animals as talking and acting like human beings; but it appears that the beast-fable first took on an epic form among

the German races, especially the Franks, by whom it was carried to the Low Countries and the adjacent parts of France, where it took firm root. In the 10th and 11th centuries the monks of France gave a satirical and didactic turn to the fable, and some Latin poems in which it is so treated are still extant. In these much of the satire is aimed at the pope, the hierarchy, and the powerful Cistercian order. In the mouth of the Franco-Flemish people, however, the fable kept itself clear of such allusions, and soon took on a more purely epic form, aiming its satire at human failings in general. In 1170 the story in this more purely epic form appeared in Germany under the title of 'Isengrimes Nôt,' and somewhat later again in Flemish. In Germany the beast-fable could not maintain its ground side by side with the Swabian court poetry, and was soon given up; while the rhymed 'Reinaert' of the Low Countries, in accordance with an altered taste, was turned into a prose narrative, 'De Hystorie van Reinaert de Vos' (1479). This was soon after translated into English by Caxton, and printed by him at Westminster in 1481. The fable now returned once more to Germany, where the Low German version of Barkhusen took the place of all others. It was translated (1794) into German hexameters by Goethe, who called it the 'Unheilige Weltbibel,' in his 'Reineke Fuchs.' His translation has been turned into English heroic metre by T. J. Arnold (1870). Consult: Froude, 'Short Studies on Great Subjects' (1877-82); Thom's introduction to the Percy Society's edition of 'The History of Reynard the Fox' (1844); Ellis, 'History of Reynard the Fox' (1894); Jacobs, 'Reynard the Fox' (1895); Martin, 'Le roman de Renarte' (Strasbourg-Paris 1882-7); Potvin, 'Le roman du Renard' (Paris 1891).

Reynolds, rēn'olds, Edwin, American inventor: b. Mansfield, Conn., 23 March 1831. After obtaining a public school education he entered a machine shop as apprentice in 1847. He was superintendent of shops at Aurora, Ill., 1857-61, and was general superintendent of the Corliss Steam Engine Company, at Providence, R. I., in 1871-7. Later he became president of the Milwaukee Boiler Company, the Daisy Roller Mills Company, and the German American Bank. He invented the Reynolds-Corliss engine; introduced the first triple-expansion engine, the cross-compound hoisting engines for mining work, etc. Since 1877 he has been general superintendent of the Reliance Works at Milwaukee.

Reynolds, John Fulton, American military officer: b. Lancaster, Pa., 20 Sept. 1820; d. Gettysburg 1 July 1863. He was graduated from West Point in 1841, served in the Mexican War as first lieutenant and in 1855 was promoted captain. He was commandant at West Point in 1859-61 and at the outbreak of the Civil War he was appointed lieutenant-colonel of volunteers, receiving his commission as brigadier-general of volunteers in August of that year. He led a brigade in the Seven Days' battle in June 1862 and was brevetted colonel and brigadier-general in the regular army for gallant service. He was placed in command of the First Army Corps in 1863 and promoted major-general of volunteers. He participated in

the battle of Fredericksburg and commanded on the field of Gettysburg on 1 July until killed by a Confederate sharpshooter.

Reynolds, John Hamilton, English poet: b. Shrewsbury, Shropshire, 9 Sept. 1796; d. Node Hill, Isle of Wight, 15 Nov. 1852. He entered an insurance office, but evidently spent much of his time in writing poetry as in 1814 he published two volumes, 'Safie, an Eastern Tale,' and 'The Eden of Imagination,' the first after the style of Byron, and the latter after that of Wordsworth and Hunt. In 1818 he obtained a lucrative post in a solicitor's office, and later was for a time proprietor of the 'Athenæum.' In 1838 he removed to the Isle of Wight, where he became clerk of a county court. Of his numerous poems the best are published in 'The Garden of Florence, and Other Poems' (1821).

Reynolds, Joseph Jones, American military officer: b. Flemingsburg, Ky., 4 Jan. 1822; d. Washington, D. C., 25 Feb. 1899. He was graduated from West Point in 1843 and after service at Fort Monroe and in Texas was, in 1846, assigned to the 3d Artillery and was on frontier duty at Fort Washita, I. T., in 1855-6. He then resigned to become professor of mechanics and engineering at Washington University, Saint Louis. At the beginning of the Civil War he entered the Federal army as colonel of the 10th Indiana Volunteers, soon becoming major-general of volunteers. He was engaged in the battles of Chickamauga and Chattanooga; later was in command of the defenses of New Orleans from 6 January to 16 June 1864; and of the Mississippi River from its mouth to Memphis, Tenn., from October to December 1864. In 1866 he was mustered out of the volunteer service and promoted colonel in the regular army. He was brevetted brigadier-general in 1867, retiring from active service in June 1877.

Reynolds, Joseph Smith, American soldier and lawyer: b. New Lenox, Ill., 3 Dec. 1829. He was graduated at the University of Chicago in 1866, but had previously served through the Civil War in an Illinois regiment, participating in many battles, and being brevetted colonel and brigadier-general in July 1865. After the war he was admitted to the bar, sat in the Illinois legislature 1866-70, was one of the founders of the Chicago park systems, a member of the Chicago Board of Education 1870-4, and State senator 1872-4. He was senior vice-commander-in-chief of the G. A. R. 1875-6; commander of the Illinois Department of G. A. R. in 1877; and first vice-president of the Society of the Army of the Tennessee in 1879.

Reynolds, Sir Joshua, English portrait painter: b. Plympton, Devonshire, 16 July 1723; d. London 23 Feb. 1792. He was the son of Rev. Samuel Reynolds, master of the grammar school at Plympton St. Mary, Plymouth, who intended him for the medical profession; but Reynolds declared himself for art and went to London in 1741 and studied under Thomas Hudson. This painter was at the head of his profession at a time when there were no very shining lights and from him Reynolds acquired a correctness of drawing and a certain reflection of the style of Van Dyck that gave way subsequently, in great measure, to other influences. He returned to Devonshire after two years and painted portraits for small prices;

went again to London in 1745 and established himself as a painter, but the death of his father the following year recalled him to Plymouth. In 1749 he accompanied young Commodore Keppel, then sent on a mission to the Barbary states, to the Mediterranean and spent more than three years in Italy, mainly at Rome with visits to Florence, Bologna, Parma, Venice, and a short stay at Paris on his return to London. In Italy, he studied the Italian masters, especially in respect to their handling of light and shade. He learned from the Venetians much of their mastery of color, so that when he settled again in London in 1753 his work showed the influence of Correggio primarily with reminiscences of Tintoretto, Veronese, and Titian. In that year he painted a portrait of Commodore Keppel that lifted him at once into fame. This picture, now in the Grosvenor Gallery, is almost a monochrome in gray, with a few faint suggestions of color; but is remarkable for its effects of light and for individuality of portraiture. So popular did the young painter become that in 1755 120 persons sat to him for their portraits. His work, which is of such considerable extent, does not display a uniform excellence, since to produce it all he had to call in the assistance of journeymen. In 1768 he was made president of the Royal Academy upon its establishment; and the next year he delivered his first discourse to the students. His social success was commensurate with his fame as an artist; George III. knighted him and appointed him court painter in succession to Allan Ramsay. He lived on terms of intimacy with Dr. Johnson, Goldsmith, Burke, Gibbon, Garrick, and was the founder of the Literary Club in 1764 where these distinguished men assembled. His body lay in state in the Royal Academy and he was buried in St. Paul's Cathedral.

The mention of his portraits would include all the names famous in the upper world of society and the arts in his day, and there is no higher source for learning of the beauty of English women, the character of English men, and the fashions of taste of the later 18th century. He was graceful in arrangement of figures and accessories, was able in his portraits of men and women to differentiate a masculine vigor and a feminine charm, and in his mastery of color achieved a position, according to Ruskin, as "one of the seven great colorists" of the world. Posterity cannot fully appreciate his power in the latter direction, as he often used impermanent mediums and resorted to a thick impasto, which has cracked with time. His work is amply represented in the National Gallery and the National Portrait Gallery of London and the numerous great collections belonging to noble families. In America his pictures are to be found in fewer numbers in the larger museums and in the possession of private collectors. He published 'Discourses Before the Royal Academy' (1778), and 'Commentary on Du Fresnoy's Art of Painting.' His life was written by Malone (1798), Northcote (1813), Farrington (1819); but among recent biographies consult those by Claude Phillips (1894), Tom Taylor (1865), Sir Walter Armstrong (1900), Gower (1902).

Reynolds, William, American naval officer: b. Lancaster, Pa., 18 Dec. 1815; d. Washington, D. C., 5 Nov. 1879. He entered the

navy as midshipman in 1831, was commissioned lieutenant in 1841 and in 1851 was retired in consequence of failing health. He was subsequently assigned to duty in Hawaii where he negotiated a reciprocity treaty, and at the outbreak of the Civil War was again assigned to active duty. In 1862 he received command of the Asiatic Station, was promoted captain in 1866, commodore in 1870, and rear-admiral in 1873. He was chief of bureau and acting secretary of the navy in 1873 and again in 1874; and in 1877 was again retired on account of continued ill health.

Rezonville, rê-zôn-vêl, Battle of. See GRAVELLOTTE, and FRANCO-GERMAN WAR.

Rhabdocœlida, răb-dô-sê'li-dă, an order of *Turbellaria* which is characterized by the simple, unbranched, and rod-shaped alimentary canal. Some forms are very minute and often mistaken for *Infusoria*. Transverse fission is common in certain forms, and the power of regenerating lost parts is very great. A few genera have acquired a strictly parasitic habit, and a few also are marine and land forms, but most are inhabitants of fresh water. In many species two sorts of eggs are produced: summer eggs which are thin-shelled and are retained in the uterus until hatched, and winter eggs, which possess heavy brown shells, and, though produced in the fall, do not hatch out until spring. All *Rhabdocœlida* undergo a simple direct development.

Rhab'domancy. See DIVINATION; DIVINING ROD.

Rhadamanthus, răd-a-măn'thūs, according to Greek legend, a son of Zeus and Europa, and brother of Minos, king of Crete. According to another tradition Rhadamanthus laid the foundation of the Cretan code of laws, which his brother Minos completed. From fear of his brother he is said to have fled to Ocaleia in Bœotia, where he married Alcmena. In the belief of the Greeks a spirit in the lower world continued the business of life, hence Rhadamanthus, after his death, was made a judge in the kingdom of Pluto, or the Islands of Blessed, on account of the justice of his life, and had for his associates Æacus and Minos. The name suggests an Egyptian origin of the myth.

Rhadames, ră-dă'mēs. See GADAMES.

Rhætia, rê'shî-ă, a Roman province comprising the regions of Rhætia proper and Vindelicia and extending from the land of the Helvetii in Gaul to Noricum on the west, and from Gallia Cisalpina to the Danube. It included within its bounds what are now the Grisons and the Tyrol, the southern districts of Bavaria and Württemberg and the region of the Italian Alps, and contained the sources of the Rhine (Rhenus), the Inn (Ainus), and the Adige (Athesis), with many other rivers of northern Italy. The principal towns were Tridentum (Trent) in Rhætia proper and Augusta Vindelicorum (Augsburg) in Vindelicia. The original inhabitants of the country were considered by most ancient writers to be Etruscans who had been driven out of Italy by the invasion of the Gauls and who under their leader Rhætus took possession of the mountainous country. Modern research has tended to confirm the view of the ancients. The Rhætians were a brave and warlike people and their

frequent inroads into northern Italy led to retaliation on the part of the Romans. After a bitter struggle they were subdued in 15 B.C. by Drusus and Tiberius, stepsons of Augustus Cæsar. With Vindelicia, which was conquered at this time, the southern region was united to form the province of Rhætia. Diocletian divided the province into two, giving to the southern part the name of Rhætia Prima, while Vindelicia was known as Rhætia Secunda. After passing into the power of the Ostrogoths in the 5th century the region was overrun by the Boiarii who settled in the eastern part, the Alemanni who occupied the west, and the Longobards who established themselves in the south.

Rhamnaceæ, răm-nă'sê-ê, an order of trees and shrubs. The species, of which about 500 have been described and classified in about 40 genera, are mostly natives of temperate and tropical countries, in which they are widely distributed, especially in the northern hemisphere. They are frequently spiny, have usually simple leaves and inconspicuous, small, greenish blossoms which are followed either by dry fruits which break at maturity into three parts, or by fleshy ones which do not split open when ripe. In several species the fruit is edible as in the jujube (*Zizyphus jujuba*). The red fleshy pear-flavored peduncles of *Hovenia dulcis* are eaten in Japan and China, where the plant is native. Some are important ornamental plants; for instance buckthorn (*Rhamnus*), and New Jersey tea (*Ceanothus*). Various species of the former genus are valued for the yellow and green dyes they yield and *R. frangula* for its charcoal which is used in making gunpowder.

Rham'nocathar'tin, in chemistry, the uncrystallizable principle of buckthorn berries, distinct from rhamnin, the crystallizable glucoside in the berry. It is an amorphous, yellowish, brittle mass, soluble in all proportions in water and alcohol, but insoluble in ether. It has a bitter and very repulsive taste, and, when heated, melts to a yellowish-brown oil, gives off inflammable vapors, and leaves combustible charcoal. Ferric chloride colors it dark green, and, when heated with nitric acid, it yields a large quantity of picric acid.

Rhampsinitus, răm-pî-nî'tūs, a Græcised form of the Egyptian name Rameses, Rameses III., the first king of the 20th dynasty and the builder of the pavilion of Medinet Habu at Thebes. Brugsch makes Rhampsinitus a Greek form of *Ramessu pa nuter* ("Rameses the God"); Maspero, *Ramsis-sî-nit* ("Rameses, son of Neith"); by Diodorus he was called Remphis (Rempsis), from which comes the name Rameses by which Pliny called the monarch. Of him Herodotus (II., 121 *et seq.*) relates a story substantially the same as one of the most widespread folk-tales of the Aryan world. The king acquired an enormous treasure, and to secure it built a treasury of stone. The architect left one stone loose, so nicely adjusted as to be unnoticed, yet capable of being taken out and replaced without difficulty. Before death he entrusted the secret to his two sons, who from time to time plunder the king's treasure at their will, until at length the elder is caught in a snare set by the king. According to his desire, the younger brother cuts off and carries away his head, so that he may remain unknown. The king now orders the headless body to be ex-

posed unburied, protected by a guard of soldiers, but the younger brother lades an ass with skins of wine, allows some of it to run out, and is relieved in his distress by the soldiers, to whom in gratitude he gives his wine so freely that they all sink into a drunken sleep. Thereupon he shaves the right half of all their beards, and carries his brother's body to his mother. The king next sends his daughter to find out the clever thief. She promises her love to those who reveal to her the most extraordinary things that have ever happened to them, and when the young man in his turn relates the strange passages of his life she seizes him; but he cunningly slips his brother's dead hand into hers, and so escapes. The king is so much struck with wonder and admiration that he promises the clever thief his daughter in marriage, since he surpassed all mankind in knowledge: for, while the Egyptians surpassed all the world, he surpassed the Egyptians.

The wealth of Rameses III. is said to have been equal to 400,000 talents, or \$387,500,000, an incredible sum for those ages. It is represented on the walls of the palace treasury in the Medinet Habu as consisting of the precious metals and of wonderful jewels.

Herodotus gives the generally accepted story of the supposed thefts from the treasury, but his chronology and historical facts have been proven to be too inaccurate to be relied upon.

Rhap'sodists, a name given the wandering minstrels among the ancient Greeks, who sang the poems of Homer and those of other poets. They were for a long time held in high esteem, until the poems were committed to writing, and through the medium of manuscript copies became pretty generally known, when the rhapsodists soon lost their importance. Each ballad or recitation was termed a rhapsody, and thence it was applied to the separate books of the 'Iliad' and 'Odyssey.'

Rhat'any, or **Rattany**, shrub-like plants (*Krameria ixina* and *K. triandra*) of the order *Polygalaceæ*. They are natives of the Peruvian and Bolivian Andes, and are confined mainly to the table-lands of high altitudes. The roots are used extensively for coloring Portuguese wines and for mixing with charcoal or orris-root to be used as a dentifrice; and are an important article of export from Peruvian ports.

Rhazes, *rā'zēs* (ABU BEKR MAHAMMED IBN ZAKHARIYA AR-RAZI), Arabic physician: b. Rai or Raz (ancient Rhagæ), near Teheran, probably 923 A.D. He acquired great philological and philosophical knowledge, but studied chiefly music. Eventually he became expert in the medical science of his day, and was made director of the Bagdad hospital. There is a story that, when aged, he became blind, and refused to have an operation performed upon his eyes, because the surgeon about to undertake it could not tell how many membranes the eye contained. When it was urged that the operation might nevertheless succeed, he still refused, saying that he had seen so much of the world he was weary of it. The best known of the books that pass under his name is 'Al-Havi,' but its authenticity is questioned. His treatise on the smallpox and measles is the oldest account in existence of those two diseases. It has been translated several times into Greek and Latin, and into English from the Arabic

text by Greenhill (1847). His 'Ketab Al-Mansuri' is a complete system of medicine drawn from Arabic and Greek sources.

Rhé, Île de, *êl dè rà*. See **RÉ, ÎLE DE**.

Rhea, *rê'a*, an ancient Cretan earth-goddess, daughter of Uranus and Gæa, wife of her brother the Titan Cronus, and by him mother of the Olympian deities Zeus, Hades, Poseidon, Hera, Hestia, Demeter. She was early identified with the Asiatic nature-goddess Cybele, the Great Mother, who was worshipped on mountains in Mysia, Lydia, and Phrygia. Her Cretan *Curetes* corresponded to the Phrygian *Corybantes*, many of whom mutilated themselves like Attis in the frenzy of their orgies. Rhea was supposed at first to make her home in the towering hills of Asia Minor. It was her delight to tame the ferocious beasts found in these wildernesses, as well as to protect the fair towns lying in their valleys. Thus she became known as Mater Turrita, and was represented as wearing a crown, turreted like a wall. Rhea's supposed love for the Phrygian shepherd, Attis, gave much color to her worship. In Pessinus, in Phrygia, there was a cave under Mount Dindymon, where was a large stone supposed to be the heaven-sent image of the goddess, as well as the tomb of Attis. This was the centre of her worship, and here the first temple to Rhea is said to have been erected by King Midas. From this centre the worship spread to the neighboring towns and provinces, finally reaching Athens. The worship of Rhea continued long after the decadence of Phrygian civilization. Its introduction into Rome, during the second Punic war, was the result of a prophecy of the Sibylline Fates which told that her image brought to Rome would expel a common foe. The stone in the cave at Pessinus was therefore placed in the Temple of Victory in the capital city, a holiday being proclaimed to celebrate the event.

Rhea, the generic and usual book-name of the South American ostriches or nandus, which, although true ratite birds and occupying the place of ostriches in the American avifauna, yet differ so greatly from the African species that ornithologists universally rank them as a distinct family (*Rheideæ*) or even order (*Rheæ*). Conforming to the general type of the ostriches, the rheas differ in having three toes with large claws, the head and neck fully feathered, the flowing plumes absent from the wings, and especially the tail, the ischiatic instead of the pubic bones forming the pelvic symphysis and the palatal structure peculiar in several respects. Three species of *Rhea* have been described; *R. americana*, found throughout the greater part of South America; *R. macrorhyncha*, which is confined to northeast Brazil and is distinguished by its darker color and longer bill; and *R. darwini*, of southern Argentina, which is smaller and has tarsi covered with small scales instead of scutes as have the others. The newly hatched young of the latter are said to have the legs feathered to the toes. Rheas are known to the natives as nandus or emas (the latter a corruption of emu introduced by the Portuguese), and live in small parties on the pampas and dry plains, where they associate with wild horses, deer, and guanacos. In general habits they closely resemble the ostriches (q.v.), but usually run with the wings lowered instead of

CATHEDRAL OF REIMS.

elevated. They are said to be able to swim across wide rivers. Because of the well-developed syrinx, which is absent in the ostriches, the male rheas have a loud, resonant call, especially heard during the mating season, when they also fight viciously. They are polygamous and the male incubates the score or more of eggs deposited by several females in one nest. They are omnivorous. Although lacking the precious plumes of the ostrich the feathers of the rhea have a commercial value in the manufacture of feather dusters. Many thousands are killed by shooting or with the bolos, or are run down with hounds or horses and clubbed to death. In many places they are threatened with extinction; but, although they breed readily in confinement, no efforts to raise rheas on a commercial scale appear to have been made. Consult: Darwin, 'Voyage of the Beagle' (New York, 1889); Mosenthal and Harting, 'Ostriches and Ostrich Farming' (London, 1877).

Rhea, or China Grass. See RAMIE.

Rhea Letter, The, in American history, a famous political episode of the time of the Monroe administration. On 6 Jan. 1818, Andrew Jackson, then army department commander in the Southwest, wrote to President Monroe regarding the Seminole troubles in Florida and advising the prompt seizure of East Florida, which he declared could be done "without implicating the government." He offered to accomplish the seizure himself within 60 days, if it should be indicated to him that it were desirable. John Rhea, a congressman from Tennessee, was the secret channel through which he hoped Monroe's assent might be signified. It was not. In 1831, during Jackson's administration, in the height of his quarrel with Calhoun, which turned in part upon the Seminole affair, Rhea wrote to Monroe, hoping to elicit from him something that would implicate him as approving Jackson's plan. Monroe, on his death-bed in New York, denounced Rhea's insinuations as utterly false.

Rhead, Louis John, American artist: b. Etruria, Staffordshire, England, 1860. He was educated at the Art Training School, London, and in 1883 came to the United States to act as art manager for D. Appleton & Company. He has exhibited work in both oil and water colors in various American and European galleries and won a medal in Boston in 1895 for his artistic posters. He has illustrated many books, among them being: 'Pilgrim's Progress'; 'Idylls of the King'; 'Robinson Crusoe' (1900); Dr. Hillis' 'Psalms of David' (1900); etc.

Rheam, Henry Meynell, English artist: b. Birkenhead 13 Jan. 1859. He was educated in Germany and took up the study of painting at Heatherleys in 1884 and continued it in Paris under Bongerueau and Tony Robert Fleury. In 1890 he became allied with the Newlyn group of painters. His 'Spells' was purchased in 1893 for the Walker Art Gallery by the Liverpool Corporation.

Rhees, rēs, Rush, American Baptist clergyman and educator: b. Chicago, Ill., 8 Feb. 1860. He was graduated from Amherst College in 1883, and from the Hartford Theological Seminary in 1889. He was pastor of the Middle Street Baptist Church, Portsmouth, N. H., 1889-92, and professor of biblical New Testa-

ment interpretation (1892-1900) in the Newton Theological Institution, Newton Centre, Mass. He was elected president of the University of Rochester, Rochester, in July 1900. He has published 'The Life of Jesus of Nazareth: a Study' (1900).

Rhees, William Jones, American bibliographer: b. Philadelphia 13 March 1830; d. Washington, D. C., 13 March 1907. He was graduated from the Central High School of that city in 1847 and was in charge of the social statistics of the 7th census (1850-2). In 1852 he became chief clerk of the Smithsonian Institution of whose publications he had general charge. He wrote 'Manual of Public Libraries, etc., in the United States and British Provinces in North America'; 'The Smithsonian Institution'; 'James Smithson and his Bequest.'

Rheims, rēmz, Fr. rāns (Reims), France, in the department of Maine, 100 miles northeast of Paris. Strong forts crown the adjacent vine-clad hills. Its industries are considerable, embracing, besides champagne, the manufacture of textiles, dyeworks, breweries, distilleries, etc. It is also an important market for raw wool. The town was early imbued with a religious character owing to many solemn and historical rites celebrated in its great cathedral. Here the kings of France were successively crowned for many generations, and Clovis (438-533) was baptized within its walls. The façade of the cathedral is a mediæval masterpiece. A wealth of tapestry, sculpture, and paintings (Titian, Tintoretto, and Poussin) beautify the interior, and innumerable statues of artistic grace adorn the exterior. The rose-window and portal are of rare magnificence. The archiepiscopal palace, town-house and museum are notable buildings. Pop. (1901) 107,773.

Rheingold, rin'gōlt, Das ('The Rhine-Gold'), a music drama by Richard Wagner, prelude to 'Der Ring des Nibelungen.' It consists of four scenes, the first disclosing the depths of the Rhine, where on a high cliff rests the Rheingold guarded by the three Rhine-daughters. The possession of a ring wrought from this gold would give supreme power over the world; but in order to work the charm whereby the ring must be made, the one essaying it must have forsworn love. Alberich, the Nibelung, comes to the depths of the Rhine, and gains possession of the gold through the carelessness of its guardians. Scene II. reveals Wotan and Fricka before the castle of Valhalla, built for Wotan by the two giants Fasolt and Fafner. Straightway the two appear and claim as the promised reward of their labors Wotan's daughter Freia, the goddess of youth. Loge, the demigod of fire, who had persuaded Wotan into the contract with the giants with the assurance that he would provide some way of evading the payment, now appears, and reports that in his search over the world he had found that nothing in water, on earth, or in air would ever give up the love of woman; but that the Rhine-daughters had told him of Alberich, the present ruler of Nibelheim, who had forsworn the love of women and made himself a ring by power of which he had amassed great treasure. The giants, to whom Alberich of old was an enemy, offer to give up Freia in exchange for the Nibelung's treasure. Thereupon (Scene III.) Wotan and Loge, together

with the two giants and Freia, descend to Nibelheim, make Alberich a prisoner, rob him of his treasure, his Tarnhelm, or cap of darkness, which Mime, his brother, has made for him, and also the ring, which Wotan places upon his own finger. The helpless Alberich curses the ring and prays that it may bring death and destruction upon every one into whose hands it comes. Freia is finally ransomed by the gold, the Tarnhelm, and also the ring, which Erda advises Wotan to add on account of the curse placed upon it. No sooner do the giants possess their treasure than they quarrel over its division, and Fafner strikes Fasolt dead, thus realizing the first curse of the ring. After a mighty storm summoned up by Donner (Scene IV.), the gods cross a rainbow bridge leading up to Valhalla, Wotan, plunged in thought, leading the way, while the voices of the Rhine-maidens are heard lamenting the loss of their gold.

This work was performed first (without authorization) at Munich in 1869; then at Baireuth in 1876; for the first time in America, at New York, in 1889. It contains remarkable passages of instrumentation, especially in the introduction, which consists of 136 measures running throughout in the chord of E-flat major.

Rhenish Prussia. See RHINE, PROVINCE OF THE.

Rheostat, in electricity, an instrument invented by Wheatstone for measuring electrical resistances. Two rollers, one non-conducting, and the other of brass, are geared together, so that when either is turned by means of a handle a fine copper wire will be uncoiled from one roller as it is wound upon the other. Two binding-screws, one of them in contact with the brass cylinder and the other with the end of the wire on the non-conducting cylinder, connect the apparatus with the wires of the battery. To use the rheostat, the resistance to be measured is put in circuit with a constant battery and a galvanometer, and the indication of the galvanometer is noted; the resistance is then removed from the circuit, and the rheostat is put in its place, and the handle turned till the galvanometer gives the same reading as before; the resistance of the rheostat is now the same as the resistance which was to be measured, and it is measured by the number of coils of copper wire on the insulating roller.

Rheotropism, that tendency in plants which leads their roots, when immersed in running water, to curve in accordance with the current. Positive rheotropism causes the roots to curve up stream; and negative rheotropism produces the opposite curvature.

Rhesus or **Bengal Monkey**, a common Indian macaque (*Macacus rhesus*). It is a strong species with powerful limbs, but without the ruff or beard found in some allied species. The body attains a length of about two feet, and the tail is of medium length. Brown is the prevailing color, but the bare face and the callosities are flesh-colored or red. The rhesus monkey is very intelligent and mischievous, and the young ones can be easily tamed. In several

parts of India the Hindus protect this species, for which they have a great veneration.

Rhetoric, the art of correct speaking and writing, of using language not only correct as to grammar, but best adapted to convey the effect desired by the speaker or writer. The term "rhetoric" is, however, usually applied to spoken discourse, which may either be a simple statement of fact or theory to one or more persons, or an oration intended to make a profound impression on a vast multitude of hearers and readers. An oration may be powerful and at the same time ungrammatical; in such case it is outside the bounds of rhetoric, in the strict meaning of the word. He who cultivates rhetoric must keep within the recognized rules of language. He must be grammatical as well as logical. Rhetoric includes, along with correct expression, the acquirement of a clear and pleasing style, and attractiveness in presenting a subject. It is, in brief, the art which aims to bring to highest perfection the attribute of speech, which distinguishes man from all other animals, and which is the chief instrument of human progress and achievement. In ancient and modern times, rhetoric has therefore been regarded as one of the noblest studies. Among the Greeks Aristotle and Longinus were the great masters of rhetoric, and Aristotle's 'Art of Rhetoric' still remains the ablest analysis ever written of the mental and ethical characteristics of oratory. Among the Romans Cicero held the palm as an authority on this subject. It was not emphasized in the Middle Ages, but in modern times it has again arisen to importance, and every leading institution of learning has its chair of rhetoric. In no country in the world is the art of rhetoric more generally cultivated than in the United States, owing to the freedom of speech and of the press, and to the fact that effective oratory is almost certain to command public preferment. The student of rhetoric should consult Blair's 'Lectures on Rhetoric,' Campbell's 'Philosophy of Rhetoric,' and other standard works on the art, and he may study also with the best results the orations of Webster, Clay, and other great speakers, the messages and addresses of Lincoln, Washington's 'Farewell Address,' and other well known examples of pure and vigorous English.

Rhett, rĕt, **Robert Barnwell**, American politician: b. Beaufort, S. C., 24 Dec. 1800; d. Saint James' Parish, La., 14 Sept. 1876. He was the son of James Smith, but in 1837 adopted the name of Rhett, a prominent colonial ancestor. He studied law, was elected to the legislature in 1826, and in 1832 was elected attorney-general of the State. He was one of the leaders of the Nullification movement and a more strenuous advocate of States' right than even Calhoun. In 1837-49 he sat in Congress and in 1850 was elected to succeed Calhoun in the Senate. He stoutly upheld slavery, opposed all compromises, and in 1851-2 he urged the secession of South Carolina, whether accompanied by other States or not. After the elections of 1852 Rhett resigned from the Senate and retired to his plantation. He later edited the Charleston 'Mercury' in which he advocated his extreme views, and in 1860 he again came into prominence as a member of the South Carolina Convention and was one of the committee which

wrote the address giving reasons for secession. He was a delegate to the provisional congress at Montgomery, Ala., in 1861, and later an active member of the Confederate Congress. He removed to Louisiana after the war.

Rhett, Thomas Grimke, American military officer: b. South Carolina about 1825; d. Baltimore, Md., 28 July 1878. He was graduated from West Point in 1845, served in the Mexican War, was brevetted captain for conduct at Puebla in 1847 and in 1858 received rank as major. In 1861 he resigned his commission in the United States army and was commissioned major-general by the governor of South Carolina. He was chief of staff to Gen. Johnston until 1862 and was then assigned to the trans-Mississippi department. He served as colonel of ordnance in the Egyptian army in 1870-3 and then resigned.

Rheumatism, a constitutional disease characterized by inflammation of the connective-tissue structures of the body, especially of the joints and muscles, and attended by localized pain. It is usually recurrent. Three forms are recognized: (1) acute rheumatism (acute articular rheumatism, acute inflammatory rheumatism, rheumatic fever); (2) chronic rheumatism; (3) muscular rheumatism or myalgia.

Acute rheumatism is marked by high fever, inflammation and swelling of one or more of the larger joints, intense pain, increased by movement, profuse sweating, scanty high-colored urine, and a tendency to inflammation of the endocardium (endocarditis) and of the pericardium (pericarditis). In many cases there is apparently a hereditary tendency; in others, sudden checking of perspiration in a cold and damp atmosphere may cause the disease. Conditions which lower vitality, such as chronic alcoholism, nervous debility, or poverty associated with exposure and insufficient food, are predisposing causes. More males than females have acute rheumatism, probably because of more hardship and exposure. It is quite common among farmers, longshoremen, coachmen, stokers, motormen, sailors, scrub-women, etc. It most frequently occurs between the ages of 15 and 30, is rare before the 10th year and after the 50th. An injury to a joint, or excessive muscular work, may be the initial cause. The disease is rare in the tropics, common in the temperate zones; in the United States it is most frequent in the early spring and late fall; and it is often endemic and sometimes epidemic.

The specific cause or origin of rheumatism is not known. That it is always due to an arthritic diathesis, inherited or acquired, is a theory not generally accepted in this country. The infection theory of Hueter, though accepted by many, is not generally adopted. As to the chemical theory, that the disease is due to an excess of lactic or uric acid in the blood, some believe that the acids are due to bacterial activity; others, that all the phenomena of rheumatism cannot be produced by one chemical substance. The nervous theory, not fully recognized, assumes that the joint-lesions are trophic, owing to disturbances of the nervous system, from the action of cold on nerve-centres, etc. The morbid anatomy shows characteristic disorders of the joints — synovial membrane swollen and hyperæmic; serous infiltration of liga-

mentous and other tissues; joint-fluid turbid with albumen, fibrin and leucocytes (pus and blood rarely present); sometimes ecchymoses on cutaneous and serous surfaces. In the blood the red corpuscles are reduced more than one half; the hæmoglobin is much less than normal; but fibrin and leucocytes are largely increased. The heart is affected in very many cases, most frequently the left side (rheumatism of the heart), the edges of contact of the mitral valves being swollen and covered with fibrinous masses; less frequently, the aortic valve; rarely, the pulmonary or tricuspid. Contraction and distortion of the affected valves may result. Ulceration is rare. Simple fibrinous or sero-fibrinous pericarditis is common; myocarditis seldom occurs. The attack may begin with headache, indigestion, aching, chilliness, slight tonsillitis or pharyngitis, but usually comes with a chill, followed soon by high fever (may be 103° or 104° F.), swelling, tenderness, heat, and shiny appearance of one or more joints (knees most often, then wrists and fingers, ankles, etc.), a coated tongue, foul breath, a soft pulse of 100 to 110, thirst, constipation, and by profuse sour sweat. If not treated, the disease lasts from two to three weeks. There is always a tendency to recurrence, complications, and migration from one joint to another. The mind is clear, except when the fever is very high. Coma, which is rare, is due either to high fever or nephritis.

So-called cerebral rheumatism is due to a toxic congestion. Sometimes urticaria and spots of ecchymosis appear upon the skin, and in children small nodules, firm but movable, are attached to tendons and fasciæ, and are found over the spine, scapula, and inflamed joints.

Follicular tonsillitis is considered by some to be due to rheumatism. But the most serious complications of acute rheumatism are endocarditis and pericarditis. Other complications are chorea, conjunctivitis, pleurisy, bronchitis, peritonitis, orchitis, etc.

There is a sub-acute rheumatism, very common, with mild symptoms and slow recovery. It may follow an acute attack or be sub-acute from the outset, and may pass into the chronic form. Temperature is seldom above 102° F. The so-called acute rheumatism of children is usually sub-acute; the joint-symptoms may be so slight as to be readily overlooked, but there is more liability to cardiac inflammation than in adults. Children perspire less, but are liable to have chorea, tonsillitis, and cutaneous manifestations.

Acute rheumatism is to be distinguished from arthritis following scarlet fever and other acute diseases; from acute osteomyelitis, scurvy (in children), gout, arthritis deformans, and gonorrhœal rheumatism.

Severe cases may recover within a week; and mild cases last several weeks. The joints are not left with fibrinous adhesions unless chronic rheumatism supervenes. Death is rare, and when it occurs it results from high fever, pneumonia, pleurisy, or myocarditis. Relapses are quite common. Treatment requires many details. Among preventive measures are care against exposure to cold and damp, especially when overheated; freedom from muscular strain; the wearing of woolen underclothing in winter, and of linen-mesh in summer; abstinence from

sweets and malt liquors; very moderate eating of animal food; sponging with cool water, followed by friction; outdoor exercise; and the keeping of the bowels open with Carlsbad water or Rochelle salt. During the attack place the patient between blankets on a comfortable mattress; have him use a bed-pan; carefully dispose the inflamed part in a comfortable position. While the disease is severe give light food, no meat, sweets, or malt liquors; allay fever with cool spongings, and tincture of aconite; quiet the patient with Dover's powder or codeine; locally apply methyl salicylate, oil of wintergreen, or equal parts of guaiacol and glycerin; and keep the part warm with cotton batting, oil-silk, etc. Medicinally, salicin, salol, or salicylate of soda and bicarbonate of potassa or soda, or the citrate of potassa seem to be of most avail.

Chronic rheumatism is a form of chronic joint-inflammation, attended by moderate pain, and by changes in the joints resulting in their deformity. It begins insidiously, or follows attacks of acute or sub-acute rheumatism, and is rare before the 40th year. The predisposing causes are poor hygienic conditions, debility, malnutrition, cold and damp, and occupations which involve the repeated and long-continued use of certain joints, as in the cases of seamstresses and tailors. A moderate thickening and some distortion appear in affected joints (fingers and knees especially) which may be bilateral. The changes are mainly in the fibrous tissues, though sometimes there is synovial injection and effusion. Erosion of cartilages is seen only in prolonged cases. Endocarditis, pericarditis, and pleurisy are rare.

The symptoms slowly develop; general health may be good; pain occurs when joints are red and swollen, and may be severe at night. Joints swell from time to time, and some persons readily predict an attack. The muscles about the joints after a time atrophy and the affected joints are deformed by deflection due to adhesions. Slight fever may accompany attacks. The diagnosis excludes gout and arthritis deformans (qq.v.).

In treatment medicine is of uncertain value. Iron, Vichy water, iodide of potassium, and Carlsbad salts or phosphate of soda may be used. More relief is to be obtained from douching and sweating of the joints, massage, protection against cold and damp and injuries to the joints, an ample diet (no sweets, and no alcoholic stimulant except whiskey), a dry equable climate, and residence at one of the spas.

Muscular rheumatism, or myalgia is a painful affection of various voluntary muscles and of the fasciæ and periosteum to which they are attached. It is most common in youth and young adults and among those exposed to cold and damp when overheated, and those who overuse certain muscles. Heredity, goutiness, and lithæmia are predisposing causes. The disease is never fatal, whether it is neuralgic in character or is an inflammation of muscular tissue (myositis) is not determined. The symptoms include local pain and tenderness, increased by contraction or movement of the affected muscle; usually the pain is an intense dull ache. There is seldom any heat, swelling, or redness. Occasionally the muscle cramps and is most comfortable if semi-flexed. Sometimes there is fever. In torticollis or stiff-neck (unilateral) some of the muscles

of the neck are involved. The patient dreads to move the head, and moves the body instead. In pleurodynia one side is affected (generally the intercostal muscles, but sometimes in the serratus and pectoralis), usually the left. Pain is increased by movements, coughing, or sneezing.

Lumbago, a muscular rheumatism affecting the muscles of the lumbar region and their tendinous attachments, is bilateral, quite frequent, and is often caused by strain of the muscles of the loins. An attack often begins suddenly with an excruciating pain when the sufferer is attempting to rise from a sitting posture, or to change his position in bed. If the loin-muscles are kept rigid the patient may be able to move about. Treatment calls for rest of affected muscles (best in bed), the application of heat and anodyne liniments, ironing the loins with a hot flatiron over a few thicknesses of flannel or thick wrapping paper, or galvanism.

Muscular rheumatism is distinguished from neuralgia by localized pain, increased by voluntary movements, and by the absence of tender spots. Recovery usually occurs in a few days, except in debilitated persons, those with rheumatic tendencies, or subjects of chronic alcoholism.

Preventive treatment requires freedom from damp and cold, and from muscular strain, sponging and friction, vegetable diet, and warm underclothes. Massage and a Turkish bath may prevent an attack. For local treatment rest, heat, turpentine stupes and anodyne liniment are of use. Medicine is of little value. In pleurodynia, strapping the chest, or the use of a wide flannel binder, is often of much service.

Rheumatism-root. See TWIN-LEAF.

Rheydt, rî, Germany, a town of Prussia, in the government of Düsseldorf, 16 miles west of Düsseldorf, important on account of its industries, which embrace silk and satin goods, cottons, and mixed fabrics, foundries and machine-shops, printing and dyeing works, breweries, distilleries, etc. Pop. (1900) 34,034.

Rhigas, rî'gas, **Constantine**, Greek patriot: b. Velestino (the ancient Phæra) about 1753; d. Belgrade, Serbia, 1798. He wrote not only in Greek but also in French, and was a poet and a proficient in music. He formed the bold plan of freeing Greece from the Ottoman Porte by means of the secret association of the Heteræa, and succeeded even in bringing powerful Turks into his conspiracy. From Vienna he kept up a secret correspondence with the most important confederates in Greece and in other parts of Europe. At the same time he composed in his native language a number of patriotic songs, calculated to inflame the imagination of the Greek youth and embitter them against the Mussulmans. Having been arrested in Trieste he was with several other prisoners conducted to Vienna. Rhigas and three others of those arrested were sent back in chains to Belgrade in May 1798, and put to death by the Turkish authorities. During the Greek war of independence, which ultimately led to the emancipation of their country from the Turkish yoke, his songs were in the mouth of everyone. The most celebrated of them are his translation and adaptation of the 'Marseillaise.' Consult: Edmonds, 'Rhigas Phæraios, the Protomartyr of Greek Independence' (1890).

RHINE

Rhine, *rin*, a river of Germany, and until the Franco-German war of 1870-1, the boundary for a part of its length between France and Germany. It is one of the most picturesque rivers in the world, and its natural beauty is heightened by the historic and legendary traditions with which its name is associated. Its direct course is 460 miles long and its indirect course about 800 miles; the area of its basin is about 86,600 square miles. It is formed in the Swiss canton Grisons by three main streams called the Vorder, Mittel, and Hinter Rhein, or the Upper, Middle, and Lower Rhine. The Vorder Rhein rises in the small Toma Lake (7,690 feet high), lying to the northeast of the St. Gothard, and is augmented by two streams which unite with it near Chiamut (5,380 feet). The Mittel Rhein issues from a small lake west of the Lukmanierberg, traverses the Medelserthal, and joins the Vorder Rhein at Disentis, from which point the united stream is called Vorder Rhein. It takes an easterly direction, and at Reichenau unites with the Hinter Rhein, which issues from the Rheinwald Glacier, in the Adula group, and has a course of about 70 miles through the Rheinwaldthal before reaching Reichenau. Here the stream takes the name of Rhine, has a width of 130 to 140 feet, and admits of floating. The Rhine first becomes properly navigable at Coire after receiving the Plessur. It now turns north, and shortly after being augmented by the Landquart quits the Grisons, forms the boundary between the canton of St. Gall on the left and Liechtenstein and Vorarlberg on the right, receiving the Ill from the latter, and enters the Bodensee or Lake of Constance, continued by the Untersee. On issuing from the Untersee it flows west, separating Switzerland from the grand-duchy of Baden, and continues its course to Schaffhausen and Basel, receiving, as it proceeds, on the left the Goldach, Thur, Thöss, Glatt, and Aar, and on the right the Wutach and Alb, mountain streams of the Black Forest. At Schaffhausen the river forms perhaps the grandest waterfalls in Europe. At Basel it again begins to flow north, when it separates the German territory of Alsace from Baden, forms the boundary between the latter and the Bavarian palatinate, flows thereafter through the grand-duchy of Hesse, forms the boundary first between it and Nassau, and then between Nassau and the Prussian Rhenish province, till it wholly enters the latter at Coblenz. Below Emmerich it enters the Dutch province of Gelderland, and shortly after divides into two branches, a south and a north. The south, called the Waal (anciently Vahalís), carries off two thirds of its water, and joins the Maas or Meuse at Woudrichem. The north branch, after making several windings in its course to Arnhem, but still retaining the name of Rhine (Rijn), divides at Westervoort, before reaching Arnhem, into two branches. Of these the right proceeds as the New Yssel, in the bed of the canal which Drusus dug to connect the Rhine with the Old Yssel, till it reaches Doesburg, where the New and Old Yssel unite to pour their accumulated waters into the Zuyder Zee. The left arm proceeds, under the name of Rhine, in a course nearly parallel to the Waal, passing Wageningen and Rhenen to Wiikby-Durstede, where it again bifurcates, sending a very feeble branch, under the name of the

Crooked Rhine, to Utrecht, where, by the canal of Vaart, it communicates with the much larger branch, called the Leek, and flowing past Vianen and Schoonhoven unites with the Maas above Grimpen-op-de-Lek. The Crooked Rhine becomes little better than a ditch; on leaving Utrecht it proceeds toward Leyden, and at the beginning of the 19th century was lost in the sand beyond Katwijk-aan-den-Rijn. At an earlier period it had here found an outlet into the ocean; and in more recent times, after surmounting many difficulties, the lost water of the Rhine has been collected in a canal, and by the aid of three sluices the outlet has again been established. The breadth of the Rhine and the character of its channel differ much at different parts of its long course. Its breadth at Basel is 750 feet; between Strasburg and Spire from 1,000 to 1,200 feet; at Mainz 1,500 to 1,700 feet; and at Schenkenschanz, where it enters the Netherlands, 2,150 feet. Its depth varies from 5 to 28 feet, and at Düsseldorf amounts even to 50 feet. The Rhine abounds with fish, including salmon and salmon-trout, but more especially sturgeon, lampreys, pike, and carp. Wild fowl also abound on its banks and countless islands. Some gold is contained among the sands brought down into it from the mountains of Switzerland and of the Black Forest.

The navigation of the Rhine is very important, particularly for west Germany. The navigation is rendered dangerous by waterfalls, more especially those of Schaffhausen, of Zurzach (near the mouth of the Wutach), of Laufenburg, and of Rheinfelden; it is also rendered dangerous by the Bingerloch, near Bingen, where the stream becomes suddenly narrowed and confined between lofty precipices, and by similar causes, though in a less degree, at Bacharach, St. Goar, and at Unkel.

The Rhine is distinguished alike by the beauty of its scenery and the rich fields and vineyards which clothe its banks. Hence no river in Germany, more especially since the introduction of steam-vessels, attracts so many tourists. From Basel to Mainz it flows through a wide valley, bounded on the left by the Vosges, and on the right by the Black Forest and the mountains along the Bergstrasse. From Mainz the mountain ridges approach the stream at first only on the right bank, where they form the Rheingau; but at Bingen they begin to hem in the left bank also, and continue from thence to Königswinter to present a succession of lofty mountain summits, bold precipices, and wild romantic views. Pleasant towns and villages lie nestled at the foot of lofty hills; above them on all sides rise rocky steep slopes clothed with vines, and every now and then the castles and fastnesses of feudal times are seen frowning from precipices apparently inaccessible. At times the chain of ridges on either side opens out, and allows the eye to wander into romantic valleys, along which tributaries of less or greater magnitude keep dashing down or gradually winding to the parent stream. On the river itself much additional variety and beauty are given to the scenery by the constant recurrence of picturesque and verdant islands.

Scarcely a river in the world is of importance to more people than the Rhine. Since long before Cæsar's day this great stream has been the scene of stirring events in the world's drama.

Vercingetorix, Charlemagne, Tilly, Wallenstein, Frederick the Great, Napoleon Bonaparte, Bismarck, and Moltke, these are some of the illustrious names in the long roll of warriors who strove along its banks for command of this great highway. Famous in song and story, lined with great cities and ruined castles of robber barons, it is the Mecca of tourists at all seasons of the year. Up one side and down the other, or by river from Cologne to Mainz, every mile has its beauties and its legends. Between Darmstadt and Heidelberg the Taunus Mountains shut in its basin on one side, the Odenwald, scene of the Siegfried saga of Wagner's Nibelungen operas, on the other. An ideal region for the man fond of walking tours, for the villages are so close together that no spot along its banks is more than an hour's walk from a village. Cyclists and automobilists find good roads, generally military highways, all the way from Holland to Basel and the Lake of Constance.

Rhine, Confederation of. See CONFEDERATION OF THE RHINE.

Rhine, Province of the, or Rhenish Prussia (Ger. *Rheinland*), the westernmost province of Prussia, touching west and north, Luxemburg, Belgium, and Holland; greatest length from north to south about 200 miles, greatest breadth about 90; area, 10,423 square miles. It is divided into five governments or districts, Coblenz, Treves, Cologne, Aachen (Aix-la-Chapelle), and Düsseldorf. The city of Coblenz is the official capital of the province, but Cologne is the town of most importance. The southern portion of the province is hilly, being traversed by the ranges of the Eifel, Hochwald, etc. It is watered by the Rhine, the Moselle, and some affluents of the Meuse. A large proportion of the surface is in forest. Besides the usual cereal crops, tobacco, hops, flax, rape, hemp, and beet-root are raised; fruit culture and the vine culture are also carefully attended to. Cattle are extensively reared. It is the most important mineral district in Germany, abounding in coal, iron, lead, zinc, etc. It is likewise an active manufacturing district, there being numerous iron works and machine shops, textile factories, breweries, distilleries, etc. Pop. (1900) 5,759,000, the majority Catholics.

Rhine Wines. See WINES.

Rhineland, rin'lán'dér, Wis., city, county-seat of Oneida County; on the Wisconsin River, and on the Saint Paul & S. S. M., and the Chicago & N. R.R.'s; about 100 miles northwest of Green Bay. The Pelican Rapids in the Wisconsin at this place furnish extensive water-power. It is in a lumbering region, and its chief manufacturing establishments are lumber mills, which have about 500 employees; paper mills, 175 employees; refrigerator works, 75; boat building works, 30; iron works, 20; and minor industries, 250 employees. There are seven churches, Saint Mary's Hospital, seven public schools, one parish school, and a Carnegie Public Library. The two banks have a combined capital of \$100,000. The government is vested in a mayor and 12 aldermen. Pop. (1890) 2,658; (1900) 4,998. It is estimated that the population now (1903) is 6,000.

Rhini'tis. See NOSE AND THROAT.

Rhinoceros, a massive hoofed mammal of the family *Rhinocerotidae*, characterized prominently by its nasal horns, the species of which are now confined to South Africa and southeastern Asia, although in past ages of world-wide distribution. These animals are all of large size and ungainly form, and the very thick skin is usually thrown into folds of more or less definite kind, and as a rule is very sparsely haired. The limbs are stout and comparatively short, and terminate in round feet with three toes on each foot, each toe encased in a hoof. The skull is of pyramidal form, with a confluent orbit and temporal fossa, and the nasal bones are very prominently developed, and support one or more "horns," which grow one behind the other. The muzzle is extended by a more or less elongated pointed and prehensile upper lip; the incisors and canines are diminished but functional in the African species, and entirely wanting in adults of the Asiatic species. The cheek-teeth are massive and their crowns exhibit complexly folded ridges, varying much with the species. The horn of the rhinoceros is of epidermic origin, based upon thickened "bosses" of the underlying bone, but really formed of fibres of horn practically bristles, agglutinated as they grow. When two horns are developed, the hinder one is borne by the

Indian Rhinoceros (*Rh. indicus*).

frontal bones, and is situated in the middle line behind the front horn. The front horn is generally much larger than the hinder one, the latter, when larger, possessing a different shape from the front structure. They serve many useful purposes in savage economy, but are of little service in civilized arts, although formerly the horn was considered to have medicinal and even magical virtues, especially in the detection of poisoned wine.

Although subdivided by some zoologists, the rhinoceroses may properly be regarded as forming only a single genus, *Rhinoceros*, with five existing species, and some extinct species, to which must be added several genera known only by fossil remains.

The most familiar species is the typical one-horned or Indian rhinoceros (*Rh. indicus*), which, like all the Asiatic species, has the skin thrown into very definite folds, corresponding to the regions of the body. The horn of this species is black, very thick, from one to (rarely) two feet long, and rises from the tip of the nose. The upper lip is very large, and overhangs the lower; it is furnished with strong muscles, and is employed by the animal somewhat as the elephant uses his trunk. The skin is naked, rough, extremely thick, and of a purplish brown hue. About the neck it is gathered into large folds; a fold also extends between

RHINOCEROS

the shoulders and fore-legs, and another from the hinder part of the back to the thighs. It is naturally soft and easily penetrated by a rifle-ball or hunting knife, but when suitably dried is exceedingly hard and polishable. The tail is slender, flat at the end, and furnished at the sides with very stiff black hairs. This animal was well known to the ancients when it ranged over most of the peninsula of India, and was introduced into the games of the circus by Pompey. From the time of the fall of the Roman Empire, however, it was lost sight of so completely, that, prior to the 16th century, naturalists were of opinion that it had never existed, or, if so, that it was extinct. When the Portuguese, however, opened the way to India, these animals again became known, and many were introduced into Europe, a historic one, sent by an Indian potentate to the king of Portugal in 1513, stood as model for a well-known drawing by A. Dürer. This species is now much restricted in range, and not to be found outside of the plain of Assam, where it confines itself to the marshy grass-jungles, where, like its relative, the tapir, it is fond of wallowing in the mud. Though possessed of great strength, and a match for either the tiger or the elephant, it is quiet and inoffensive unless provoked. The female

African Rhinoceros (*Rh. bicornis*).

produces one at a birth. The growth of the young is very gradual, as, at the age of two years, it scarcely attains half the height of the adult, which is usually about five feet at the shoulder; such a specimen will measure about 9½ feet from the snout to the root of the tail. The sight of this rhinoceros is by no means acute, but, on the contrary, its senses of smelling and hearing are very keen. Its chief food is canes and shrubs. The flesh somewhat resembles pork in taste, though of a stronger flavor and coarser grain. It can be successfully hunted only by the aid of elephants, and is now protected by law against extermination. It lives well in captivity, and specimens may be seen in many zoological gardens, but it does not breed in captivity.

The Javanese or Sondaic rhinoceros (*Rh. sondaicus*) is distinguished from the Indian species by smaller size, shorter horn, and differences in the disposition and tessellated appearance of the skin-folds, which is also somewhat more hairy. It occurs in the Sunderbunds of India, in Bengal, and in the Malayan Islands. The Sumatran rhinoceros (*Rh. sumatrensis*) is well distinguished by having two horns, the rear one like a big knob, and in being clothed with a comparatively thick coat of hairs. Its range is similar to the Sondaic species, but it also extends to Borneo. A variety living in the Assamese swamps has been called the hairy-

eared rhinoceros (*Rh. lasiotis*). The upper lip of this species forms a short proboscis and it gets its food mainly by browsing shrubs.

The African rhinoceroses are two, both differing from the Asiatic group in dentition, and in the absence of the armor-like plates and folds in the hide, which is hairless and lead-colored. Considerable variation exists, so that half a dozen or more distinct forms have been named, but all seem referable to two species,—the ordinary widespread African rhinoceros (*Rh. bicornis*), and the square-mouthed (*Rh. simus*). The former is to be found, except where killed off by civilization, throughout all southern and eastern Africa outside of the equatorial forests, and it does not show the fondness for swamps which characterizes the Asiatic congeners. Its front horn is broad and raised as on a base, sharp-pointed, and curved slightly backward, while the hinder horn is usually shorter and more conical. The head is rounded. This animal appears to be of ferocious disposition, and is quick and active, and greatly feared by the natives. The food consists largely of roots, which it digs out of the earth by aid of its horn. The side of the horn is thus frequently rubbed by contact with the earth. This long horn may attain a length of 3 to 3½ feet, and straight ramrods are made from it. The lip is somewhat pointed and prehensile, and the animal browses much of the time. It is justly regarded by hunters as one of the most dangerous animals in the world to meet, and it often charges from ambush, or dashes frantically through a camp, so that many persons have lost their lives by it outside of chosen encounters.

The square-mouthed, white, or Burchell's rhinoceros is a northerly, and now almost extinct species (*Rh. simus*), which dwelt in East Africa and was distinguished by its huge size, a male standing 6½ feet high at the shoulder, with the front horn 50 or more inches in length. Its muzzle is short and square, the upper lip being short and its food consisting altogether of grass. Its general habits otherwise are similar to those of the other species.

Fossil Rhinoceroses.—These animals begin to be recognizable toward the end of the Eocene Period, both in Europe and North America; but the first form of which much definite knowledge is possessed is *Hyracodon* of the Lower Miocene (White River beds) of the eastern slope of the Rocky Mountains. This was a comparatively small, slightly built animal with a longer neck and limbs than later rhinoceroses show, and no trace of a horn is perceptible. Like other early forms it was tridactyl, but in some a rudimentary fourth toe (the 5th) remains on the fore foot. "In North America," says Woodward, "a normal horn does not appear ever to have been acquired, and the race disappeared before the close of the Pliocene. . . . In the Old World, however, the gradual development of the horn can be clearly traced." The earliest definite European remains are of a hornless rhinoceros (*Aceratherium*), which seems to have ranged over all Europe and Asia, and very similar species lived simultaneously in western North America. One of the latter (*Diceratherium*), of small size, had two callosities on its nose side by side, and four digits in the front foot. Typical horned rhinoceroses are to be traced as far back as the middle of the

RHINOCEROS-BIRD — RHODE ISLAND

Miocene, and they had all the essential features of the modern ones, and no one-horned fossils have been found outside of the Indo-Malayan region. The upper Pliocene species bore horns so large that the septum between the nostrils was ossified for their support. This feature is noticeable in the species (*Rh. leptorhinus*) common in England in the time immediately subsequent to the Ice Age; and reaches its maximum in the great woolly rhinoceros (*Rh. tichorhinus*), whose bones are found in the cave deposits and river gravels from Great Britain to China, and whose mummified remains have been taken, like those of the mammoth, from the ice-cliffs of arctic Siberia. It had immense horns and was covered with dense woolly hair. Another huge, but aberrant rhinoceros (named *Elasmotherium*) roamed over Russia and northern Asia at the same Pleistocene period, which was sometimes 15 feet long, and bore an immense horn rising from between the eyes.

Bibliography.—Consult authorities on zoology and sport in India, especially Blanford, 'Mammals of India' (1888); and in Africa, especially the writings of Selous and Baker; Flower and Lydekker, 'Mammals Living and Extinct' (1891); Woodward, 'Vertebrate Paleontology' (1898).

Rhinoceros-bird, some bird, especially a small white egret, which perches upon the rhinoceros when at rest, searching his hide for ticks and other insects, and warns him by its cries of the approach of any intruder. Compare BURFALO-BIRD.

Rhinocopy. See NOSE AND THROAT.

Rhio, *rĕ'ō*, or **Riouw**, *rĕ-ow'*, a seaport belonging to the Dutch, in the Indian Archipelago, on the islet of Tandjong Pinang, in a bay on the south side of the Island of Bintang, 50 miles southeast of Singapore. It is the capital of a Dutch residency, comprising the Rhio Archipelago, the Linga group, and the Tambelan, Anambas, and Natuna Islands, as well as the districts of Kampar, Siak, and Indragiri, on the east coast of Sumatra. The population of the residency is estimated at 108,000.

Rhi'zome, or **Rootstock**, in botany, a sort of stem found in herbaceous perennials, running along the surface of the ground, or partially or wholly subterranean, sending forth shoots at its upper end and decaying at the other. It occurs in the ferns, iris, etc.; and in the ferns it may be wholly covered with the soil. In the mints, the sand-sedge, couch-grass, and other plants the rhizome is long and slender, but in Solomon's Seal, iris, birthroot, etc., it is stouter. Unlike roots, rhizomes bear scaly leaves at the nodes, and they also send down fibrous roots. The stouter rhizomes may act as storehouses of food.

Rhode Island and Providence Plantations, one of the New England States, situated between lat. 41° 18' and 42° 3' N., and between long. 71° 8' and 71° 53' W.: bounded on the north and east by Massachusetts, on the south by the Atlantic Ocean, and on the west by Connecticut. The extreme length of the State from north to south is 48 miles, and the extreme width from east to west is 36 miles. The area is 1,250 square miles, of which 1,053 square miles, including the islands, are

land surface. The larger part of the State is hilly, but the general elevation is not great; the highest point, Durfee Hill, in the northwest of Providence County, having an altitude of 805 feet. The large inlet known as Narragansett Bay, ranging in width from 12 to 3 miles, and with lesser bays and inlets branching from it, extends 28 miles inland in a northerly direction. It includes a number of islands, Rhode Island, Conanicut, and Prudence Island being the largest. Rhode Island is 15 miles long and about 3 miles wide, and on it is situated the city of Newport, sometimes called the summer capital of the United States. Block Island lies nine miles from the coast. It is a hilly expanse of verdure-clad sand rising boldly from the Atlantic Ocean. The Great Salt Pond which was formerly enclosed within the island is now an open harbor, and other important improvements have been effected, making the island much more accessible and secure for steam and sailing vessels. The rivers of Rhode Island are small, but they supply the water used by great industrial establishments. The Blackstone and the Pawtuxet in the northern part of the State, and Pawcatuck in the south, are the principal streams. Three streams, the Wanasquatucket, Moshassuck, and West River, flow into the inlet known as the Providence River, which was in early times a widespread estuary, but which is now confined within narrow bounds. All the streams are rapid for the greater part of their course, and on some of them large dams have been built as reservoirs for the mills. These and the natural ponds add greatly to the picturesque effect of the scenery.

Climate.—The climate is mild, as compared with that of the greater part of New England. The mean temperature for January is 36° and for July 76°, and the humidity averages between 80 and 95 per cent throughout the year. The rainfall ranges from 40 inches in the northern part of the State to nearly 50 inches on the coast.

Geography and Minerals.—In the western part of the State the surface is chiefly composed of Archæan rocks, which in some places, as at Rocky Point, jut prominently into the bay. The bed of the bay itself, with its islands, and a large part of both shores, is composed of deposits from the Carboniferous period, but in the great terrestrial disturbances which geology tells us followed that period, the coal strata in the vicinity of Narragansett Bay underwent changes which greatly affected their value for use as fuel. Coal was discovered at Philipsdale, East Providence, some years ago; but the discovery was neglected until the recent high price of coal called attention to the mine as a possible source of local supply. It is claimed that the mine contains good hard coal, and can be worked profitably. A coal mine in Cranston, near Providence, which has been worked at intervals for many years, but never far from the surface, is being improved, and it is asserted that the quality is better the deeper the vein is followed. Excellent granite quarries are worked in different parts of the State, especially at Westerly, whence granite has been supplied for many notable monuments and buildings throughout the United States. Considerable deposits of magnetic iron ore are known to exist along the western edge of the Carboniferous

strata, and limestone is abundant in some parts of the State.

Agriculture.—Farming has not kept pace with other Rhode Island industries, the number of acres included in farms having decreased 17.8 per cent between 1850 and 1900. Much of this land taken from farms, however, has become sites for factories and villages, or been added to the suburbs of growing cities and towns. The average size of farms has decreased from 103 acres in 1850 to 83 in 1900, while the improved land of farms in 1900 is but a little more than one half as large as the improved area in 1850. This is due in some degree, doubtless, to the fact that many farms are occupied by persons who do not depend on them for a living, and do not cultivate their land to any extent. Farmers who do get a living from their land generally keep cows, and from these derive much, if not most of their income, and this accounts for the fact that hay and forage form the most important crop, occupying 69,776 acres in 1899, while corn in 1900 amounted to only 8,149 acres, and potatoes in 1899 to 5,817 acres. Cranston has probably the largest market-garden in the United States, and farmers raise considerable quantities of vegetables for the local markets, while fruit-raising is receiving increased attention.

The number of dairy cows kept is very large, being 23,660 in 1900, while the number of sheep has diminished from 11,400 in 1890 to 6,629 in 1900, owing to the increasing difficulty of keeping sheep where dogs are numerous, as in the vicinity of factory towns, and also because their care on a small scale in the East is no longer a sufficiently profitable occupation in competition with the large flocks of the West.

Fisheries.—Oysters, scup, menhaden, and squeteague are the most important products of the Rhode Island fisheries, which employ about 1,700 persons, and approach in value one million dollars annually. The fisheries of Narragansett Bay were menaced for a number of years by the pollution of the upper part of the bay with the sewage from Providence. This evil has been greatly alleviated, if not altogether removed, as a result of the methods of clarifying sewage recently adopted.

Manufactures.—Manufacturing is the leading industry of Rhode Island, which ranked second in 1900 in the production of cotton goods, and third in the manufacture of woollens, which last-named industry is giving way to worsted and knit goods, in which large fortunes have been made by manufacturers who had the discernment to note the change in popular taste.

Rhode Island is the parent State of cotton-spinning in America. English laws forbade anyone making a model or drawing of English cotton machinery, and sending it out of the country. Samuel Slater, an apprentice to cotton-spinning under Strutt, partner of Arkwright, the great inventor of spinning machinery, mastered the improvements on which he was employed, and came to the United States. Moses Brown invited him to Rhode Island. Slater went, and with the aid of Moses Brown's wealth he succeeded in producing by the close of 1790, at Pawtucket, R. I., cotton-yarn equal to the best made in England. Cotton-spinning became a great Rhode Island industry, and continued to be the leading industry until

the attention of manufacturers was turned largely to woollens and worsteds. In 1900 the number of cotton spindles in the State was 1,920,522. The dyeing and finishing of textiles, the silk and silk goods industry, and the manufacture of rubber boots and shoes, and of electrical apparatus are also among the important and growing industries of the State. In the manufacture of the cheaper quality of jewelry Rhode Island stands first in the United States. In solid silverware the State has no superior. The iron industries are flourishing, and include locomotives, Corliss engines, screws—the gimlet-pointed screw being a Rhode Island invention—and all varieties of metal tools. The number of persons engaged as wage-earners in manufacturing in 1900 was 96,528, of whom 26,984 were women, and 5,036 children under 16 years of age.

Banks.—The Providence Bank, founded in 1791, is the oldest Rhode Island bank. The Providence Institution for Savings dates from 1819. The banking institutions of Providence include 36 national, 3 state banks, and 24 savings banks. The national banks had a total capital, according to the report of the Comptroller of the Currency for the year ending June 30, 1903, of \$12,305,000; surplus, \$3,788,000; cash, etc., \$1,523,000; loans, \$27,472,000; deposits, \$19,154,000. The state banks had capital of \$395,000; no surplus; cash, \$92,000; loans, \$1,003,000; deposits, \$735,000. The savings banks had surplus \$3,338,000; cash, \$2,343,000; loans, \$31,789,000; deposits \$71,900,000. A very large share of the banking business is in the hands of trust companies, with large capital and surplus. Since the liquidation of several banks carried down in the failure of A. & W. Sprague, 30 years ago, no suspicion has been attached to the solvency of Rhode Island financial institutions.

Railways.—The New York, New Haven & Hartford Railway controls the more important steam lines within the limits of the State, and the railway mileage was 209 miles in 1900. After many years of controversy over location and terms for the disposal of the Cove lands, a Union Station was erected in the city of Providence which added greatly to the convenience of travel in the State. A complete system of electric lines extends throughout the State.

Commerce.—The export commerce from Rhode Island ports is insignificant. Foreign imports at the port of Providence for the year ending 30 June 1901, amounted in value to \$1,146,511, and there are customs districts also at Newport, Bristol, and Warren. Congress has made liberal appropriations for the improvement of harbor facilities at Block Island. The wharves at Providence and other ports which once gave room to Indiamen, whalers, and privateers now accommodate steamers and other vessels used in the coastwise trade and summer travel. The boat-building industry of Bristol is known the world over on account of the Herreshoffs, who have constructed several successful defenders of the America's Cup. Narragansett Bay has become a pleasure resort from Providence River to Newport in the east and Point Judith in the west, and in this way a large amount of money is brought into the State, while wealthy men from New York and else-

RHODE ISLAND

where, with summer homes in Rhode Island, have selected the State as their legal residence, and pay personal taxes there.

Finance.—Since the State recovered from the financial disorder occasioned by the War for Independence its credit has always been of the highest, and its obligations promptly met. The construction of the new State House at Providence, and other improvements due to the growing needs of the commonwealth have led to extraordinary expenditures within recent years, and in January 1903 the net indebtedness was \$2,475,935.48.

Population.—Rhode Island was the most densely inhabited State of the Union by the census of 1900, which gave 428,556 as the total population, or 407 inhabitants to the square mile. The population in 1890 was 345,506. The percentage of foreign population, that is, of residents of foreign birth, naturalized and unnaturalized, is very large, the total in 1900 being 134,509. The foreign element is chiefly of English, Irish, and Canadian origin, but the number of Swedes, Italians, and Russian Hebrews is increasing. The great majority of the foreign-born are employed in the factories.

Education.—Rhode Island has excellent public schools, supported by local taxation, and administered by local authority, and under the general supervision of a commissioner of schools. Education is compulsory, and while there is much illiteracy among certain classes of foreigners, parents, almost without exception, show eagerness to have their children educated. In 1900-1 the school population of the State was 85,084, of whom 69,087 were enrolled in schools. The large majority of teachers are females, the male teachers numbering only 9.1 per cent of the 1,960 employed in the schools in 1900-1, and the average monthly salaries were \$115.32 for the males and \$51.14 for the females, the difference being due to the fact that the males are usually in the more responsible places. The State Normal School at Providence is a handsome building, and the State also maintains a College of Agriculture and the Mechanical Arts. The leading educational institution of the State, and one of the best in the United States, is Brown University (q.v.). A private corporation in the State is having constructed a school-ship called "Young America," to give Rhode Island boys and such others as desire it a first-class nautical and preparatory education. The Rhode Island School of Design furnishes educational advantages in the arts of the highest order.

Religion.—The First Baptist Church of Providence, said to be the first in America, dates back to 16 March 1639. Roger Williams was one of its organizers. The Quakers were among the early settlers, seeking refuge from persecution in Massachusetts, and the Friends' School at Providence is one of Rhode Island's best-known educational institutions. The Congregationalists did not venture into Rhode Island until 1721, and while their proposal to come there was received with some bitterness by the descendants of those whom their ancestors had driven into the wilderness, they have become one of the leading denominations in the State. While Roman Catholics were as free to worship in Rhode Island as members of any other creed, it was not until 1813 or 1814 that mass was publicly celebrated in the city of Providence,

and the Church of Saints Peter and Paul was completed in 1838. The present handsome Cathedral stands partly on the site of the old church, and the Roman Catholic faith now includes one fourth the population of the State. The Baptists have almost one third of the total Protestant church membership, and the Episcopalians, who celebrated in 1872 the 150th anniversary of old St. John's Church at Providence, have about one fifth. The Methodists date back in Rhode Island to 1787, and have a large membership and prosperous churches. The Universalists settled in Providence in 1772, and have since had a prominent share in the religious life of the State, besides having been instrumental in fostering many important public charities. The Presbyterians are increasing in numbers, and have flourishing places of worship. Rhode Island contains its proportion of other sects and creeds, including the Jews, who were among the early settlers of Newport, where some of them achieved eminence.

State Government.—There are 33 towns and 5 cities within the State. The governor is elected for one year, and a lieutenant-governor, secretary of State and other State officers are elected for the same period. The governor presides over the Senate, has no veto power, and can pardon criminals by and with the advice and consent of the Senate. The members of the legislature, known officially as the General Assembly, are elected for one year. In the upper house, called the Senate, there is one senator from each city and town. In the lower house, or House of Representatives, every town, no matter how small, has at least one member, but as no town or city can have more than one sixth of the 72 members to which the house is limited, the representation is not proportionate to population. Members of the General Assembly are paid for actual attendance, with a maximum limit of 60 days. The House alone has the power to impeach, and the Senate tries cases of impeachment.

The judicial power is vested in the Supreme Court, and in such inferior courts as the General Assembly may from time to time establish. Preliminary examination of persons charged with serious crimes, and trials for minor offenses are held in the district courts, the justices of which are chosen by the General Assembly. The justices of the Supreme Court are elected by the General Assembly in grand committee, and continue in office until their positions are declared vacant by a resolution of the General Assembly. In practice this has meant election for life, or until retirement by voluntary resignation.

History.—The colony originally consisted, as the name indicates, of more than one community of independent origin, but to Roger Williams, the founder of Providence Plantations, history accords the distinction of having established the commonwealth. Providence Plantations was founded in 1636 by Roger Williams, who fled with several companions from Puritan persecution. He was of Welsh origin, and of respectable family, and his arrival in Massachusetts, 5 Feb. 1631, is recorded as "the coming of a godly minister." Williams soon showed that he had no sympathy with the Massachusetts principle of controlling through the civil government the consciences of men, and he frankly

RHODE ISLAND.

1. The State House, Providence.

2. The Old Stone Mill, Newport.

avowed his views in this regard. He thus incurred the censure of the Puritan magistrates and it was at first resolved to expel him from the colonial bounds, and when it was learned that he proposed to found another colony, it was determined to send him back to England. Williams received timely warning of this intention, and he fled into the wilderness with several companions, and at the opening of spring in 1636 he began to plant on the east side of the Seekouk River. He had five companions, William Harris, John Smith, Francis Wickes, Thomas Angell, and Joshua Verin. Here he was not allowed to rest, being notified by Plymouth Colony that the place was within their jurisdiction. Some time between the end of April and the latter part of June 1636, according to excellent authority, he proceeded around what is now Fox Point and up Providence River, landing at the site of the future town, and here he selected a dwelling-place for himself and his associates. His object, as set forth by himself, was "the settling of the plantation, and especially for the receiving of such as were troubled elsewhere about the worship of God." How faithfully that object was carried out Judge Story related in an address on Rhode Island delivered many years afterward. "In her code of laws," he said, "we read for the first time since Christianity ascended the throne of the Cæsars that conscience should be free, that men should not be punished for worshipping God as they were persuaded. He required a declaration which to the honor of Rhode Island she has never departed from."

The settlement on Rhode Island was at first a separate colony, but it also owed its origin to the example and advice of Roger Williams. John Clark and others of Boston went to Providence in 1638 in search of an asylum where they might enjoy liberty of conscience. Roger Williams advised them to purchase from the Indians the large island on the east side of Narragansett Bay, called by the Dutch "Roode Eylandt." This was done, and the adventurers, 18 in number, incorporated themselves as a body politic and elected William Coddington their chief magistrate. A third settlement was formed at Warwick in 1643 by a party of whom John Greene and Samuel Gorton were leaders.

Roger Williams perceived that the union of the weak settlements and the protection of the home government were necessary for their protection from the hostile and comparatively powerful Puritans, and in 1643 he went to England, and brought back in the following year a charter which united the settlements of Providence and Rhode Island under one administration, the name of the colony being Rhode Island and Providence Plantations. The new government went into operation in 1647, when the freemen of the several plantations met at Portsmouth, 19 May, and adopted laws for carrying on the civil government. This charter was confirmed by Cromwell in 1655, and in 1663 Charles II. granted the celebrated charter which remained for 180 years the supreme law of Rhode Island, both as colony and State, and gave place to a State Constitution in 1843 only after the civil convulsion known as the Dorr Rebellion gave notice that the people were determined upon a change. This charter fully recognized the prin-

ciple of freedom of conscience which was the cornerstone of the commonwealth.

The colony suffered greatly in the war with King Philip. Providence was burned, and the outer settlements were laid waste, and settlers murdered. The Great Swamp Fight, on Rhode Island soil, broke the power of the hostile Indian confederacy, and when King Philip was slain by treachery in the fastnesses of Mount Hope, the red men ceased to be a menace to the security of the settlements.

When Sir Edmund Andros was made governor of New England by James II. he sought to take away the colonial charters, and in 1687 attempted to seize that of Rhode Island, but in some mysterious manner it disappeared and was not found until the accession of William and Mary in 1689. Roger Williams had died in 1683. Notwithstanding the harsh treatment he had received from the authorities of Massachusetts he was ever ready to use his influence with the Indians in behalf of the colonies, and he was instrumental in disarming Indian hostility at times when the colonists were ill-prepared for defense. Although a strong controversialist, and bold and unsparing in his denunciation of those with whom he did not agree, he had a remarkable faculty of commanding the affection and esteem of men, as was signally shown in his ability to obtain for his colony the protection alike of Cromwell and of Charles II. He was exemplary in his private life, and altogether worthy of the reverence which posterity, without regard to creed, attaches to the memory of him whom Whittier has truly called "soul-freedom's brave confessor." He imprinted on Rhode Island a character which it has never lost, and which has been handed down through all the varying changes of population, of liberality and tolerance, of the Sermon on the Mount interpreted in the ordinary every-day actions of men.

The colony grew with a steady and wholesome growth, and religion flourished, although unsupported by the compulsory contributions of worshippers. The people were engaged in agriculture and commerce, and, in times of war, in privateering. During the struggle between Great Britain and France for empire in North America, Rhode Island took an active share in supplying troops and seamen, and the colony had 50 privateer vessels, manned by 1,500 sailors, at sea in 1756. The passion for privateering, with its excitement, its tests of courage and endurance, and prospects of rich reward, became so strong that when Esek Hopkins was commander-in-chief of the Continental navy, with his vessels at Providence, he found it impossible to man them, owing to the fact that privateering offered better inducements. The coast of the colony was infested with pirates in the early part of the 18th century, and some 30 of these ocean highwaymen were hanged at one time at Newport.

It was difficult in earlier years to obtain men to fill the minor public places, and laws were passed which remained on the statute-books for many years, providing penalties for refusal to accept office. This modesty on the part of the forefathers is easier to understand in view of the fact that the expenses of the town of Providence at the outbreak of the Revolution did not exceed \$1,000 a year.

RHODE ISLAND

The people of Rhode Island were among the foremost in defending American rights against the aggressions of George III. and his ministers. In June 1772 a band of volunteers commanded by Abraham Whipple, who had distinguished himself as captain of a privateer in the wars against the French, burned the British revenue schooner *Gaspee* in Narragansett Bay. During the greater part of the War of Independence Newport was occupied by the British, and on 29 Aug. 1778 a severe engagement was fought between the Americans, under Sullivan, and the British at Butt's Hill, R. I., in which the British suffered the greater loss.

Rhode Island was the last of the States to ratify the Federal Constitution, its assent not having been given until 29 May 1790, more than a year after the National government had gone into operation. As a small State Rhode Island was peculiarly jealous of its rights, and was slow to assent to its adoption. As the Constitution was first formulated and adopted by some of the original States there was room for a well grounded fear that the smaller States might be destroyed and absorbed through combinations of their more powerful neighbors. It was this fear mainly that caused Rhode Island to stand aloof from the combination, and it was not until that fear had been allayed by amendment to the original instrument that its adoption by the State was effected.

For some years after the Revolution the shipping of the State, being free from British restriction, became known in all parts of the globe then visited by vessels, and the foundations were laid of large fortunes afterward invested in manufacturing, when the shipping business declined. This change took place early in the 19th century, when New England's foreign commerce was practically ruined by the embargo, and when, on the other hand, the War of 1812 gave an impulse to domestic manufactures. Factories were established on every stream that afforded water-power, and Rhode Island grew in prosperity with her expanding industries.

The charter of Charles II., which continued to be the fundamental law of the State, restricted the right of suffrage to freeholders having an estate worth \$134, or renting for \$7 a year, and to their eldest sons. This was the cause of many wrongs, and of widespread popular protest. It was not uncommon for persons holding mortgages to threaten to foreclose them in order to influence votes, and the system gave rise to much intimidation and corruption. The conservative element strongly opposed a change, and when attempts to obtain reform through the regular course of legislation failed, representatives of the suffrage reform party met in convention and framed a constitution. They claimed that this constitution had been adopted by a majority of the adult male citizens of the State, and it was also alleged that a majority of those entitled to vote under the King Charles charter had voted in favor of the constitution. State officers and a legislature were chosen under this constitution, and organized with Thomas W. Dorr as governor. The charter officials, under Governor Samuel W. King, ignored the Dorr legislature and its enactments, and Governor King, at the head of a military force, dispersed the so-called insurgents. Dorr was

convicted of treason, and sentenced to imprisonment for life, but he was released some years later, and his sentence ordered expunged from the records of the State. A new constitution was adopted in regular form, and went into effect in May 1843. It retained the real estate qualification for foreign-born citizens, and this was not abolished until 1888. Another important change adopted within recent years was that permitting election by a plurality vote. This came into effect in 1893. When a majority was required the election was often thrown into the General Assembly, which sometimes chose a minority candidate. Until 1900 the State had two seats of government, the organization of the State government and one session of the legislature being held at Newport in May. Now all sessions are held in Providence, in the splendid new State Capitol.

As a manufacturing State, Rhode Island has been largely influenced by tariff interests in its attitude on National elections, and since 1856 it has always given its electoral vote to the Republican candidates. The Democrats have been successful several times within the past two decades, however, in electing their candidates for governor, and the present Governor, Lucius F. C. Garvin, is a Democrat. Rhode Island has adopted the so-called Australian ballot system of secret voting.

Political power is unequally divided. Each city and town, no matter how large or small, has but one representative in the Senate, or upper branch of the General Assembly, and the representation is also disproportionate in the lower branch. The city of Providence, with nearly one half the population of the State, and contributing nearly one half of the State taxes on general property, elects only about one eighth of the State legislature. In this respect Rhode Island is a miniature of the National government. It is also a singular fact that in Rhode Island's civil conflict, the Dorr "war," the northern part of the State chiefly supported one side, the Dorrists, and the southern part stood by the Charter.

In the Civil War Rhode Island supplied more than its quota to the National armies. General Ambrose E. Burnside, for a time in command of the Army of the Potomac, and whose equestrian statue is a conspicuous feature of the city of Providence, joined the service from this State, of which, however, he was not a native, and later was honored by its people by being elected governor and United States Senator. Rhode Island spared no expense in sending troops to the front, and since that great conflict has been generous in caring for her disabled and dependent defenders. The Soldiers' Monument opposite the City Hall in Providence (now about to be re-located), one of the finest in the United States, bears the names of the gallant dead who fell in defense of their country. In the Spanish-American War also, and the conflict in the Philippines, Rhode Island has been well represented.

EDWARD FIELD,
Author of the 'History of Rhode Island.'

Rhode Island, an island belonging to the State of Rhode Island; at the entrance to Narragansett Bay. It is separated from the mainland on the west by the estuary, Sakonnet River,

and is the largest island in the bay. The State was named after this island. It is about 15 miles from north to south and three and one half miles wide. It is divided into three townships: Newport, Portsmouth, and Middletown. It is a famous summer resort. Newport (q.v.), the city, is on the southwest coast.

Rhode Island, Battle of, an engagement which occurred 29 Aug. 1778. The British had seized Newport and garrisoned it with 6,000 men under Pigott. An attack was concerted by Sullivan and Lafayette on land and Count d'Estaing on sea. Sullivan seized Butts' Hill on the island of Rhode Island. Estaing was obliged to meet Howe and the English fleet, but battle was prevented by a fierce storm, and Estaing withdrew to Boston to refit. Pigott attempted (29 August) to carry Butts' Hill, and a bloody repulse of the British resulted; but on the arrival of Clinton with 5,000 reinforcements the Americans were compelled to evacuate the position.

Rhodes, rōdz, Cecil John, South African financier and statesman: b. Bishop's Stortford, Hertfordshire, England, 5 July 1853; d. Cape Town 26 March 1902. He was educated at the grammar school of his native town, but before he could pass on to the university, a serious affection of the lungs necessitated his departure for Natal, where an elder brother of his was engaged in cotton-raising. Rhodes landed in South Africa in 1870 and after a brief experience in farming made his way to the diamond fields of Kimberley, where he met with speedy and astonishing success. At 19 he was a millionaire and, with his health well recovered in the salubrious air of the veldt, he planned to return to England to resume his interrupted education. Before leaving South Africa he traveled for eight months, by ox-cart and on foot through the region north of the Orange and the Vaal, and his imagination, which even at that early age worked in vast spaces, saw in the fertile, thinly populated country, virgin soil for the building up of an imperial Britain in the Dark Continent. He matriculated at Baliol College, Oxford, in 1873, but his ailment returned and he was compelled to leave England in the same year. Three years in South Africa made him robust again and from 1876 on he kept his terms at the university, spending the long vacation in South Africa, and taking his B.A. and M.A. in 1881. In the same year Rhodes entered the Cape Parliament as member for Barkly West. By this time his plans for the future had assumed a definite character. Convinced, at all times, of the supreme fitness of the English race for the task of governing the world, Rhodes made it his object in life to further the realization of that end in his own especial sphere of South Africa. To aid him in his schemes he looked to money, in whose power he had a tremendous faith, and it is because of the close connection in him of the selfish money-getting instinct and the broad ambition of the statesman that Rhodes remained for many years an enigma to the world. In the Cape Parliament Rhodes devoted himself to the task of establishing harmonious relations between the English inhabitants and the Dutch, for with true insight he recognized that if British influence was to dom-

inate South Africa it must be conditioned by the good-will of the people of Dutch blood. The first step in his scheme of imperial expansion was the acquisition of Bechuanaland as a British protectorate in 1884. For this he labored against the indifference of the home government, which he finally stirred to action by his insistence upon the necessity of securing Bechuanaland as an outlet for the British trade to the north, already threatened by the encroachments of the Transvaal from the east and Germany from the west.

The annexation of Bechuanaland was a victory for Rhodes over Kruger, the astute president of the Transvaal, but the struggle between the two did not end there. When Boer commanders began to cross the Limpopo River, the northern boundary of the Transvaal, about 1887, Rhodes, to cut off their advance in that direction, obtained from Lobengula, king of the Matabele who were masters of the country between the Limpopo and the Zambesi, the exclusive right to search for minerals within his territories, and in 1889 the British South Africa Company was incorporated with almost absolute political and territorial powers over a vast, indefinite tract north of the Limpopo. In 1890 settlers were brought into the country and founded Fort Salisbury in Mashonaland, and at the same time the construction of a railway was begun which, running entirely through British territory, was to connect the new settlements with the Cape. Reading his title to Rhodesia, as the country was soon called, in liberal terms Rhodes (after 1893) extended the operations of the company north of the Zambesi as far as to the southern end of Lake Tanganyika, and though his dream of an "all red" map of Africa had been dissipated by the convention of 1889 with Germany, which allowed that country to stretch a barrier across the continent to the Kongo State, he did not abandon his scheme of a transcontinental telegraph line from north to south and a railway "from Cape to Cairo." Upon his political projects Rhodes spent vast amounts of money, partly his own, partly the funds of the De Beers Consolidated Mines, a corporation formed by him in 1888 and controlling the entire diamond output of the famous Kimberley mines. Of this company he was managing director.

In 1890 Rhodes became premier of Cape Colony. During his six years of office he gave special attention to his old policy of amalgamation between Dutch and British; he succeeded in winning the confidence of the former by his strong advocacy of full local government for Cape Colony, which he considered quite consistent with, and indeed, essential for, the scheme of imperial federation. It is this belief in a federal union of locally autonomous commonwealths that explains his gift of £10,000 to the funds of the Irish Home Rule party in 1888. In his treatment of the native races of Cape Colony Rhodes maintained the impossibility of granting them equal rights with the white population, but at the same time held it necessary to protect them by law against the temptations of civilization and exploitation by the whites. In Rhodesia a formidable outbreak of the Matabele in 1893 ended, after a bitter conflict, in their utter defeat and the absorption of their

territory by the Chartered Company. Successful everywhere, however, Rhodes was destined to fall before his old opponent, Kruger, of the Transvaal. The Jameson raid in 1895 destroyed Rhodes' personal power, although subsequent events fully vindicated his policy. Though the full truth of the Jameson affair may not perhaps be known, it is established that Rhodes, who was a large holder of mines in the Rand, plotted with other leaders of the Uitlanders in Johannesburg for the subversion of the Transvaal government; that a revolution was prepared in Johannesburg, and that Rhodes stationed Captain Jameson with several hundred men of the Rhodesian mounted police on the western border of the Transvaal to cooperate when necessary with the leaders in the mining town; and though it is also established that Jameson invaded the Transvaal without Rhodes' orders, the evil results of that unhappy affair may not unjustly be reckoned up against the premier of Cape Colony who abused the powers of his office to plot the downfall of a nation (see JAMESON, LEANDER STARR). A committee of the House of Commons acquitted Rhodes of responsibility for the raid, but censured his conduct as minister and director of the Chartered Company. Rhodes resigned the premiership on the last day of 1895 and thenceforth devoted himself to the interests of Rhodesia. A second war with the Matabele in 1896 was terminated by Rhodes' intrepid courage; the building of the trans-continental railway was rapidly pushed forward, and in connection with this undertaking Rhodes visited Europe in 1898-1900, carrying on negotiations with Mr. Chamberlain, the colonial secretary, and with the German emperor. During the Boer war, in its outcome the triumph and realization of his policy, Rhodes was besieged in Kimberley and took part in its defense. His health, however, gave way, and in spite of a trip to Egypt, his old disease finally conquered. In his lifetime Rhodes was the subject of infinite execration, as well as unlimited applause. Looked upon by different men as a statesman or a land grabber, a builder of empires or an unscrupulous speculator, he was all of these and more; and the anomaly of his character may, perhaps, be best explained if he be regarded as a man of great aims who let nothing stand in the way of their achievement.

Rhodes left the bulk of his great fortune for the establishment of a large number of scholarships at Oxford University to be apportioned as follows: Rhodesia, 9; Cape Colony, 12; Natal, 3; Australia, 18; New Zealand, 3; Canada, 6; Newfoundland, 3; Bermuda, 3; United States, 2 for each State and territory; Germany, 15. All but the German scholarships have an annual value of £300, and all but the last were intended to bring about that complete unity of the English speaking race whose destiny it is, Rhodes believed, ultimately to rule the world. Consult 'Vindex,' 'Political Life and Speeches of Cecil Rhodes' (1900); 'Imperialist,' 'Cecil Rhodes: a Biography and Appreciation' (1897); Hensman, 'Life of Cecil Rhodes' (1902).

Rhodes, James Ford, American historian: b. Cleveland, Ohio, 1 May 1848. He studied at the University of the City of New York and

also at Chicago University, his courses being principally confined to history, literature, rhetoric and metaphysics. In 1867 he went to Paris and attended lectures at the Collège de France, following which he pursued a course in metallurgy at the School of Mines in Berlin, and made a tour of inspection through the iron and steel works of Germany and Great Britain. In 1870 he entered his father's iron business in Cleveland and became a member of the firm in 1874. Having acquired sufficient wealth to enable him to adopt a literary career, he retired from business in 1885, and began the preparation of his 'History of the United States from the Compromise of 1850.' In 1891 he took up his residence at Cambridge, Mass., and the next year the first two volumes of his work were published. Five volumes have so far (1905) been published, carrying the work to the close of 1864. The author's design is to continue the history through the year 1885. The Loubat prize was awarded him by the Berlin Academy of Sciences in 1901.

Rhodes, Mosheim, American Lutheran clergyman: b. Williamsburg, Pa., 14 April 1837. He was graduated from the Susquehanna University, Selinsgrove, Pa., in 1861, was ordained to the ministry in that year and has since held charges in Pennsylvania and Ohio. He was president of the General Synod of the Evangelical Lutheran Church in 1885-6 and is an active promoter of religious educational movements. He has written: 'Life Thoughts for Young Men' (1879); 'Throne of Grace' (1887); 'Scriptural Giving' (1898); etc.

Rhodes, an island of Turkey, in the Aegean Sea, near the southwest coast of Asia Minor, from which it is distant about 11 miles. It lies between lat. 35° 52' and 36° 28' N., and lon. 27° 40' and 28° 15' E., and has an area of some 560 square miles. The island is crossed from north to south by a high mountain range which attains its extreme elevation in the peak of Atairo, the ancient Atabyron, with an altitude of 4,070 feet. Hills of a lower level traverse the island in all directions and are covered with coniferous trees, the considerable remnants of once splendid forests. Along the many mountain streams tropic plants grow in abundance, chief among them myrtles, oleanders and cactus. The soil is fertile and on the hillsides and in the valleys and plains, vines and olives, figs, pomegranates and oranges are grown. Wheat of an excellent quality is also raised, but not in sufficient quantities to form a commodity of export. Rhodes has been famous since ancient times for the mildness of its climate and its salubrious air. The winds show little variation. The value of the foreign commerce is about \$1,000,000, the chief articles of export being sponges, oil and fruit. The island forms a *savjak* or district of the Turkish province of the Isles of the White Sea, and its capital Rhodes (q.v.) is the seat of a pasha. The population is placed at 30,000 of whom two thirds are Greeks, about 7,000 Mohammedans and 2,500 Jews.

The original inhabitants of Rhodes are to us unknown but at the dawn of history we first find the island inhabited by a mixture of races from Asia Minor, and Phenicians, the latter of whom seem to have come from Crete. In the earliest period of Hellenic migrations Rhodes

was overrun by the Dorians who founded the cities of Lindus, Ialysus and Kamiyus, the sites of which may still be identified. These cities with the three Dorian cities on the mainland, Cos, Cnidus and Halicarnassus, constituted the so-called Dorian Hexapolis whose common shrine was the temple of Apollo Triopis on the Carian coast. The sun-god was at all times the favorite deity of the island and from one of his most common emblems, the rose, its name (*rhodos* in Greek, "rose") is said to be derived. The Rhodians were among the most enterprising traders in the Mediterranean and their colonies were found in Spain, in southern Italy and Sicily, and on the southern coast of Asia Minor. In 408 B.C. the inhabitants of the three ancient towns abandoned their homes and joined to form the new city of Rhodes (q.v.) which from now on was the capital of the island. The foundation of Rhodes exercised a tremendous influence on the development of the trade of the island. In the Peloponnesian war, Rhodes sided with Athens until 412 B.C., when it went over to Sparta. In 394 B.C., however, it returned to the Athenian allegiance. Occupied by the Macedonians during Alexander the Great's lifetime, it revolted after his death and defended its independence with splendid success against Demetrius Poliorcetes in 304 B.C. The island was now at the very height of its power; its commerce attained an unprecedented development and by means of its strong navy it made itself master of a strip of territory on the Asiatic mainland. The Athenian orator Æschines (q.v.) established a noted school of oratory in the city of Rhodes, which also became a great centre for the arts, especially sculpture and one of the leading university towns of the Roman world. Early in the 2d century B.C. Rhodes became an ally of Rome and enjoyed its favors. In 42 B.C. it was plundered by Cassius because it sided with Julius Cæsar, and in 44 A.D. it was united to the province of Asia. In 661 the island was taken by the Arabs, but was recovered by the Byzantines who in 1310 gave it over to the Knights of St. John. The latter held it against the Turks until 1522, when it was taken by Solyman II. In 1851 and 1856 the island suffered from severe earthquakes.

Rhodes, or Kastro, a town and the capital of the island of the same name, situated at its northeastern extremity. The modern town is of much smaller extent than the ancient city, but is still of imposing appearance. It is built in the form of an amphitheatre and is surrounded by walls and a ditch dating from the time of its occupation by the Knights of St. John, the memorials of whom constitute the most interesting features of the town. Among these are the hospital, the palace of the grandmaster and the cathedral of St. John, the latter two in a ruinous condition. The streets are tortuous, the most picturesque being the Knights' Street, which has preserved its mediæval appearance. The town has three ports, the one to the north, the central, and the southeast port; of these the central port is the only one practicable, but is in part choked up with sand. Near the harbor in ancient times stood the famous Colossus (q.v.). The population is about 11,500, mostly Turks and Jews.

Rhodes, Colossus of. See **COLOSSUS**.

Rhodes Scholarships. See **RHODES, CECIL JOHN**.

Rhodesia, rō-dē'zī-ā, South Africa, a British possession colonized in the last quarter of the 19th century by the British South African Company, founded by Cecil John Rhodes (q.v.), after whom it is named. It is bounded on the north and northwest by the Kongo Free State, on the west by Portuguese territory and Bechuanaland, on the south by Bechuanaland and the Transvaal, on the east by Portuguese territory and the British Central Africa Protectorate, and on the northeast by German East Africa. Total area, about 750,000 square miles. The river Zambesi, which traverses it from west to east, divides it into the two portions called Southern and Northern Rhodesia. Southern Rhodesia (area 174,728 square miles) consists of the two former districts of Mashonaland, capital, Salisbury, and Matabeleland, capital, Buluwayo. Northern Rhodesia is divided into two parts under separate administrators, namely Northeastern Rhodesia, headquarters, Fort Jameson, and Northwestern Rhodesia, headquarters, Lialui.

The river Limpopo forms the southern boundary, and the Matoppo Hills and their northeastern continuations form the watershed between the basins of the Zambesi and the Limpopo. Of the tributaries flowing north to the Zambesi, the most important are the Shanghani, Umfuli, and Panyame; and of those flowing south to the Limpopo the Buby, Tuli, Shashi, and Macloutsie. The whole country is a plateau varying in elevation from 3,500 to 5,000 feet above sea-level; and in Southern Rhodesia there are numerous mountain ranges, of which the chief is that of the Matoppo Hills already mentioned, Rhodes' burial-place. Of the individual peaks Mount Hampden near Salisbury, Hartley Hill, Mount Wedza near New Umtali, and Mount Inyanga are the best known. There appear to be no lakes of any importance apart from the great lakes on the frontiers of Northern Rhodesia (Tanganyika, Moero, etc.). The prevailing rock-formations are granite and metamorphic rocks, and rounded, projecting knobs of granite, often of fantastic appearance, form a striking feature in the scenery of many districts. The climate in the higher parts of the country is generally suitable for Europeans, but in the lower swampy parts and some of the river valleys malaria is prevalent, and the tsetse fly commits great ravages among cattle and horses. The area above 3,000 feet in Southern Rhodesia, most of which is adapted for the residence of Europeans, is stated at 100,000 square miles, and above 4,000 feet, where European children can be reared, there are 26,000 square miles. The summer season, from December to April, is characterized by great heat during the day and heavy rains, but during the rest of the year the weather is generally dry and much colder, especially in June and July. At Salisbury the mean July temperature is 57.5° F., the mean January temperature 70.5° F., and the extremes for the year are about 34° and 93°. The annual rainfall is about 33.8 inches, and falls on some 75 days. The soil in many parts is fertile, and the ordinary cereals, vegetables, and fruit-trees of Europe can be grown, in addition to the native crops of rice, tobacco,

india-rubber, and cotton. Extensive tracts of land furnish excellent pasture. Gold has been worked in Southern Rhodesia from ancient times, and there are striking remains at Zimbabwe (near Victoria) and elsewhere, of the works erected by the early miners. At the present time little, if any, alluvial gold is found, but quartz-reefs are being worked with more or less success in various parts of the country, especially around Gwanda, Buluwayo, Gwelo, Sebakwe, Victoria, Umtali, Mazoe, Salisbury, Hartley Hill, Lo Magonda, Abercorn, and Selukwe. The total output of gold for the year 1900-1 was 106,783 ounces, valued at \$1,919,900. Coal, iron, copper, silver, tin, plumbago, and kieselguhr have also been reported, and some of them are being worked. Southern Rhodesia is being rapidly opened up by means of railways, telegraphs, and roads. Buluwayo is in direct railway communication with Cape Town, 1,360 miles, and in 1899 the line from Salisbury to the Portuguese coast at Beira was opened for traffic. A line to connect Salisbury with Buluwayo is rapidly approaching completion, and other subordinate lines have been projected or begun.

The whole of Rhodesia, together with the treeless plain of Barotseland on the northwest, acquired in 1899, is under the administration of the British South Africa Company, which was incorporated by royal charter in 1889. Southern Rhodesia, however, is more directly under the control of the imperial government. The administration is carried on in accordance with the company's charter as amended by order in council of 1894 and 1898. The senior administrator, with headquarters at Salisbury, has an administrative council of six members and a legislative council of ten members, the latter including two elected representatives of each of the two great divisions of the province. The enactments of these councils are subject to the approval of the High Commissioner for South Africa, who acts through a Resident Commissioner. Jury trial was introduced in 1899. There are resident magistrates and judges, from whom an appeal lies to the Supreme Court of Cape Colony, and thence to the Judicial Committee of the Privy Council. Salisbury and Buluwayo have a regular municipal government, and doubtless this will be extended in time to the rising towns of Umtali, Gwelo, Tuli, Tati, Victoria, Wankie, Melsetter, Enkeldoorn, Charter, Gwanda, etc. The revenue in 1901-2 was \$2,176,200 and the expenditure \$3,552,800. The total native population of Southern Rhodesia is estimated at 510,000. The white population of Southern Rhodesia was 11,300 in 1901; of Northern Rhodesia, 164.

The chief tribe of original native inhabitants is that of the Mashonas, a peaceful and industrious race. In 1836 a Zulu people, known as Matabele, invaded the country under a chief called Mosilikatse, and easily conquered the indigenous inhabitants. For more than 50 years this warlike race held undisputed sway in Southern Rhodesia, and appear to have grievously oppressed the subject peoples, but in 1890 an expeditionary force equipped by the British South Africa Company occupied Mashonaland without opposition and founded the town of Salisbury. The Matabeles were for a time left undisturbed, but in 1893 their raids into Mashonaland gave the company an opportunity of

extending its authority. Three columns, one of them assisted by subjects of Khama, chief of the Bamangwato, advanced from the northeast, the east, and the southwest respectively upon Buluwayo, the capital of Lobengula, who had succeeded his father Mosilikatse as chief of the tribe. The Matabeles were easily overcome by means of the Maxim machine-guns, and fled to the hills. Toward the end of 1893 Lobengula sent overtures for peace, together with a sum of money, but the fatal cupidity of some men of the Bechuanaland police prevented these from reaching the company's officials. Accordingly the Matabeles who remained around the person of their chief, enraged by the supposed rejection of their overtures, surrounded a small party of Englishmen under Major Wilson, who, unable to escape, fought desperately till all were killed. Lobengula died early in 1894, and all resistance was at an end. Matabeleland has since formed a part of the company's dominion, but a serious native revolt, partly due to the ravages of rinderpest and locusts, broke out in 1896. Mashonaland also revolted about the same time, but both rebellions were peaceably settled by Cecil Rhodes' personal influence over the natives. Consult: Bent, 'The Ruined Cities of Mashonaland' (1893); Hall, 'The Ancient Ruins of Rhodesia' (1902); Hensman, 'History of Rhodesia' (1900); Knight, 'Rhodesia of Today' (1901); Leonard, 'How we made Rhodesia' (1896); Thompson, 'Rhodesia and its Government' (1898); Tort, 'Rhodesia Past and Present' (1897).

Rho'dian Law, an early system of marine law, said to have been compiled by the Rhodians after they had obtained the sovereignty of the sea. The only rule that we know now, though the entire code was adopted by the Romans under Antonius Pius, is the principle of general average: "If a cargo be jettisoned to lighten the ship, all contribute to make good the loss incurred for the benefit of all." The mediæval naval law of the Rhodians was not of Rhodian origin. It consisted of four distinct parts, of very different dates, but mostly of practical value.

Rho'dium, a metal belonging to the platinum group, discovered by Wollaston in 1804. It occurs in small quantities in various platinum ores; is a grayish-white metal; is very hard and infusible, scarcely softening in the flame of the oxyhydrogen blowpipe; and is unaltered in the air at ordinary temperatures, but oxidizes at a red heat. Insoluble in acids, it is readily oxidized by fusion with nitre. The specific gravity of fused rhodium is 12.1; its atomic weight is 103. The compounds of this metal have not been much studied.

Rhodochrosite, or **Dialogite**, native manganese carbonate. It is usually either cleavable-massive or in rhombohedral crystals of rose-pink or brownish-red color. Its lustre is vitreous to pearly; hardness, 3.5 to 4.5; rhombohedral, cleavage highly perfect. Its most important localities are in Hungary, Germany and Colorado, in which State many magnificent specimens have been found.

Rhododen'dron, a genus of shrubs and trees of the order *Ericaceæ*. About 200 species have been recognized, natives mainly of the cooler parts of the northern hemisphere. They

RHODOLITE—RHONE

are most numerous in eastern Asia; seven are indigenous to America. They are usually evergreen, have smooth simple leaves, and terminal umbel-like racemes of generally very showy flowers for which the plants are widely popular as ornamentals. A few species yield wood which is used in turning, and cabinet work, but more largely as fuel; the flowers of others are used in jelly-making, and the leaves of a few have been used medicinally. They are sometimes made to include azalea (q.v.) by some botanists, but are usually considered distinct, the azaleas being generally deciduous. Some species are only a few inches tall, others exceed 50 feet in height and 18 inches in diameter.

Rhododendrons are readily propagated by seeds, cuttings or layers usually under glass; but choice varieties are most frequently grafted upon seedling stocks. The seeds are very small and are generally sown in seed-pans during early spring in peaty, sandy soil. The seedlings are pricked off as soon as possible; the greenhouse kinds under glass, the hardy ones in cold frames until the following year, when they may be grown in nursery rows. When planted in the garden they should always be protected from heavy wind, and the full glare of the sun. The deep shade afforded by walls and hedges is, however, not generally desirable. They do not succeed well as a rule upon limestone, limy or clayey soils, but thrive best upon well drained, though moist loamy soils underlaid by porous subsoil. Since the roots lie close to the surface no cultivation can be given, but mulching may take its place. Pine needles, marsh or salt hay are specially desirable since they are free from weed seeds. Annual or biennial dressings of well rotted stable manure should be given. The seed vessels should be cut off when the flowers have fallen, to divert the plant food into new flower buds and to prevent the scattering of seed. The greenhouse kinds require very porous peaty soil, free watering during the summer, careful watering in winter, cold but not frigid quarters for the Himalayan species, and not less than 50° for the Javanese kinds which bloom and grow continuously and require more water also. These last also being epiphytes require still more open soil. They are exceptionally attractive when properly grown.

Among the American species the great laurel (*R. maximum*) is the largest, attaining a height of 30 feet or more. It is indigenous from Nova Scotia to Michigan and southward in the mountains to Georgia. In early summer when its rose or lilac flowers appear in profusion it is an imposing subject and is justly popular as a park specimen. If taken when small from loose soil in the woods it usually transplants well, but nursery-grown plants should be given preference. Though called *maximum*, several of the Asiatic species discovered since this was named are far larger. *R. catawbiense*, a species with lilac-purple flowers often 1½ inches in diameter, is one of the most beautiful of ornamental shrubs. It rarely exceeds 15 feet. In the mountains from Virginia to Georgia it is very common but in cultivation is well known as hardy in New England. It is one of the parents of a host of hybrid varieties of remarkable beauty.

R. ponticum, a native of western Asia and the Iberian peninsula, resembles *R. maximum* but

rarely exceeds 10 feet in height. It is considered less hardy than the preceding species, but is widely cultivated, especially in Europe. Several remarkably striking species were discovered by Hooker and other botanists in southern Asia, those of the Khasia Hills being especially noted. Only a few of these, however, have been introduced into cultivation and still fewer have been brought to America. Some have flowers four inches in diameter, others perfumed blossoms, and some are epiphytic in their habits.

Consult Bailey, 'Cyclopedia of American Horticulture' (New York, 1900-2).

Rhodolite, a beautiful light red variety of garnet (see GEMS), found only in North Carolina, highly prized as a gem, for which it has been extensively worked and sold within a few years past. The name is from the Greek *rhodon*, a rose, the color resembling some roses and rhododendrons, and unlike most garnets, becoming extremely brilliant by artificial light. Analysis shows that rhodolite is composed of two molecules of pyrope garnet with one of almandite garnet. It occurs intimately associated with the Cowee rubies (see RUBY) of Macon County, the crystals of the latter sometimes even enclosing the rhodolite. It is one of the most important gem-stones of North Carolina.

Rhodonite, a rose-pink or brownish-red triclinic mineral, essentially a manganese metasilicate, $MnSiO_3$. It usually contains some calcium and iron, while zinc is present in the variety fowlerite, which occurs at Franklin Furnace and Ogdensburg, N. J. in groups of magnificent crystals several inches in length. Sweden yields attractive specimens, and masses of much beauty associated with braunite are found at Cummington, Mass. Its most important occurrence is near Ekaterinburg, in the Ural Mountains, from which locality the Russians have for many years mined considerable quantities as an ornamental and semi-precious stone, for which purposes it is highly esteemed, being cut into pillars, mantels, table tops, jewel caskets, etc. Its hardness varies from 5.5 to 6.5. Crystallized specimens show an eminent cleavage; the massive forms are exceedingly tough, like jade.

Rhodope, rŏd'ŏ-pē, ancient name of a mountain chain (7,474 feet) extending along the borders of Macedonia and Thrace. The Turks call it Dospad Yailasi, the Bulgarians Despoto Dag, both titles having reference to the numerous (Greek) monasteries that stud its sides. Of these the most famous is the vast fortress-monastery of Rilo, in the northwest of the range, standing on its south side in the midst of magnificent pine forests. Rilo has for generations been the focus of the national Bulgarian Church and the mainstay of Bulgarian nationality.

Rhondda, rŏnd'da, a river and town of South Wales, in Glamorganshire. Its valley is the seat of a large population engaged in coal-mining and metallurgical industries. The inhabitants are employed mainly in collieries, iron-works, etc. Pop. (1901) 113,735.

Rhone, rŏn, a river of Europe which rises in Switzerland, near the east frontiers of the canton of Valais. Its precise origin is commonly said to be in the Rhone glacier, between Mount

Furca on the east, the Gallenstock on the north, and the Grimsel on the west, 5,581 feet above the level of the sea; but the natives give the name of Rhodan or Rotten to three springs situated in a single basin at the foot of the Mayenwand, at an elevation of 5,282 feet, the water of which flows with an equal temperature in summer and winter (61° to 63° F.), and these they consider to form the true source of the Rhone. The waters from these springs join the stream from the glacier at a very short distance from their origin. The young river dashes down with great rapidity into the valley beneath, leaping from cascade to cascade; traverses the centre of Valais in a westerly direction, and near Villeneuve enters the Lake of Geneva at its eastern extremity. On entering the lake its waters are surcharged with mud; but on issuing from it, at its southwest extremity, at the town of Geneva, it is of a pure deep blue color, soon after changed into a muddy brown by the accession of the glacier-born Arve, which joins it 1½ miles below Geneva. Proceeding southwest to the frontiers of the department of Ain in France, it turns almost due south, forming the boundary between that department and Savoy; then turning suddenly northwest, traces the boundary between the same department and that of Isère, and reaches Lyons. Here, having at least doubled its volume by the accession of the Saone, it proceeds almost due south, separating the departments of Rhone, Loire, Ardèche, and Gard on the west, from the department of Isère, Drôme, and Vaucluse on the east. On approaching Avignon it takes a more circuitous but still southerly course, separates the department of Gard from that of Bouches-du-Rhône, traverses part of latter department, and finally falls into the Gulf of Lyons in the Mediterranean. At Arles it divides into two branches, the less of which, under the name of old Rhone, flows southwest, forming the west side of the large delta, known by the name of the Ile de Camargue. The main branch, under the name of Grand Rhone, continues its southerly course, but again divides into two branches, and enters the sea by two mouths. Its whole course is about 580 miles, of which 200 miles are in Switzerland, and 380 miles in France. It is navigable for 360 miles. By means of a series of magnificent canals, the navigation of the Rhone has been continued, without interruption, to the Rhine (through the Saone), Seine, Loire, and Garonne.

Rhopalac'eræ, butterflies (q.v.); see also LEPIDOPTERA.

Rhubarb, Wine Plant, or Pie Plant, several species of perennial herbs of the genus *Rheum*, order of *Polygonaceæ*. They are natives of Asia and eastern Europe and have generally very large radical leaves with thick fleshy petioles, and small greenish or whitish flowers in racemes or paniculate fascicles which are borne on stout stalks well above the foliage. Several of the species are valued for bold effects in ornamental gardening, and some have been used in medicine, but the most important species is the common rhubarb (*R. rhaponticum*) which has long been cultivated in gardens for its tender, acid, esculent leaf-stalks which are largely used for making pies, sauce, and preserves in spring, and to a less extent for

home-made wine from the juice. The plants are usually propagated by means of divided roots, though seed is also used. They thrive best in rich, light, friable loamy soils, well drained but moist, and given liberal applications of manure of all kinds. The plants should be set not less than three feet apart each way, given clean cultivation until the foliage shades the ground, and mulched with stable manure during the winter. When two years old the stalks may be used freely. They are most easily gathered by bending them down while being pulled. The earliest stalks are obtained by inverting a barrel over the plants and heaping manure around it. But for forcing, the roots are dug in autumn, allowed to freeze, covered with earth or sand in cellars, under greenhouse benches, etc., and watered. After producing a crop the roots are thrown away. Large quantities are cultivated in the Southern truck gardens, but the forced stalks are considered superior and generally command higher prices.

Turkey rhubarb, formerly popularly used in medicine, is supposed to be derived from *R. palmatum*, but the exact species seems to be still undetermined. Chinese Tartary and parts of China were the principal shipping countries, but Asia Minor was also a producer.

Rhumb-line, a line described on the earth's surface by a ship sailing steadily in the direction of any one point of the compass, except one of the four cardinal points. A rhumb-line laid down on a map drawn on the principle of Mercator's projection is a straight line cutting the meridians at a constant angle; but if a rhumb-line be drawn on a globe, so that it will cut the meridians all at the same angle, it will be found to be a spiral curve such that however far it may be produced it will always approach the pole, but never reach it.

Rhus, a genus of the cashew-nut family (*Anacardiaceæ*). It is found all around the world, and the species are generally shrubs, with simple or compound leaves, and small five-merous flowers in panicles. The fruit is a dry, one-seeded drupe, often in conspicuous masses. Some, like the American staghorn sumac (*Rhus typhina*), with its tropical appearance and the smoke-tree (*R. cotinus*) are planted for ornament; and the *R. coriaria* is cultivated along the Mediterranean for its leaves, a valuable material for tanning leather, when a fine white color is desired, as in light morocco. The foliage of some other species is also gathered for the same purpose. The American aborigines used *Rhus* berries for red, and the juice for black dyes, and the bark of *R. glabra* is employed as a mordant for red colors. Oriental lacquer is made from juice exuding from incisions in the bark of *R. vernicifera*. Many species, including the *R. toxicodendron*, which, like *R. vernix*, is poisonous to the touch (see PLANTS, POISONOUS), are used in medicine, and the acid fruits of certain species are made into cooling drinks or sharpened vinegar. Chinese galls are produced by *R. semialata*, and candlewax is expressed from the berries of the wax-tree (*R. succedanea*), and from *R. vernicifera*, often planted in Japan, for that purpose. One or two species furnish a useful wood.

Rhyacolite, a variety of orthoclase, occurring in glassy crystals in the lavas of Vesuvius, Italy.

Rhyme, a stanza in which two or more lines end in a similar sound; also two or more final syllables having the same sound. Since rhyme, in the latter sense, is the most prominent mark of versification to-day, the word is usually understood to refer to the coincident sound at the ends of the verses. Rhyme was used, in a sense which has now become obsolete, to mark similarity of syllabification in other portions of the line than at the end. Thus the old writers speak of rhyming words when they mean words beginning with the same consonant, that is, in alliteration; also, in Spanish and Portuguese what we now call assonance—a coincidence of vowels in corresponding syllables, without regard to the consonants—was also called rhyme. Rhymes of to-day demand agreement in final syllables of the sound of the vowels and the succeeding or interposed consonants, if there are any, with a dissimilarity of preceding consonants, if there are any. Rhymes of such a character are of three kinds in English: single, or of one syllable, as *flap* and *slap*; double, or of two syllables, as *greeting* and *fleeing*; triple, or of three syllables, as *merrily* and *cheerily*. The single rhymes are often called *male*, and the double, *feminine* rhymes. The triple rhyme is used, in English, principally in verse of a conversational or comic or facetious nature. Rhymes of more than three syllables are practically unknown in all except the Persian language and its branches. In the perfect rhymes of to-day the preceding consonants, it has been stated, must not be the same; thus, *partake* and *lake* make perfect rhymes; but not *partake* and *take*, which makes an inelegance to the ear. The final syllables, moreover, of the perfect rhymes must both be accented; thus *butterfly* will not rhyme with *terribly*, although the final syllables are suited in other respects for rhyming. There are, however, rhymes which occupy middle ground—permitted by the exigencies of the occasion in which they are used (known as *poetic license*)—which are not to be tolerated in ordinary occasions or if frequently used. Such rhymes are those that nearly coincide in sound, and which do not offend the ear by failing entirely to do so. Thus *gone* may be rhymed with *alone* under poetic license. There is no rule by which a permissible imperfect rhyme may be determined and the only criterion is to be found in good usage as established by the better class of authors. Some languages incline more to the male rhyme, as the English, on account of its superabundance of monosyllables; others, as the Spanish and Italian, more to the female; the German and French possess an almost equal store of both. The female rhymes in French all contain an *e* mute in the last syllable; and from the beginning of the 16th century it has been the almost uniform practice among French poets in dramatic, heroic, elegiac, satirical, and other forms of poetry to make couplets of male rhymes alternate with others of female rhymes. In the ode combinations of rhymes are used, but always regular. When two successive lines rhyme they form a rhymed couplet, the measure used by Pope in his famous 'Essay on Man.' Three successive rhyming lines form a triplet; four a quatrain, but there may be two pairs of rhymes in a quatrain. Rhymes are used throughout poetry in accordance with the author's own taste

and inclinations. In some poetry every line is rhymed with some other. And this may be an adjacent line or one separated from its partner by one or more lines which do not end with the same rhyme, but with some other. The position of the rhyming pairs in the stanzas must be the same in each verse of the composition, and, moreover, within the stanzas the rhymes must occur regularly, according to some fixed scheme. In long poems, indeed, it is not infrequently the case that different portions of the poem employ stanzas in which the rhyme schemes differ. This is permissible because, on account of the length of the composition, the effect is the same as if it were composed of several shorter poems.

It is not necessary that every line in the poem should rhyme, and some of the pleasantest effects have been produced by the use of a mixture of rhyming and not-rhyming lines. When rhyme is totally absent poetry is spoken of as *blank verse*. The rhyme does not always occur only at the end of lines. It sometimes occurs at two places within the line, at the middle and at the end. But this is only a supplementary or secondary rhyme; it is not to be used except in conjunction with lines which have proper or terminal rhymes.

The rhyme scheme employed, in conjunction with the kind of measure used, determines the structural character of poetry (q.v.). The most complex forms now used in English are found in the sonnet (see *POETRY*) and in the Spenserian stanza, so-called because adopted by Spenser and used in his 'Faerie Queene.' There are a number of artificial forms of verse known as the French forms, because invented and brought to perfection by the poets of that nation, in which the positions of the rhymed lines vary greatly not only in the stanzas, but in the poem as a whole. The most commonly employed of these forms are the *triolet*, *rondel*, *rondeau*, *vilanelle*, and *ballade*.

The modern use of rhyme was not known to the ancient Greeks and Romans. We meet, indeed, with some rhymed verses in Ovid, in which the rhyme was evidently intentional; but these examples are rare. It has been used, on the other hand, from time immemorial among the Chinese, Hindus, Arabs, and other oriental nations. Rhyme began to be developed among western nations in the Latin poetry of the Christian Church. It is found used as early as the 4th century, and in subsequent centuries grew to common use in the writings of church officers and ecclesiastical students. The use of rhyme in the vulgar dialects of Latin was even more general than in ecclesiastical poems, as is shown by the poetic monuments of the Romance nations belonging to the 9th and 10th centuries. In the Latin poems of the Fathers of the Church of the 4th century rhymes are more frequently used. The most ancient relics of Teutonic and Scandinavian poetry are not in rhyme, but are distinguished by alliteration. The earliest use of rhyme in a Teutonic dialect is in Otfried's 'Evangelij,' written in Frankish, in the latter part of the 9th century. The oldest forms of rhymed verse are the couplet and the continuation of one and the same rhyme through a whole piece. The oldest poems of the Chinese, Indians, Arabians, and of other ancient peoples are rhymed; so are those of the Irish and the

Welsh. In the fragments of the earliest Latin poetry yet found, where the metre is accentual, not quantitative there is a marked tendency toward rhymed endings. This tendency was lost for a time under the influence of Greek poetry in which the measures are quantitative. Still the partiality for rhymes was not lost, as is proven by the verses of Ovid, and upon the decline of classicism (see ROMANTIC) they became common. An attempt at sustained rhymed verses can be found as far back as the 4th century, as evinced in the verses of Hilary. By the end of the Middle Ages rhymed Latin verse had reached its perfection. (See LOGOÆDIC VERSE.) For a general discussion of rhyme schemes and verse-forms consult G. L. Raymond's 'Rhythm and Harmony in Poetry and Music' (1895); Guest's 'History of English Rhythms' (1838); Parson's 'English Versification'; R. C. Trench's 'Sacred Latin Poetry.'

Rhymer, Thomas, the familiar name of an early Scottish poet, whose real name is supposed to have been Thomas Learmount. He flourished in the latter part of the 13th century at Ercildoune (modern Earlston), Berwick. To this day the name of Thomas the Rhymer is popularly known in Scotland as that of a prophet, who derived his powers from residence in Fairyland; and it is only through the discovery of the manuscript of a metrical romance called 'Sir Tristram' (supposed by Scott to be his work, though this is still a matter of dispute) that he has acquired a better claim to remembrance. A good edition of the 'Tristram' is that of M'Neill (Scottish Text Society, 1886). Consult also Murray's edition of the 'Romance and Prophecies of Thomas of Ercildoune' (Early English Text Society, 1875); Scott's 'Minstrelsy of the Scottish Border' (1806); and Child's 'Popular Ballads' (Pt. ii., 1884).

Rhynchocephala, rĭn-kō-sĕf'a-lā, a sub-order of very ancient prosaurian reptiles, fossil chiefly in the Old World Triassic, having much superficial resemblance to lizards, and perhaps in the direct line of ancestry, by way of *Sphenodon* which still survives as a key to the group. They were unarmored, terrestrial, lizard-like creatures, varying in length from a few inches to six or eight feet. Important genera are *Rhynchosaurus*, *Hyperodapedon*, *Homœosaurus*, found in Europe and India. The most remarkable genus, however, is *Sphenodon* (or *Hatteria*), one species of which is still living in New Zealand. See TUATERA.

Rhyolite, a silicious porphyritic rock resembling granite in chemical composition. The name was first given by Richthofen to igneous rocks in Hungary distinguished from trachyte mainly by a more varied texture and the presence of quartz. The western Cordilleras of America, as well as like regions elsewhere, contain rhyolite in vast areas. Rocks of the same or similar structural character are now known also under the names of liparite and nevadite. The rocks which petrographers formerly classed among felsites are now mainly described under the name of rhyolite, which includes a much greater number of varieties.

Rhys, rĕs, Ernest, English author: b. London 17 July 1859. He was educated at Bishop's Stortford and Newcastle-on-Tyne and in 1877 became a mining engineer. In 1885, however, he

turned his entire attention to literature and in 1887 made a lecturing tour in the United States. He was editor of the Camelot series of reprints and translations (65 vols., 1886-91), of 'The Lyric Poets' (12 vols., 1894-9), and other publications and has written: 'The Great Cockney Tragedy' (1891); 'Welsh Ballads and other Poems' (1898); 'Frederick Lord Leighton' (1898); 'The Whistling Maid' (1900); 'Celtic Lore' (1901); 'Ogam-inscribed Stones Preserved in Dublin' (1902); etc.

Rhys, John, Welsh Celtic scholar: b. Pont-erwyd, Cardiganshire, 21 June 1840. He was educated at Bangor Normal College for the teaching profession; kept a school in Anglesey till 1865, and in 1869 was graduated from Oxford. Continuing his studies at the Sorbonne and Collège de France in Paris, Heidelberg, Leipsic, and Göttingen, in 1871 he was appointed inspector of schools for Flint and Denbigh, and in 1877 professor of Celtic in Oxford University, becoming in the same year an honorary fellow of Jesus College, of which he has been principal since 1895. He was already known as a Celtic scholar before the publication, in 1877, of his 'Lectures on Welsh Philology' gave him a high reputation in this department of scholarship. Later works are: 'Celtic Britain' (1882); 'Origin and Growth of Religion as illustrated by Celtic Heathendom' (1887); 'Studies in the Arthurian Legend' (1891); 'The Early Ethnology of the British Isles' (1891); 'Inscriptions and Languages of the Northern Picts' (1892); 'Celts and Pre-Celts; The Welsh People' (1900), in collaboration with J. B. Jones; and 'Celtic Folk-lore' (1901). He has also edited various Welsh texts in conjunction with J. G. Evans.

Rhythm, rĭthm, in metrics, the measure of time or movement by means of a numerical proportion or harmony. In prose literature it follows no regular law, but consists in an arrangement of words in an expressive succession. This arrangement may at times approach the regularity observed in rhythm in verse; and the term prose-poetry has been applied to the prose in which such regularity is strongly marked. In poetry, rhythm is reduced to law, and consists in a regular succession of arses and theses (long and short; accented and unaccented syllables). This results in a precise cadence, or variety of cadences; modified, of course, by the pauses necessary to rhetoric. See PHRASE.

Rhytina. See SEA-COW.

Riall, ri'al, SIR Phineas, British military officer: b. County Tipperary, Ireland, 15 Dec. 1775; d. Paris, France, 10 Nov. 1850. He entered the British army as ensign in 1794 and became major in the same year. In 1804 he was attached to the 15th Foot, and in 1808-10 commanded a brigade in the West Indies. He was promoted major-general in 1813 and ordered to Canada to participate in the war against the United States. He served on the Niagara frontier and was chief in command in the campaign against General Jacob Broun in the following summer. He was defeated at Chippewa and at Lundy's Lane, being severely wounded and taken prisoner in the latter engagement. He was appointed governor of Grenada in 1816, was knighted in 1833, and in

1841 received full rank as general. Consult: Morgan, 'Sketches of Celebrated Canadians and Persons Connected with Canadian History' (1862).

Rialto, *rē-āl'tō*, (1) the principal bridge of Venice (q.v.), the only one spanning the Grand Canal. It consists of a single arch 90 feet in span and 24 feet high, and was built of marble at a cost of over \$500,000, in 1590. Two ranges of shops divide the bridge road into three narrow parallel streets. Shakespeare mentions the bridge and contiguous promenades as a rendezvous in 'The Merchant of Venice,' and the term has become synonymous with the meeting places of the theatrical profession in most populous centres. (2) The Rialto in New York was first applied to the section on 14th Street, between Broadway and Fourth Avenue; but has now extended to the west portion of Broadway, between 23d and 32d Streets.

Riazan, or **Ryazan**, Russia, (1) city, capital of the government of Riazan; on the Trubesh, a branch of the Oka. It is in an agricultural region; in which the chief product exported is rye. The chief manufactures of the city are woolen and linen goods, leather and needles. Nearby is the village of Grishina, in which are large cutlery works. Pop. (1897) 44,552. (2) The government of Riazan has an area of 16,254 square miles. It is drained by the Oka and its tributaries. The chief manufactures are cotton, linen, and woolen goods, and leather. Rye is the principal grain exported. Pop. (1897) 1,827,539.

Rib. The ribs are a series of flattened, narrow bones which together with the sternum in front and the vertebral column behind form the bony cage which encloses the thoracic organs and supports the muscular structures surrounding the chest cavity. In man there are 12 pairs of ribs, of which the first seven articulate directly with the sternum by means of their costal cartilages and are called the *true* ribs. The cartilages of the eighth, ninth, and tenth ribs join the cartilage of the seventh rib and are, therefore, termed *false* ribs, while the eleventh and twelfth ribs are free at their anterior extremities and are spoken of as the *floating* ribs. The seventh rib is the longest of the series, the others decreasing progressively in size to the first and to the twelfth. The seventh is considered the most representative rib, and is described as having an anterior or sternal extremity, a shaft, and a posterior or vertebral extremity. The sternal end is hollowed slightly to receive the cartilaginous prolongation by which it is connected with the sternum. The shaft is flattened and has an external and an internal surface. Its lower edge is slightly grooved to shelter the intercostal vessels and nerve which run parallel and close to it. The head presents two facets which articulate with the bodies of two adjoining dorsal vertebrae, and the neck is the short portion between the head and the beginning of the shaft. At the junction of the neck with the shaft there is a small swelling called the tubercle which has an articular facet for contact with the transverse process of the lower of the two vertebrae with which the head articulates, and a roughened area for the attachment of a ligament. The rib presents two curvatures, one around a ver-

tical axis, and the other about a horizontal axis, the effect of which is that the bone cannot be laid on a plane surface in such a way that both ends and the shaft between shall be in contact with it. The point at which the curvature is most acute is called the angle of the rib. Most of the ribs are so placed in the body that their sternal extremities are much lower than their points of attachment to the vertebral column, and through this arrangement as well as their peculiar curvature, when they are raised in inspiration the capacity of the thorax is increased both in its anteroposterior and lateral diameters. In some diseases, notably rickets (q.v.) and emphysema (q.v.) which are characterized by changes in the shape of the chest, the ribs undergo alteration in curvature. In children having rickets the anterior portion of the ribs sinks in so that the sternum becomes more prominent and the ends of the ribs may be enlarged and beaded, forming what is called the "rachitic rosary." If, in addition to rachitis there is present some respiratory obstruction from such causes as adenoids, nasal catarrh, etc., the "pigeon" or "keel" breast may result. In this the lateral compression is carried to a more extreme degree and the cross-section of the chest approaches the triangular shape with the apex forward. A funnel-shaped depression over the lower point of the sternum is sometimes caused by rickets, but may be congenital or due to the habitual pressure of a work bench or tools, as in cobblers, for example. In the emphysematous chest the ribs are thick and run more nearly horizontal so that an increase in the anteroposterior direction and outward bulging of the middle portion are caused, giving rise to the so-called barrel-shaped chest. The flat chest is the opposite of this, as its name implies, and has a short anteroposterior diameter. It is often associated with a tendency to pulmonary tuberculosis. Very rarely the ribs are more or less numerous than normal, but a not unusual deformity is the nonattachment of the anterior end of the tenth rib, so that it, too, is a floating rib. This abnormality is by some authorities considered as an indication of a tendency to neurasthenia. Fractures of the ribs are not infrequent injuries. Owing to the more sheltered position of the upper and the greater mobility of the lower members of the series it is most often the fourth to the eighth ribs that are fractured. Unless there is some complication, such as internal injury, the outlook is usually good. The treatment consists chiefly in immobilizing the side of the chest affected by adhesive plaster strapping. In treating collections of purulent fluid in the pleural cavity, it is often necessary for the surgeon to resect portions of one or more ribs in order to secure free drainage. See ANATOMY, OSTEOLOGY, THORAX.

Ribalta, (1) **Francisco de**, Spanish painter: b. in Castellon de la Plana, Valencia, about 1550; d. Madrid 12 Jan. 1628. Of the Spanish school of painting, he studied first in Valencia, and afterward in Italy, where he came under the influence of Raphael, Piombo, and the Carracci. Returning to Spain he was received with honor, and engaged to paint pictures for many churches and convents in Valencia. His work is remarkable for grandeur of conception, good taste in composition, freedom of drawing, and correct anatomical design, but like other Spanish paint-

ers he was an extremist, depicting alternately agony and ecstasy. Among his best pupils were his son Juan (q.v.), Ribera (q.v.), known as Lo Spagnoletto, and Gregorio Castenada. Of his paintings perhaps the best are: 'Dead Christ and Angels,' 'Saint Francis,' 'Blessed Soul,' and 'Lost Soul,' in the Madrid Museum; 'Saint Francis Embracing Christ,' 'Saint Peter,' 'Conception,' and 'Saint John Baptist,' in the Valencia Museum; 'Virgin and Saint John Returning from the Sepulchre,' at Munich; and 'Saint Joachim and Saint Anne,' 'Christ on the Cross,' and 'Magdalen at Sepulchre,' at Saint Petersburg. He also painted portraits of many prominent Valencians. (2) **JUAN DE**, his son, flourished about 1597-1628. He painted so nearly in his father's style that their works are often confounded. When 18 he painted the admirable 'Crucifixion' in the Valencia Museum. Among his works are: 'Saints John and Matthew,' 'Saints Mark and Luke,' and 'A Singer,' in the Madrid Museum; 'Pope Gregory the Great Celebrating Mass,' in the Dresden Museum; 'Jephtha's Sacrifice,' and the 'Martyrdom of Saint Catherine.'

Ribault, rê-bô, or **Ribaut**, Jean, French soldier and colonist in the New World: b. Dieppe about 1520; d. Florida 1565. A Huguenot, he was sent by Admiral Coligny to establish a colony of French Protestants in North America. He went out in 1562 with an advance party, with which he built a fortress at Port Royal in the present South Carolina. A garrison of 30, left by him in charge, finally mutinied, and, having slain their leader, set out in a crazy vessel for France. Half-famished, they were carried by an English cruiser to London. Ribault was made governor of a proposed colony in Florida in 1564, and sent out René de Laudonnière, who built Fort Caroline near the mouth of the St. John's. In May 1565 Ribault himself with seven vessels and a force of 300 set sail for the colony, where he arrived 28 August. A Spanish expedition under Pedro Menendez de Avilés, had, shortly after Ribault's arrival, begun work on intrenchments on the site of St. Augustine, and Ribault determined on an attack before the fortifications had been completed. His ships, however, were wrecked in a hurricane, and Menendez, marching overland, captured Fort Caroline and butchered almost all whom he found there. Ribault, with most of his force, was saved, endeavored to return, but was intercepted by Menendez, and with a portion of his followers were murdered. This ended the Huguenot colony in Florida. Consult: Gaffard, 'La Floride française' (1875); Parkman, 'Pioneers of France in the New World' (1885).

Ribbeck, Johann Karl Otto, German philologist: b. at Erfurt, 23 July 1827; d. 1898. In early life he went to Berlin, where he studied under Lachmann, Bopp, and Böckh, and from there to Bonn where he was a close student of the methods of Welcker and Ritschl. Having received his degree in Berlin and traveled for a year through Italy, in 1853, he returned to Berlin, where he entered Böckh's school. He then became a teacher, being called successively to Elberfeld, Bern, Kiel, Feidelberg, and finally, in 1877, to Leipzig, there becoming the successor of his former master, Ritschl. Ribbeck's works

are mostly confined to criticisms of Latin poetry and to classical character sketches and display a profound knowledge of the classics combined with a brilliant style of essay. Among them are: 'Vergelii Opera,' with prolegomena and critical notes (5 vols., 1859-69); 'Tragicorum Latinorum reliquiae' (1862); 'Cornicorum Latinorum reliquiae' (1855); 'Der echte und unechte Juvenal' (1865); 'Horace's Epistles' (1869); 'Zur Lehre von den Latein Partikeln' (1860); 'Die römische Tragödie im Zeitalter der Republik' (1875); Plautus's 'Miles Gloriosus' (1881); the biography of Friedrich Ritschl (2 vols., 1879-81); 'Geschichte der römischen Dichtung' (3 vols., 1889-92; 2d ed., 1897-1900); and the classical character sketches (which appeared in the *Rheinische Museum*, of which he became editor in 1876) 'Alazon' (1882), 'Kolax' (1885), and 'Agroekos' (1885).

Ribbed Vaulting. See **GOTHIC ARCHITECTURE**; **VAULT**.

Ribbon, a narrow web, generally of silk, used for tying and ornamental purposes. Ribbon-weaving is a special branch of the textile industries. In modern looms as many as 40 ribbons are simultaneously woven in one machine. Mixed fabrics of silk and cotton are now largely employed. See **SILK AND SILK INDUSTRY**.

Ribbon-fish. See **DEEP-SEA LIFE**.

Ribbon-snake, a garter snake (q.v.) of slender form and conspicuous stripes.

Rib'bonism, in Irish history, the name given a group of secret associations among the lower classes in Ireland throughout the half century extending from 1820-70, at its greatest height from about 1835 to 1855. Its origin and organization are alike wrapped in obscurity, but it appears in the beginning at least to have been political in its aims, and it seems probable that it grew out of the northern Defenders who banded themselves to oppose the Orange organization. Earlier associations with somewhat similar aims were the Whiteboys and the Threshers, and in particular corners of the island, the Carders, Shanavests, and Caravats. Though everywhere condemned by the Roman Catholic clergy, Ribbonism included none but Roman Catholics within its numbers, and it maintained its influence by a system of oaths and secret signs and passwords. One striking feature of Ribbonism, as distinguished from most Irish patriotic associations, was the fact that its adherents belonged exclusively to the very lowest and most ignorant classes, the humbler peasantry, farm servants, laborers, and petty shopkeepers, hardly even the smallest farmers or their sons apparently belonging to it in any part of Ireland. So far as there was any unity in its aims, it aimed at making itself a public conscience on all agrarian questions; but, the Ribbonism of one period and of one district was not the Ribbonism of another. In Ulster it professed to be a defensive or retaliatory league against Orangeism. In Munster it was at first a combination against tithe-proctors. In Connaught it was an organization against rack-renting and evictions. In Leinster it often was mere trade unionism. The name originated in a badge worn by the members.

Ribeiro, rê-bá'roo, **Bernardim**, Portuguese poet: b. Torrão, Alemtejo, about 1486; d. about

1550. He appears to have been a gentleman of the chamber at the Portuguese court and to have been involved in an unhappy love affair with Donna Joana de Vilhena, a relative of the king. He was one of the first to introduce in Portuguese literature the Italian pastoral style which has since prevailed in Portugal. Of his writings there are still extant five idylls and several lyrics beside his best known work, the pastoral romance 'Menina e Moça' (1554). Editions of the 'Obras de Bernardim Ribeiro' were published in 1645, 1785, and 1852, and in 1891 an excellent edition of 'Menina e Moça' with a 'Prefacio' was edited by Dom Jose Pessanha.

Ribeiro-Ferreira, fâr-râ'ê-râ, **Thomaz Antonio**, Portuguese poet: b. Parada de Gonta, Portugal, 1 July 1831; d. 1901. He was educated for the bar at Coimbra and in 1870 was appointed secretary-general of the Portuguese colonies. In 1878 was appointed colonial secretary, minister of the interior in 1881, and in 1885 and in 1890 was minister of public works. He was minister to Brazil in 1895-6. As a poet he attained high rank, his work exhibiting much grace and a fervid patriotism. His works include: 'Sons que passam' (1854); 'Vesperas' (1858); 'Don Jaime' (1861); 'Delfino do Mal' (1868); 'Dissonancias' (1890); etc.

Ribera, rê-bâ'râ, **José** or **Jusepe de** (known as "Lo SPAGNOLETTO"), Spanish painter: b. Jativa, kingdom of Valencia, 12 Jan. 1588; d. Naples 1656. Although early entered at the University of Valencia, he preferred the studio of Francisco de Ribalta (q.v.) to the schools of book-learning. He eventually left Valencia for Naples, and thence took up his residence at Rome, where he was given the name of Lo Spagnoletto, "the Little Spaniard." Here he studied the works of Raphael and the Caracci. He also visited Parma and Modena and copied the paintings of Correggio. It is, however, very evident that while he was at Naples Cavaraggio exercised a preponderating influence over his style, and, though a Spaniard, he must be ranked as one of the most pronounced representatives of the Naturalistic School of Naples. Pedro de Madrazo calls him "a most excellent painter, who finds his place among the greatest Italian masters." Both in coloring, chiaroscuro and anatomical knowledge he excels many of the Neapolitan school; but he generally chose gloomy, austere or revolting subjects for his powerful brush, and these he treated with a wild and extravagant fancy which deepened the horror each incident inspired, such are his 'Prometheus Chained to the Rock'; 'The Torment of Sisyphus'; 'The Flaying of Saint Bartholomew'; 'Saint Sebastian Transfixed with Arrows' (all in the Prado Museum, Madrid); 'The Martyrdom of Saint Lawrence' (Dresden Gallery). His etchings, of which he has left 26, are mostly figure pictures of great spirit and power. He had a great number of pupils and imitators, among whom were Salvator Rosa and Lucio Giordano. Consult: 'Diccionario historico de las bellas artes' (1800); and 'Diccionario Enciclopedico Hispano-Americano' (1895).

Ribot, rê-bô, **Alexandre Felix Joseph**, French statesman: b. Saint Omer 7 Feb. 1842. He was educated at the Lycée of St. Omer and studied law in Paris where he was admitted to the bar in 1863. He entered public official life in

1870 and in 1878 entered the Chamber of Deputies for Boulogne-sur-Mer. He was minister of foreign affairs in the cabinet of de Freycinet, 1890-3, assisting in forming the alliance between France and Russia, concluded during that period. In January 1893 he was made president of the cabinet and held this office during the investigations of the Panama scandals; also again in 1895 after the election of Faure as president. He was superseded by Bourgeois in October of that year. His most important speeches have been on finance, foreign affairs, and freedom of education. In the latter cause he took a position opposing the recent persecution of the religious orders and published in 1900 a work entitled 'Reforme de l'Enseignement secondaire' embodying his observations as chairman of the committee appointed to make inquiry into the state of secondary education. He has also published 'Biographie de Lord Erskine' (1866); and 'Acte du 5 Août 1873 pour l'Etablissement d'une Cour suprême de Justice en Angleterre' (1874).

Ribot, Augustin Théodule, French painter: b. Breteuil (Eure) 8 Aug. 1823; d. Colombes 11 Sept. 1891. His only schooling in art was obtained by copying pictures in the Louvre. His early works were household and kitchen scenes; 'Cooks'; 'The Dinner Hour'; 'Interior of the Kitchen'; 'The Merry Cook,' and 'Poultry.' After 1865 he painted religious subjects; but chose to interpret them by selecting scenes of modern life which he gave with a startling realism, 'Jesus in the Temple'; 'Saint Sebastian' and 'The Good Samaritan,' now in the Luxembourg gallery are examples in this vein. In his early days he was forced to practise his art during the night hours, and this no doubt confirmed his predilection for concentrated light and strong shadows. In this he is allied to masters of the Dutch school, while in the frank realism of his methods he is classed with Velasquez and Ribera. In later life he painted historical and genre subjects in addition to his earlier field of subjects.

Ribot, Théodule Armand, French psychologist: b. Guingamp 18 Dec. 1839. He was educated at the Lycée de St. Brienne and the Ecole Normal Supérieure, where he was graduated in 1866. He held the chair of philosophy at the lycée of Vesoul and at Laval, 1866-71, when he went to Paris and devoted himself exclusively to researches in experimental psychology in histological and physiological laboratories and in the insane hospitals. In 1876 he founded the 'Revue Philosophique,' and in 1885 began his courses at the Sorbonne. Since 1888 he has been professor of experimental and comparative psychology in the College of France. In his first work, 'La Psychologie anglaise contemporaine' (1870), he initiated a new school of psychological research in France. The method employed in this work he has consistently followed in succeeding ones. Ignoring all non-material elements in mental life, he seeks his results in the observation and measurement of nervous phenomena in the individual; and the comparison of observed psychological phenomena in races, in infants and in animals. His other works are 'Psychologie allemande contemporaine' (1879); 'Les Maladies de la Mémoire' (1881); 'Les Maladies de la Volonté' (1883);

'Les Maladies de la Personnalité' (1885); 'La Psychologie de l'Attention' (1889); 'L'Hérédité psychologique' (1893); 'Psychologie des Sentiments' (1896); 'L'Evolution des Idées générales' (1897).

Ribs. See ANATOMY; OSTEOLOGY; THORAX.

Ricardo, rī-kār'dō, **David**, English political economist: b. London 19 April 1772; d. Gatcombe Park, Gloucestershire 11 Sept. 1823. His father was a prosperous Jew, born in Holland, but settled in England since his youth, and a member of the stock exchange. The son was educated in England and later in Holland, but had no university training and entered his father's business at 14. He married early and conformed to the Christian religion, whereupon an alienation with his father necessitated his taking up business on his own account. In this he was immediately successful and made a fortune on the stock exchange, at the same time preserving an honorable reputation. In 1799 he became interested in Adam Smith's 'Wealth of Nations' and turned his attention to the scientific treatment of questions connected with banking and finance. His first contributions to the subject appeared as letters in the *Morning Chronicle* in 1809 and later appeared in a pamphlet entitled 'The High Price of Bullion a Proof of the Depreciation of Bank-notes.' The report of the bullion committee in 1810 coincided with the principles of Ricardo in its attributing the depreciation of the currency to excessive issues of the Bank of England and in recommending a resumption of cash payments. In 1816 Ricardo proposed a scheme for making bank-notes exchangeable for standard bars of gold bullion instead of coined gold. The scheme was adopted in 1819, but had to be abandoned on account of the temptation to forgery. In 1817 appeared his principal work, 'On the Principles of Political Economy and Taxation.' This work instead of being a historical or philosophical treatment of the general theme is rather a specialized examination of such factors as value, rent, wages, etc., and his contributions to these subjects, while not absolutely original, yet were for the first time stated with fulness and authority. His writings have had a profound influence upon modern doctrines, though his views are not now fully accepted. James Mill and J. R. McCulloch were his disciples. He retired from business in 1814, and in 1819 entered Parliament for the Irish borough of Portarlington. He held the seat until his death and contributed to important discussions of financial questions. Consult 'Life' by McCulloch (1846).

Ricasoli, rē-kā'sō-lē, **Baron Bettino**, Italian statesman: b. Florence 9 March 1809; d. near Siena 23 Oct. 1880. He first entered public life in 1847 when he submitted to the Grand Duke Leopold of Tuscany, plans of governmental reform which the latter saw himself forced to adopt. Ricasoli became mayor of Florence in 1847 and in the following year was elected to the Tuscan parliament, and helped to bring about the recall of the grand duke. After the battle of Novara (1849) and the restoration of Austrian influence he retired to private life and devoted himself mainly to the scientific study and practice of agriculture. When the revolutionary movement of 1859 compelled the

grand duke to flee, Ricasoli became minister of the interior and in August of the same year, dictator. He resolutely opposed all attempts at a restoration of the grand-ducal government and labored for the annexation of Tuscany to Sardinia, which was accomplished in March 1860. He was made, thereupon, governor of Tuscany and was a member of the first Italian parliament which assembled in 1861. In June he succeeded Cavour as head of the ministry and sought to carry out his predecessor's policy, but he could make no head against the opposition and in March 1862, made way for the ministry of Rattazzi (q.v.). He assumed office once more in the early part of 1866, conducted public affairs with ability during the war against Austria, but met with no success in his internal policy of decentralization and financial reform because of his inability to rally a parliamentary majority to his support. He resigned in April 1867, to be followed by Rattazzi, but remained a member of the chamber of deputies till his death, though taking no very active part in affairs. His 'Letters and Papers' were published by Tabarrini and Gotti at Florence in 10 volumes (1886-1894).

Ricciardelli, rēt-chār-dē'l'lē, **Daniele**. See VOLTERRA, DANIELE DA.

Riccio, rēt'chō, or **Rizzio**, rēt'sē-ō, **David**, Italian secretary to Mary Queen of Scots: b. Pincalieri about 1533; d. Edinburgh, Scotland, 9 March 1566. He was educated as a musician, and in 1561 went to Scotland in the train of the Marquis of Moretto, ambassador of the duke of Savoy. At first a singer in Queen Mary's private chapel, in 1564 succeeded Raulet as the queen's secretary. The causes of his elevation have been variously explained. Coincident with the event was Mary's determination to act in matters of state independently of the Scottish nobles or even of her uncle of Lorraine, and the supposition is natural that in Riccio Mary found a safer confidant than in her former French secretary. After the queen's marriage to Darnley in July 1565, Riccio rose even higher in the favor of Mary, and it was Mary's avowed intention to make him her prime minister. His intimacy with the queen aroused the jealousy of Darnley and his haughty behavior made enemies of the nobles. The conspiracy formed to remove the objectionable secretary was precipitated into action by Mary's refusal to pardon Moray and other exiles in England. Its leaders were the relatives of Darnley, Lord Maitland who had fallen from power, and leading Protestants including probably John Knox; with the English government standing as a neutral abettor. Riccio was dragged from the queen's supper-chamber in Holyrood palace and despatched with at least 56 wounds.

Rice, Alice Hegan, American humorous writer: b. Shelbyville, Ky., 11 Jan. 1870. She was educated at Hampton College, Louisville, Ky., and was married to C. Y. Rice, of Louisville, in 1902. Her first book, 'Mrs. Wiggs of the Cabbage Patch' (1901), attained extraordinary popularity, and was followed by 'Lovey Mary' (1903); 'Sandy' (1904).

Rice, Allen Thorndike, American editor: b. Boston, Mass., 18 June 1853; d. New York 16 May 1889. He was graduated from Oxford in 1875 and in 1876 purchased the 'North Amer-

ican Review' of which he became editor. He was one of the promoters of the Charnay expedition which in 1879 investigated the ruins of primitive civilization in Central America and Mexico. He was actively interested in politics, an earnest advocate of a more efficient copy-right law, and was chiefly instrumental in securing the introduction of the Australian ballot system into the United States. In 1889 he was appointed minister to Russia, but died before the date set for sailing. He edited 'Reminiscences of Abraham Lincoln' (1886) and contributed to 'Ancient Cities of the New World' (1887).

Rice, Edmund, American military officer: b. Cambridge, Mass., 1842; d. Wakefield, Mass., 20 July 1906. He entered the Union army in 1861, received rank as captain, was voted a medal of honor by Congress for bravery at Gettysburg, and was mustered out with rank as colonel in 1865. He entered the regular army in 1866, was promoted colonel and in 1877 served for a time on the staff of General Skobelev in the Turko-Russian war. He was appointed inspector-general in 1898, and in 1902-3 was colonel of the 19th Infantry. He was retired in 1903. The trowel bayonet, stacking swivel, and knife-intrenching bayonet now in use in the United States army were his inventions.

Rice, Isaac Leopold, American lawyer: b. Wachenheim, Bavaria, 22 Feb. 1850. Coming to Philadelphia with his parents in 1856, he was educated at the Boys' Central High School of that city, and showing a genius for music was sent to Paris to complete his musical training. In 1868 he visited England and taught there music and the languages for a year when he settled in New York, teaching music for a time and then entering Columbia Law School, from which he graduated in 1880, taking prizes in constitutional and international law. He founded the School of Political Science and was lecturer (1882-3), and subsequently instructor in the Columbia Law School (1884-6). He is a specialist in railroad law and was counsel and director in the lines now constituting the Southern Railroad, and for a time foreign representative of the Philadelphia & Reading Railway. He has taken an active part in the application of electricity to transportation and is prominently identified with many financial interests. He founded 'The Forum' in 1885 and is a leader in international chess. He has published 'What is Music?' (1875), and has written many articles in leading reviews.

Rice, James, English novelist: b. Northampton 26 Sept. 1843; d. Redhill, Surrey, 26 April 1882. He studied at Queen's College, Cambridge, without taking a degree, and in 1868 became editor and proprietor of 'Once a Week.' He was called to the bar in 1871 and while waiting for clients he became London correspondent for the *Toronto Globe*. His first literary success was with the novel, 'Ready Money Mortiboy' (1872), written conjointly with Walter Besant. The novel was dramatized and produced at the Court Theatre in March 1874. Other novels written in partnership with Besant were 'With Harp and Crown' (1874); 'The Son of Vulcan' (1875); 'The Golden Butterfly' (1876); 'The Monks of Thelema'

(1877); 'By Celia's Arbour' (1878); 'The Chaplain of the Fleet' (1879); 'The Seamy Side' (1881). Rice wrote also a 'History of the British Turf' (1879).

Rice, Wallace (de Groot Cecil), American literary critic: b. Hamilton, Ontario, 10 Nov. 1859. He was graduated from Harvard in 1883 and admitted to the Chicago bar in 1884. He has served as reporter and critic on various Chicago papers, and has published 'Under the Stars and Other Songs of the Sea' with B. Eastman (1898); 'Heroic Deeds' (1898); 'Flying Sands' (1898); 'Wild Animals' (1901); etc.

Rice, William Morton Jackson, American painter: b. Brooklyn 18 Feb. 1854. He graduated at Cornell University in 1874 and studied art under Carroll Beckwith in New York, afterward at Paris under Carolus-Duran. In 1886 he became a member of the Society of American Artists and in 1900 an associate of the National Academy of Design. He was awarded a bronze medal at the Pan-American Exposition, 1901.

Rice, William North, American educator: b. Marblehead, Mass., 21 Nov. 1845. He was graduated from Wesleyan University in 1865, and was professor of geology and natural history there 1867-84; and of geology after 1884. He was assistant geologist of the United States Geological Survey 1891-2, and president of the American Society of Naturalists in 1891. He has published 'Geology of Bermuda' (1884); 'Science Teaching in the Schools' (1889); 'Twenty-five Years of Scientific Progress and Other Essays' (1894); and an edition of Dana's 'Text-book of Geology' (1897).

Rice, Wild or Indian. See GRASSES IN THE UNITED STATES.

Rice-bird, in the United States the bobolink (q.v.), so called in the South Atlantic, where it is a serious pest in the late autumn to the rice crop; in the East Indies, a familiar and handsome finch-like weaver-bird (*Munia oryzivora*), also known as the Java sparrow and paddy bird. It possesses a large pinkish bill; the head and tail are black, the belly rosy, the cheeks of the male white, and the legs flesh-colored. It is dreaded in southern Asia on account of the ravages it commits in the rice fields, but is frequently brought to Europe and America as a cage-bird.

Rice Industry, American, The. The rice industry had its inception in America about the middle of the 17th century, when Sir William Berkeley made an attempt to raise rice in Virginia in 1647. As this experiment, which was continued for several years, was an utter failure, owing probably to the high latitude in which the seed was planted, it was generally believed that such a crop could not be grown in this country. The fact that this was an error was discovered accidentally, in 1604, when a vessel bound for Liverpool from Madagascar, was blown so far out of her course that, having been somewhat injured by the storm, it was decided to put into Charleston for repairs. Among those who boarded the vessel was Landgrave Thomas Smith, and, at his request, the captain gave him a small package of rough rice to be used as seed. Although little faith was expressed in the success of the experiment,

RICE INDUSTRY

Smith planted it in proper soil in lower Carolina, and his enterprise was rewarded by the growth of a crop that was almost sufficient to meet the needs of the entire colony.

From that day the success of the rice industry was assured. By 1707, the cultivation of rice had extended so widely that no less than 17 ships sailed from Carolina with cargoes of this grain, and, during the 10 years between 1730 and 1739, inclusive, the shipments to Great Britain and other ports amounted to more than 23,787,000 pounds. In 1754, the exports to England alone aggregated over 100,000 barrels of unhusked rice, which was equivalent to 30,000,000 pounds of the cleaned product, and yet the supply that was left was ample for home consumption. From that time until 1784, the yield remained practically the same, but, in that year, the system of water culture was introduced, an innovation which has since resulted in constantly increasing crops.

The following statistical table gives a clear idea of the condition of the industry from the beginning of the 19th century up to 1900, together with necessary information regarding the prevailing tariffs. For the sake of brevity these figures have been grouped in periods of five years, with annual averages. The table is as follows:

PRODUCTION OF RICE IN THE UNITED STATES FOR
105 YEARS, 1795 TO 1900, WITH TARIFF RATES
PREVAILING FROM 1789 TO 1857.

| Five years ending June 30 | Production for five years (Pounds) | Average per year | Tariff on Rice | |
|---------------------------------|---|---------------------|-----------------|--------------------|
| | | | Year enacted | Rate ad valorem |
| 1800..... | 320,631,803 | 64,124,361 | 1789 | 5 per cent |
| 1805..... | 240,044,600 | 48,008,920 | 1792 | 7½ " |
| 1810..... | 274,477,000 | 54,895,400 | 1794 | 10 " |
| 1815..... | 274,867,800 | 54,973,560 | 1800 | 12½ " |
| 1820..... | 282,397,800 | 56,479,560 | 1804 | 15 " |
| 1825..... | 333,447,000 | 66,689,400 | 1812 | 30 " |
| 1830..... | 417,333,600 | 83,466,720 | 1818 | 15 " |
| 1835..... | 457,282,200 | 91,456,440 | 1832 | Free |
| 1840..... | 424,585,600 | 84,917,120 | 1836 | 15 per cent |
| 1845..... | 481,669,200 | 96,333,840 | 1841 | 20 " |
| 1850..... | 543,404,400 | 108,680,880 | 1857 | 15 " |
| 1855..... | 483,279,600 | 96,655,920 | | |
| 1860..... | 545,592,600 | 109,118,520 | | |
| 1865..... | 115,718,680 | 23,143,736 | | |
| 1870..... | 160,837,790 | 32,167,558 | | |
| 1875..... | 276,704,430 | 55,340,886 | | |
| 1880..... | 415,332,000 | 83,066,400 | | |
| 1885..... | 534,720,400 | 106,944,080 | | |
| 1890..... | 675,950,400 | 135,190,080 | | |
| 1895..... | 762,608,460 | 152,521,692 | | |
| 1900..... | 738,142,520 | 147,628,504 | | |

The average per year as given under 1900 is much below the great yield of 1890, 250,280,227 pounds, or that of the following year, 285,750,000 pounds.

DUTY FROM 1861 TO 1897.

| Specific duty | Cleaned per pound | Un- cleaned per pound | Paddy per pound | Flour granu- lated | Ad valorem equivalent |
|------------------|-------------------------|--------------------------------|-----------------------|----------------------------|--------------------------|
| | Cts. | Cts. | Cts. | Cts. | Cleaned Rice |
| 1861..... | 1 | 1 | | | 41 per cent |
| 1862..... | 1½ | 1 | ¾ | | 48 " |
| 1864..... | 2½ | 2 | 1½ | | 94 " |
| 1876..... | Hawaiian Rice | | | | Free |
| 1883..... | 2½ | 1½ | 1¼ | ad val. 20% specific | 110 per cent |
| 1890..... | 2 | 1½ | 1 | 1 | 99 " |
| 1894..... | 1½ | 8-10 | 1 | 1 | 88 " |
| 1897..... | 2 | 1¼ | 1 | 1 | 80 " |

Although the superiority of American rice was a well-established fact long before the Civil War the success that planters have attained since 1865 has been indicated in a better quality of rice. In the old days, before the war, when Ward's famous "long grain Carolina" rice was the standard of perfection, Georgia and the Carolinas were the only States in which rice was grown to any great extent. In nearly all the other southern States its cultivation was merely for home consumption. Since the war, however, there has been a change in these conditions: Georgia and the Carolinas have retained their rice fields, but other southern States have evinced an increased interest in the cultivation of this product, Louisiana and Texas being particularly notable examples of the gigantic strides which this industry has taken.

The southern rice fields upon which the best commercial crops are grown are the reclaimed cypress swamps and the tide-water lands along the coast. Of course, many of the finest plantations are among the marshes higher up the rivers, or even in the interior upon level tracts that are so situated that they may be irrigated with ease. In nearly all of these plantations the system of water cultivation is followed. In the case of the tide-water lands, they lie along the rivers, above the meeting of fresh and salt water, in such a position that they may be flooded with water when the tide is high and drained at low tide. Thoroughly protected by dikes, the salt water, which is so fatal to the rice, cannot reach them from below, nor can freshets sweep them from above.

The serious check which this industry had received during the war was not forgotten immediately upon the declaration of peace. Lands there were in plenty, but there was no money to operate them, and it was not until incidental protection was derived from the tariff that any vigorous attempt was made to rehabilitate the old plantations. Since that time the greatest advancement has been made in Louisiana, and, during more recent years, in Texas.

The history of rice culture in Louisiana dates back to 1718, but, during all the years prior to the war, this industry was confined chiefly to the parish of Plaquemine. Experience had shown, however, that, in Louisiana, rice was a sure crop, upon which a fair price could be realized quickly without the outlay of a great amount of money, and so, in the uncertain days that followed 1864, it was to rice that the planters turned, with the result that a crop which had never been able to do more than supply a local demand, suddenly sprang into a position of national importance. So great and lasting was this impetus that, by 1875, the State of Louisiana was furnishing fully 30 per cent. of the total yield of the United States, while in each of the five years following 1880, it averaged 40 per cent.; 1885, 60 per cent.; 1890, 65 per cent.; 1895, 75 per cent., and in 1900, no less than 80 per cent. of the aggregate production of the country. In fact, the rice industry in Louisiana has developed to such a marvelous extent during the past 30 years that a statistical illustration of its progress is as important as it is interesting. Given in five-year periods, this is shown on the following page.

The stride that is shown in 1885 is largely due to the opening of an entirely new area to

RICE LAKE—RICH MOUNTAIN

PRODUCTION OF RICE IN LOUISIANA.

| Five years ending June 30 | Pounds | Average per year |
|---------------------------|-------------|------------------|
| 1865..... | 9,667,080 | 1,933,416 |
| 1870..... | 35,268,590 | 7,053,718 |
| 1875..... | 81,756,030 | 16,351,206 |
| 1880..... | 176,694,000 | 35,338,800 |
| 1885..... | 255,516,200 | 51,103,240 |
| 1890..... | 422,775,000 | 84,555,000 |
| 1895..... | 555,595,400 | 111,119,080 |
| 1900..... | 547,104,000 | 109,420,800 |

Prior to the war, the annual product was about 1,000,000 pounds.

the cultivation of this product. This portion of the State, which was known as the "Calcasieu Country" section, extended from the Atchafalaya River on the east to the Sabine River on the west.

It was the opening of this southwestern section of Louisiana that tended to call attention to Texas as a possible rice-producing State. There were good lands in plenty. All that was required was the experiment, for when it was made the result was so highly satisfactory that, although there was practically little rice grown in Texas prior to 1900, the report of the next five-year period will show such a complete change in the situation that Louisiana will no longer be able to boast of having raised such an enormous percentage of the aggregate yield, and as both southwest Louisiana and Texas offer a most promising field to investors who are able to develop the lands under the canal system of irrigation there is little reason to believe that either of these sections of the country have commenced to show what marvels they can perform as the great rice-growing centres of the Union.

Rice Lake, Wis., city, in Barro County; on the Red Cedar River, and on the Chicago, Milwaukee & Saint Paul railroad; about 45 miles north by west of Eau Claire. It is in a lumber region and the chief industries are connected with farm and lumber products. It has public and parish schools, a public library and private business schools. Pop. (1890) 2,130; (1900) 3,002.

Rice Paper, also called **Pith Paper**, and more properly, as the substance is not derived from rice. The product of a small tree, 10 to 15 feet high, known botanically as *Aralia (Fatsia) papyrifera*, which grows in many portions of Formosa. Japanese name, Tsuso; Chinese name, Tung Tsao. The pith is extracted by breaking the bark and outer woody portion, and forcing out the cylindrical core. Consul Jas. W. Davidson states that the paper is produced by skillfully paring these cylinders of pith with a sharp knife as they are rolled upon the surface of a tile or other hard substance that will serve as a bed plate, the thickness of the sheet of pith paper being regulated by the angle at which the knife is held. The sheets are put under heavy pressure for a time, and are finally cut into squares of 3½ inches, and packed 90 in a package. There are three grades of the paper, which is chiefly used for the manufacture of artificial flowers, and also for the painting of small fancy pictures, and to some extent for sun hats. Tamsui is the port of shipment, and as high as 28,000 pounds have

been exported in a single year, worth over 15,300 yen. See also PAPER.

CHARLES RICHARDS DODGE.

Rich, Edmund. See EDMUND, SAINT.

Rich Hill, Mo., city in Bates County; on the Osage River; and on the Kansas City, F. S. & M., and the Missouri Pacific R.R.'s; about 83 miles south of Kansas City. It is in an agricultural and coal region; in the vicinity of the largest coal fields in Missouri. Its chief industries are connected with the mining and shipping of coal. It has vitrified brick works, canning factories, a foundry, distillery, machine shops, and zinc smelters. It has an extensive trade in coal, farm products, canned goods, and brick. The principal public buildings are the churches and schools. Pop. (1890) 4,008; (1900) 4,053.

Rich Mountain, Battle of. After the reverse of Col. Porterfield at Philippi (see PHILIPPI, ENGAGEMENT AT) Gen. Lee ordered Gen. H. A. Wise to the Kanawha Valley and Gen. R. S. Garnett to the Cheat Mountain region. Garnett was to relieve Porterfield, recover lost ground, and secure control of the Baltimore and Ohio Railroad. With one regiment he arrived at Huttonsville on 14 June, where he found Porterfield with about 1,400 men. Leaving Porterfield at Huttonsville with three companies to guard his line of communication with Staunton, Garnett marched on the night of the 15th to Beverly, from which point a regiment, a company of cavalry, and two guns were sent by the Parkersburg road to the west foot of Rich Mountain, seven miles west of Beverly. Garnett, with the other regiment, two guns, and a company of cavalry pushing on to Laurel Hill, the northern extension of Rich Mountain, 17 miles northwest of Beverly. These positions were regarded as the gates to northwestern Virginia, and both were strongly fortified. By 1 July Garnett had nearly 4,000 men, including his reserve at Beverly and Huttonsville.

Gen. McClellan arrived at Grafton 23 June, and prepared to expel the Confederates from their positions and to enter the Shenandoah Valley. He had 20,000 men; 5,000 along the line of the Baltimore and Ohio Railroad; a brigade of over 3,000 and a battery, under Gen. T. A. Morris, were stationed at Philippi; and by 2 July the main column, under his own immediate command, was concentrated at Buckhannon, 24 miles west of Beverly. This column of over 10,000 men, with 12 guns, was organized into three brigades, under Gens. W. S. Rosecrans and N. Schleich, and Col. R. L. McCook. On 2 July Gen. J. D. Cox was ordered to cross the Ohio with a brigade, and co-operate with McClellan by moving up the Kanawha Valley against Gen. Wise. On 6 July Morris was ordered to march his brigade from Philippi to within a mile and a half of Garnett's position at Laurel Hill, and on the 9th McClellan had the three brigades of his own column at Roaring Creek, two miles from the west foot of Rich Mountain, where Lieut. Col. John Pegram was intrenched, with 1,300 men and four guns. Preparations were made to assault Pegram in front with Rosecrans' brigade, on the morning of the 11th, but on the evening of the 10th Rosecrans learned that Pegram's rear could be reached by a difficult route around his left, and proposed to

do it with his brigade. To this McClellan assented. It was arranged that Rosecrans should march at daybreak of the 11th, with about 1,900 men, gain the road in Pegram's rear, march down it and attack, and that at the sound of the engagement in rear McClellan would attack in front. Rosecrans, after a very hard march, made the turning movement, and coming to the road about 3 P.M., unexpectedly came under fire of musketry and artillery and was checked. Pegram had been warned of danger to his rear, and during the morning had sent two detachments to Hart's farm, at the summit of the mountain, with Maj. J. A. De Lagnel in command, who took with him a gun of his battery, and threw up breastworks for his 310 men. Rosecrans attacked, was at first repulsed, and it was not until after a sharp engagement of nearly two hours that he succeeded in driving the Confederates from position, just as Pegram was approaching with reinforcements and another gun. A part of the reinforcements became involved in the defeat, and Rosecrans captured the two guns. Nothing had been heard from McClellan, and knowing that a considerable body of Confederates was still near him, Rosecrans directed his men to lie on their arms until morning. Rosecrans lost 12 killed and 49 wounded. The Confederates had made a gallant fight, with a loss of 40 to 45 killed and about 25 wounded. The noise of the engagement had been heard in McClellan's ranks, and he prepared for an attack in front, but the long continuance of the artillery-fire on the mountain, and some cheering in Pegram's camp, impressed him that it had gone badly with Rosecrans, and the attack was not made, and near night he withdrew his troops beyond Roaring Creek. At daybreak of the 12th Rosecrans found that the Confederates had disappeared and, marching down the mountain, he entered Pegram's abandoned camp, taking two more guns, with some sick and wounded, and as nothing was seen of McClellan, he sent him word of what he had been doing and where he was.

The forces engaged with Rosecrans on the mountain top succeeded in passing around his right during the night to Beverly, where they were joined by the 44th Virginia, and the retreat was continued through Huttonsville and across Cheat Mountain to Greenbrier River, and then to Monterey. Pegram abandoned his works, intending to follow his detachment to Beverly, but in the darkness his column was broken up, part reaching that place. Pegram led the remainder to join Garnett, marching all day of the 12th, and halting at night in the valley six miles north of Beverly. There, hearing that Garnett had retreated northward, and that McClellan was at Beverly, and seeing no chance of escape, he sent to McClellan an offer of surrender. This was accepted, and next morning Pegram surrendered 30 officers and nearly 500 men. Garnett, at Laurel Hill, informed of the disaster that had befallen Pegram on the 11th, abandoned his works after dark, and retreated toward Beverly. When within five miles of the place, at daybreak of the 12th, he received erroneous information that McClellan had already occupied it, whereupon he retraced his steps and retreated north toward Saint George and West Union, hoping to escape by the Northwestern Turnpike, but was over-

taken by Morris at the fords of Cheat River, at noon of the 13th, and killed in a rearguard fight at Corrick's Ford. His army continued the retreat through Red House, Greenland, and Petersburg to Monterey. McClellan occupied Beverly on the 12th and Huttonsville on the 14th, and pushed his advance to the summit of Cheat Mountain. Leaving a force on Cheat Mountain and at Huttonsville he returned to Beverly on the 16th. A few days later McClellan was called to Washington and assigned to the command of the troops for the defense of the city. On 1 November he became commander of the Army of the United States. His short and successful campaign, with that of Gen. Cox up the Kanawha Valley, settled the fate of West Virginia, stimulated the Union men in their effort to form a new government, and finally resulted in the dismemberment of Virginia and the formation of the new State of West Virginia. E. A. CARMAN.

Richard I., king of England: b. Oxford 8 Sept. 1157; d. Chaluz, France, 6 April 1199. He was the 3d son of Henry II. of England and Eleanor of Aquitaine and while an infant was betrothed to Alice, a daughter of Louis VII. of France. Made duke of Aquitaine in boyhood, he took part in the rebellion of his brothers against his father, who at different times attempted to deprive Richard of his possessions, and even planned to exclude him from the succession to the crown in favor of the younger son John. In 1189, in conjunction with Philip Augustus of France, he waged war on his father and compelled Henry II. to acknowledge his right to the throne. Two days after the conclusion of peace Henry II. died at Chinon (6 July 1189). In September, he was crowned king at Westminster and immediately began preparations for a crusade to the Holy Land, in fulfilment of a vow made two years before. To raise money for the expedition he sold fiefs and offices, surrendered to William the Lion of Scotland the suzerainty over that country and increased the burden of taxation. Proceeding through France he joined the army of the French king at Messina where he became involved in a conflict with Tancred, king of Sicily, in the course of which the English king made himself master of Messina. The intrigues of Philip Augustus brought on enmity between the two sovereigns and Richard repudiating his betrothed, Alice, sister of the French king, secured the hand of Berengaria of Navarre, who joined him at Cyprus where they were married. After he had conquered the island and seized its treasures he joined the crusading army before Acre (8 June 1190). Between the English and the French bitter feelings now prevailed and at one time hostilities were threatened. Acre, nevertheless, was taken by the crusaders, and in August Philip sailed for Europe. War with Saladin (q.v.) was renewed on account of Richard's atrocious massacre of 2,700 Mohammedan prisoners. At Arsuf, 7 September, Richard won a decisive victory and in spite of prolonged negotiations moved on Jerusalem, arriving in December 1191 within a very short distance of the city. He fell back to Ascalon where the contest between

Guy of Lusignan and Conrad of Monferrat for the kingdom of Jerusalem was productive of dissensions among the crusaders. A second advance on Jerusalem met with ill success and in August 1192, Richard concluded a three years' truce with Saladin and left the Holy Land, having made no conquest beyond that of Acre. Shipwrecked in the Adriatic, he attempted to make his way disguised through Germany, but was taken prisoner near Vienna by his enemy, the Duke of Austria, who handed him over to the Emperor. Brought before the imperial diet, Richard pledged himself to a ransom of 150,000 marks and received his English kingdom as a fief from the Emperor. The influence of the French king and Richard's own brother was effectual in prolonging the English king's imprisonment. Liberated in March 1194 he landed in England in the same month and was crowned a second time. John was forced to submit and Richard, collecting all the money he could for a war with Philip of France, sailed for Normandy in May. The contest which dragged on for five years presents little that is noteworthy, and in January 1199 peace was made. While besieging the castle of Chaluz, held by a vassal with whom Richard disputed the possession of a newly found treasure, the king was wounded by an arrow and died in his tent. Richard I. owes his fame to the glamor with which legend has surrounded his name as the typical warrior of the Middle Ages. As a king he did nothing for England; his great passion was war, and the only redeeming features in a character of violence and ferocity are a certain naive magnanimity and the splendid courage which gained him even in his lifetime the title of *Cœur de Lion*, "Lion-hearted." The legend which recounts how Richard immured in an Austrian prison was discovered by his favorite minstrel, Blondel, who had wandered throughout Europe singing his songs outside of castle walls, dates from the second half of the 13th century. Richard figures prominently in Scott's *'Ivanhoe'* (1820); and *'The Talisman'* (1825), and in Maurice Hewlett's *'Richard Yea and Nay.'* Consult Stubbs, *'Early Plantagenets'* (5th ed. 1886); Norgate, *History of the Angevin Kings'* (1887); Archer, *'Crusade of Richard I.'* (1889); Round, *'Feudal England'* (1895); Stubbs, *'Constitutional History of England.'* Vol. I. (6th ed. 1897).

Richard II., king of England: b. Bordeaux 6 Jan. 1367; d. Pontefract, Yorkshire, February 1400. He was a younger son of the Black Prince and a grandson of Edward III. and succeeded to the throne on the death of his grandfather in June 1377, at a time when England was suffering from the effects of the black death, the demoralizing results of the war with France and the misgovernment by faction that marked the latter part of the reign of Edward III. The young king was placed under the control of a council in which his uncle, John of Gaunt, Duke of Lancaster, exercised a predominant and, on the whole, pernicious influence. Popular disaffection, fed by the ill success of the government in repelling attacks on the part of the French and the Scots, was intensified by the increasing burden of taxation. The imposition of a new capital tax in 1380 led to the

outbreak of the celebrated Peasants' Revolt in 1381. (See TYLER INSURRECTION.) Richard displayed great presence of mind in dealing with the insurgent forces near London, and to his bearing was largely due the speedy suppression of the revolt, which was directed largely against John of Gaunt. In 1382 he married Anne of Bohemia and about the same time sought to free himself from the control of Parliament by building up a party of his own with Robert de Vere, Earl of Oxford, and Michael de la Pole, Earl of Suffolk, as a nucleus. Richard thereby came into conflict with John of Gaunt who in 1386 departed for France. The leadership of the opposition fell to the unscrupulous Duke of Gloucester, the youngest of the king's uncles. In 1387 Parliament, controlled by Gloucester, demanded the dismissal of the chancellor de la Pole, and of Oxford, who had been made Marquis of Dublin with sovereign rights in Ireland, and though the king refused to yield, he was compelled to accept a committee of 11 appointed by Parliament with extensive power of government for a period of one year. Suffolk was dismissed. When Richard set himself to overthrow the committee, the Duke of Gloucester and the earls of Arundel, Derby, Nottingham and Warwick, took up arms, marched on London, demanded the trial of five of the king's principal advisers on the charge of treason, and brought about their condemnation by Parliament. Forced to submit for a time, Richard succeeded in throwing off his uncle's authority in 1389 and for the ensuing eight years ruled with moderation and in peace. He had not abandoned, however, his views on the absolute authority of kings and had not forgiven the party of Gloucester for their persecution of his former supporters. In 1387 Gloucester, Arundel and Warwick were seized, and a packed and intimidated Parliament condemned the three to death. Arundel was executed, and Warwick imprisoned. Before sentence could be carried out on Gloucester, news of his death came; that death was probably a violent one. The earls of Derby and Nottingham were spared and raised to the dignities of Duke of Hereford and of Norfolk. Extensive powers were surrendered by Parliament to the king and his triumph was complete. A quarrel between Hereford and Norfolk led to their banishment from England in 1388 and on the death of Hereford's father, John of Gaunt, Richard seized the Lancastrian estates. In May he went to Ireland for the settlement of the affairs of that country and Hereford seized the opportunity of invading England, ostensibly for the purpose of recovering his estates. When Richard landed in England in August, he found himself abandoned by his followers and Henry of Lancaster in possession of power. On 19 August he gave himself up to Henry at Flint in Wales. He was brought to London and on 29 September resigned the crown in favor of Henry, who on the following day, took the royal title with the consent of Parliament. Richard was sentenced to strict imprisonment and was removed to Henry's castle of Pontefract. There he died, probably by violence, though his body was publicly exposed to refute the charge. Richard was a patron of Chaucer and Gower and was favorably inclined to the teachings of Wyclif. Consult Wallon, *'Richard II.'* (1864); Stubbs,

'Constitutional History of England,' Vol. II. (4th ed. 1896).

Richard II., a historical play by Shakespeare, produced between 1594 and 1596. It is based on Holinshed's 'Chronicle' and narrates the story of the supplanting, on the throne of England, of the weak-willed Richard II., by the politic Bolingbroke (Henry IV.). It is the earliest in point of time of the historical dramas and in 1720 an adaptation of it was made by Theobald. It is now and then seen upon the stage but much less often than 'Richard III.,' 'King John' or 'Henry IV.'

Richard III., king of England: b. Fothering Castle in Northamptonshire, 2 Oct. 1452; d. Bosworth, Leicestershire, 22 Aug. 1485. He was the youngest son of Richard, Duke of York, and upon the accession of his brother to the throne as Edward IV. he was created Duke of Gloucester and received the grant of extensive lands with the office of admiral. With Edward he fled to Holland in 1470, and with him returned in the following year, commanding the Yorkist vanguard against the Lancastrian forces at Barnet and Tewkesbury, where he distinguished himself by his courage and skill. There, too, he gave signs of his innate ferocity, by his execution of the Lancastrian commander Somerset and others. The murders of Edward, Prince of Wales, after Tewkesbury, and that of Henry VI. in the Tower are also ascribed to him. Richard became grand-chamberlain of England, and, marrying Anne, the younger daughter of Warwick, fell into violent disputes with his brother Clarence who was the husband of an elder daughter. The death of Clarence in 1478, for which Gloucester cannot be made directly responsible, greatly enriched the latter. In 1480 he became lieutenant-general of the north and in 1482 carried on a victorious campaign in Scotland. Edward IV. died in April 1483 leaving Richard as guardian of his 13-year-old son Edward and protector of the kingdom. Richard's first move after securing possession of the king was to seize the queen-mother's relatives, who were soon after sent to execution. Lord Hastings, who at first sided with Richard but showed signs of disaffection at his ambitious schemes, was likewise put out of the way. With the aid of the Duke of Buckingham Richard began openly to work for the crown. Doubts were cast on the legitimacy of Edward IV.'s children and in June a subservient Parliament asked Richard to assume the crown. This he did 26 June, though the coronation did not take place till 6 July. Soon after the young sons of Edward IV. were done to death in prison. Buckingham now began to plot against Richard and in October stirred up an insurrection in Wales and the southern counties, but the movement collapsed and Buckingham was sent to the scaffold (2 Nov. 1483). More than a year of peace followed during which Richard acquired much popularity by his wise legislative measures and energetic administration. Early in August 1485, Henry, Earl of Richmond, Lancastrian claimant for the throne, landed in England, and Richard going to meet him was defeated and slain at Bosworth Field, after a display of heroic valor. The popular conception of him as a dwarf and hunchback rests on no good authority. Undeniably he was a man of fine

powers and bid fair to become one of England's ablest rulers; undeniable, too, however, are his ruthless ferocity and total lack of moral consciousness. Consult: 'Letters and Papers of the Reigns of Richard III. and Henry VI.,' edited by Gairdner (Rolls Series 1861-3); Fabyan, 'The New Chronicles of England and France' (1811); Walpole, 'Historic Doubts on the Life and Reign of Richard III.' (1768); Legge, 'The Unpopular King: Life of Richard III.' (1835); Jesse, 'Memoirs of Richard III.' (1862); English Historical Review, Vol. V. (1891); Gairdner, 'Life and Reign of Richard III.' (1898).

Richard III., a historical drama by Shakespeare, the last of a closely linked group of historical tragedies. It was printed anonymously in 1599, but in the next year it appeared with Shakespeare's name. For nearly two centuries, or from 1700 to 1876, Cibber's alteration of the text was the only version seen upon the stage, but in the last named year Edwin Booth restored the Shakespearian version. By some authorities the play is supposed to have been a completion and alteration by Shakespeare of an earlier play by Marlowe on the same subject. It is still a popular play on the boards.

Richard Plantagenet, plān-tāj'ē-nēt, EARL OF CORNWALL, titular emperor of Germany, younger son of King John of England: b. Winchester, Hampshire, 5 Jan. 1209; d. Kirkham, Lancashire, 2 April 1272. He fought against France, in the army of his brother Henry III., went on a crusade to Palestine, and on his return to England in 1242 again assisted his brother in a war against France, but was soon after deprived of his French domain Guienne. In 1256 he was chosen emperor of Germany by a faction while the opposing party declared Alfonso X. emperor. He was crowned king of the Romans in 1257, but was unable to obtain general recognition though he exercised all the rights of a sovereign. In 1264 he returned to England to assist his brother and was taken prisoner at the battle of Lewes, 13 May 1264. He returned to Germany in 1268, held a diet at Worms in 1269, after which he returned to England. He was one of the ablest and wealthiest princes of his day.

Consult: Lorenz, 'Deutsche im 13. und 14. Jahrhundert' (1863-7); Schirmacher, 'Die letzten Hohenstauffen' (1871); Koch, 'Richard von Cornwall 1209-1257' (1888).

Richard Carvel, a historical novel by Winston Churchill, published in 1900. It is a story of the Revolutionary period and the hero, Richard Carvel, spends his early life in Maryland, where he is brought up by his grandfather, an ardent supporter of King George. The climax of the story is reached in a brilliant description of the victory of the Bon Homme Richard over the Serapis, in which battle Carvel is severely wounded.

Richard of Cirencester, sīs'ē-tēr, English chronicler of the 14th century. All that is known of his life is that he entered the Benedictine monastery of St. Peter's, Westminster, and was there in 1350; that in 1391 he obtained permission from his abbot to make a visit to Jerusalem; and that he died in his monastery in 1400 or 1401. He is the author of 'Speculum Historiale de Gestis Regum Angliæ,' a compilation from other chronicles, giving an account

of the kings of England from 447 to 1066. His name is best known, however, in connection with a forgery of the 18th century. In 1747 Charles Bertram, an English teacher in Copenhagen, wrote to the well known English antiquary, Stukeley, that a friend of his had a manuscript work on Roman Britain, by a monk named Richard of Westminster, and a transcript of the MS. was subsequently forwarded, with a few lines in facsimile. The author was soon identified with Richard of Cirencester, who henceforth passed for the writer of a valuable Latin treatise, 'De Situ Britanniae.' The work was published in Copenhagen in 1757 and passed as authentic until B. B. Woodward, librarian of Windsor Castle, exposed the forgery in 1866.

Richard Roe. See DOE, JOHN.

Richards, rich'ardz, Charles Brinckerhoff, American engineer; b. Brooklyn, N. Y., 23 Dec. 1833. He was educated privately, and for many years was superintendent of the Colt's Arms Company at Hartford. He occupied a similar post with the Southwark Foundry and Machine Company at Philadelphia in 1880-4, was consulting engineer for numerous public buildings and since 1884 has filled the chair of mechanical engineering at Yale. He invented in 1861 the indicator for steam-engines, which bears his name; was one of the United States expert commissioners at the Paris Exposition in 1889, and prepared a large share of their official report; and is a member of various American and European scientific societies. He was editor of engineering and technical terms in Webster's 'International Dictionary.'

Richards, Ellen Henrietta Swallow, American chemist and educator; b. Dunstable, Mass., 3 Dec. 1842. She was graduated from Vassar in 1870, from the Massachusetts Institute of Technology in 1873, and in 1875 was married to Robert Hallowell Richards. She has been an instructor at the Massachusetts Institute of Technology since 1876, is chemist of the Manufacturers' Mutual Fire Insurance Company, and is also a specialist in water analysis. She has published 'Chemistry of Cooking and Cleaning' (1882); 'The Cost of Living' (1899); 'Air, Water, and Food' (1900); etc.

Richards, Henry Brinley, Welsh pianist and composer; b. Carmarthen, Wales, 13 Nov. 1819; d. London 1 May 1885. He was educated at the Royal Academy in London, gained a high position as a pianist and became a director and professor at the Academy. He made a specialty of Welsh music on which he frequently lectured, and won popularity by his compositions which include pianoforte pieces, part songs, songs, orchestral pieces, etc. His works include: 'Overture in F minor, for Orchestra' (1840); 'The Harp of Wales' (1863); 'God Bless the Prince of Wales' (1863); 'Let the Hills Resound' (1873); etc.

Richards, Laura Elizabeth Howe, American writer of juvenile fiction; b. Boston 1850. She is a daughter of Mrs. Julia Ward Howe (q.v.), and was married in 1871 to Henry Richards of Gardiner, Maine, where she has since resided. Among her numerous popular works are: 'The Joyous Story of Toto' (1885); 'Queen Hildegarde' (1889); 'Captain January' (1890); 'Three Margarets' (1897); 'The Green Satin Gown' (1903).

Richards, Thomas Addison, author and artist; b. London 3 Dec. 1820; d. Annapolis 29 June 1900. He came to the United States in 1831 and settled in Georgia. He studied art at the National Academy in New York and with Daniel Huntington, and at an early age began writing and illustrating for publication. He organized the Woman's School of Design at Cooper Union in 1859 and was its first director. In 1868 he became professor of art in the University of the City of New York and after 25 years' service was made professor emeritus. He was a constant exhibitor at the National Academy of Design, became an associate in 1848, an academican in 1851, and was member of the council and corresponding secretary 1852-92. In the early '50s he was a frequent contributor of pictures and text to 'Harper's Magazine,' describing in his articles scenes in the United States and the homes of American authors. His landscape paintings produced in many parts of the United States and Europe are illustrative rather than creative. He was the author and illustrator of 'The American Artist' (1848); 'Georgia Illustrated' (1851); 'Romance of American Landscape'; 'Summer Stories of the South'; 'Pictures and Painters.'

Richards, William Trost, American artist; b. Philadelphia, 14 Nov. 1833; d. Newport, R.I., 8 Nov. 1905. He first studied under Paul Weber and in 1855 went abroad for observation and study in Italy and Paris, establishing a studio in Philadelphia in 1856. In his landscapes he adopted the minute method of drawing characteristic of the English Pre-Raphaelites, though he resembled them in no other respect, his subjects being transcripts rather than composed pieces. His greatest success was in his marines where he carefully studied the motion of waves in storm and calm. He painted numerous subjects along the Atlantic coast, especially near Newport where he later lived. He exhibited at the Royal Academy, London, at the Paris Salon and the various American Expositions. He was a member of the National Academy of Design. A series of his water-color marines hangs in the Metropolitan Museum, New York.

Richardson, rich'ard-sôn, Abby Sage, American lecturer and author; b. Massachusetts 14 Oct. 1837; d. Rome, Italy, 5 Dec. 1900. She was married to Daniel MacFarland, and in 1866 made her début as an actress. In 1868 she was divorced from MacFarland and was engaged to marry Albert Deane Richardson (q.v.) when he was shot by her former husband in 1869. She was married to Richardson a few days before his death and then retired from the stage, afterward devoting herself to lecturing and writing. She made several adaptations of plays from the French and her last work was a dramatization of Weyman's 'Sophia.' Her works include: 'Stories from Old English Poetry' (1871); 'Old Love Letters' (1883); 'Abelard and Heloise' (1884); etc. In collaboration with Grace Furniss she adapted the plays: 'The Pride of Jennico' and 'The Colonial Girl.'

Richardson, Albert Deane, American journalist; b. Franklin, Mass., 6 Oct. 1833; d. New York 2 Dec. 1869. He was a war correspondent for the New York *Tribune* during the Civil War and while trying to run the batteries of

RICHARDSON

Vicksburg in 1863 was taken prisoner and held for 18 months. He was shot by Daniel MacFarland 26 Nov. 1869 and died a few days later. His miscellaneous writings were published by his widow, Abby Sage Richardson (q.v.), with the title 'Garnered Sheaves' (1871), and his other works include: 'The Field, the Dungeon, and the Escape' (1865); 'Beyond the Mississippi' (1866); 'A Personal History of Ulysses S. Grant' (1868); etc.

Richardson, Sir Benjamin Ward, English physician: b. Somerby, Leicestershire, 31 Oct. 1828; d. London 21 Nov. 1896. He was educated at Anderson College, Glasgow, and St. Andrews University, and in 1855 removed to London and for three years was lecturer on medical jurisprudence at the School of Medicine, in Grosvenor Place, and until 1865 lecturer on physiology. Sanitary reform and methods of producing anæsthesia were the two fields in which he was especially interested. Of the 14 anæsthetics that he brought into use methylene bichloride is most widely known. He introduced the ether spray for local anæsthesia, and the lethal chamber for the humane extinction of the life of animals. He also discovered the properties of amyl nitrite and introduced a number of bromides and other substances into use by the medical profession. He was a strong advocate of total abstinence from the use of alcohol, on the ground that its power as a drug required the greatest caution in its use. Aside from his scientific writing he produced biographies, plays and poems. The "Asclepiad," a series of original researches in the science, art and literature of medicine, was written entirely by himself and appeared quarterly from 1884 to 1895. Besides works already mentioned he wrote 'Diseases of Modern Life' (1876); 'National Health' (1890); etc.

Richardson, Charles, English philologist: b. London 5 July 1775; d. Feltham, Middlesex, 6 Oct. 1865. He studied law, but early turned his attention to literary pursuits and afterward opened a school at Clapham. He was pensioned in 1852. His works include: 'Illustrations of English Philology' (1815); 'New Dictionary of the English Language' (1837); 'On the Study of Languages' (1854); etc.

Richardson, Charles Francis, American educator: b. Hallowell, Maine, 29 May 1851. He was graduated from Dartmouth in 1871, was editor of the New York 'Independent' in 1872-8, of the Philadelphia 'Sunday School Times' in 1878-80, and of 'Good Literature', New York, in 1880-2. Since 1882 he has occupied the chair of English at Dartmouth. He has published: 'A Primer of American Literature' (1878); 'The Cross,' poems (1879); 'The Choice of Books' (1881); 'American Literature 1607-1885' (1886-8); 'The End of the Beginning' (1896); etc.

Richardson, Ernest Cushing, American librarian: b. Woburn, Mass., 9 Feb. 1860. He was graduated from Amherst in 1880 and from Hartford Theological Seminary. In 1883-90 he was professor and librarian at the latter institution and since 1890 has been librarian at Princeton. He was American editor of Berner's 'Jahresberichte d. Geschichtswissenschaft'; critical editor of 'Hieronymus v. Gennadius de Viris Illustribus' (1896); and wrote: 'Bio-

graphical Synopsis of the Ante-Nicene Fathers' (1887); 'Classifications, Theoretical and Practical' (1901).

Richardson, Henry Hobson, American architect: b. Parish of St. James, La., 29 Sept. 1838; d. Boston 27 April 1886. He was graduated at Harvard in 1859 and in the following year went to Paris and entered the Ecole des Beaux Arts. Throughout his student life in Paris he worked under the instruction of L. J. André, and when his private fortune was swept away by the Civil War he secured through André's friendship an appointment in a government office in Paris. In 1865 he returned to the United States and located his business in New York. His first commission, received in October 1866, was for building the Church of the Unity in Springfield, Mass. The design of this church is the only instance of his following Gothic models: and this, which may in general terms be typical of the English Rural Gothic, yet presents certain independent features that show the practical bent of his mind. Shortly afterward he built the Boston & Albany railroad office in the same city and Grace Church in West Medford. In October 1867 he formed a partnership with Charles Gambrell which lasted until October 1878. The works of this period, which include several of his more important ones, and especially Trinity Church in Boston, were projected under the firm name, though with few exceptions were the conceptions of Richardson. In 1870 the commission was received to build the Brattle Street Church in Boston and the design he produced, Romanesque in general character, may be regarded, however, as rather transitional to that style that he worked in so consistently in the latter part of his life, and which received its first confirmation in the North Church of Springfield, built by him in 1872. The Brattle Street Church, now known as the First Baptist Church, has a fine tower ornamented below the upper arcade by a bold sculptured frieze. The church itself is ineffective in respect to the relations of its general masses with this superb tower, and, its acoustic properties being imperfect, the work is judged a partial failure.

Trinity Church in Boston was begun in 1872 and finished in 1877. This church shows the perfection of his individual style evolved from his study of the Romanesque churches of southern France. It is cruciform in plan, but its distance from apse-wall to façade is only about 39 feet in excess of the distance between the two walls of the transepts. This innovation in church architecture has had a powerful effect upon subsequent designs. After Trinity he produced only two other, and these comparatively unimportant churches, though he entered the competition for the Cathedral Church at Albany. His subsequent work was in the designing of municipal or commercial structures, and of these the one by which he wished to be judged was the Allegheny County Buildings, Court-house and Jail, of Pittsburg, Pa. These structures, however, he did not live to see completed. Other buildings designed by him are Sever Hall, and the Law School of Harvard University; the City Hall at Albany; parts of the New York State Capitol at Albany, in which he was associated with Leopold Eidlitz and Fred-

erick Law Olmsted, his individual work being the Senate chamber, the Governor's room, the Court of Appeals chamber and the Western staircase; the Chamber of Commerce at Cincinnati and the Field Building at Chicago. Other buildings such as stores, railway stations, public libraries and private dwellings were designed by him. Consult: Van Rensselaer, 'Henry Hobson Richardson, and His Works' (1888).

Richardson, Sir John, Scottish naturalist and Arctic explorer: b. Dumfries, Scotland, 5 Nov. 1787; d. Lancrigg, near Grasmere, Scotland, 5 June 1865. He was educated at the University of Edinburgh and in 1807 entered the navy as assistant surgeon. In 1819 he was appointed surgeon and naturalist to Sir John Franklin's expedition to Hudson Bay and the Coppermine River. He was appointed surgeon of the Royal Marines at Chatham in 1824, but accompanied Franklin on his second Arctic expedition in 1825, resuming his duties at Chatham in 1827. He was knighted in 1846 and in 1848 set out with Rae in search of Franklin. The search was fruitless so far as finding trace of Franklin, but Richardson gained valuable information concerning the physical conditions of North America. In 1855 he resigned his position as surgeon to the Hasler Hospital at Gosport, which he had held since 1838. He was author of the articles "Ichthyology" and "Franklin" for the *Encyclopædia Britannica*; Vols. I. and III. of 'Fauna Boreali-Americana'; and also published: 'A Voyage Through Rupert's Land and the Arctic Sea' (1851); 'The Polar Region' (1861); etc.

Richardson, Leander, American journalist: b. Cincinnati 28 Feb. 1856. He has been engaged on various leading newspapers, was editor of the 'Dramatic News' in 1891-6, on the editorial staff of the *New York Morning Telegraph* 1896-1900, and is now (1906) editor of the 'New York Inquirer.' He has adapted several plays and operettas from the French and has written: 'The Dark City'; 'As Ye Sow'; the plays: 'The Millionaire'; 'Under City Lamps'; etc.

Richardson, Rufus Byam, American archaeologist: b. Westford, Mass., 18 April 1845. He was graduated from Yale in 1869, studied divinity at Yale 1869-72, and at Berlin 1872-74. He was professor of Greek at the University of Indiana 1880-2, and at Dartmouth 1882-93, and since the year last named has been director of the American School of Classical Studies at Athens, Greece. He has edited *Æschines' 'Oration Against Ctesiphon'* (1889); and contributed frequently to the 'American Journal of Archaeology' (1892-1902). He wrote 'Vacation Days in Greece' (1903).

Richardson, Samuel, English novelist: b. Derbyshire, 1689; d. Parson's Green, near London, 4 July 1761. Up to the age of 50 the life of Richardson was not only uneventful, but undistinguished. The son of a joiner of the better class, who had moved from London owing to circumstances vaguely connected with Monmouth's rebellion, there is no clear evidence that he ever had more than what he calls "common school learning." His father's means did not permit him to take orders, but as a

concession to an early taste for reading, he was, when the family returned to the metropolis, apprenticed to John Wilde, an Aldersgate street printer. Here he exhibited the usual traits of the exemplary apprentice; proceeded, in due course, compositor, corrector, overseer, and master; and, as in duty bound, eventually married his employer's daughter. From Fleet street, where he first began business, he moved to Salisbury Court (now square); set up newspapers and books; worked on the publications of the Society for the Encouragement of Learning; and advanced generally in an industrious career. His first wife dying in 1731, he married again, his second wife being the sister of James Leake, a Bath bookseller. Children were borne to him by both his wives; but he was well past middle life before he had acquired any literary reputation, although he had long been known to his friends as what Goldsmith calls "a dab at an index," a clever compiler of opportune prefaces and "honest dedications," and, above all, a copious and indefatigable letter-writer.

This, from his childhood, had been his hobby. As a boy he was the chartered secretary of all the love-sick girls in the neighborhood; as a printer's apprentice he had corresponded voluminously with a gentleman who was a "master of the epistolary style;" and it is characteristic of the qualities he afterward developed as a novelist, that his communications were always of the moral or improving order. Out of these things arose his first literary effort. Two bookseller friends, Rivington and Osborn, suggested to him the preparation of a model letter-writer. Richardson at once went farther by proposing that the letters should teach those concerned to think as well as write. Such was the origin of the little-known volume of 'Familiar Letters' issued in January, 1741. Before it was finished, one of the model epistles, coupled with the recollection of something he had heard some 20 years before, led him to the composition of a story, also in letters, dealing with the triumphs of chastity in humble life. The idea rapidly grew into the famous 'Pamela; or, Virtue Rewarded' (1740), which not only obtained an immediate and unexampled success, but, by superadding to the patient realism of Defoe a power of minute mental analysis which Defoe did not possess, set a new fashion in fiction. It is this latter quality, together with the transfer of the fable from the impossible land of heroic romance to the very probable region of ordinary life, which gives the Salisbury Court printer his claim to have invented the novel of sentimental analysis as opposed to the novel of manners. Despite the moral professions of 'Pamela' many of its scenes are needlessly indelicate; and the final union of the heroine to the man who has repeatedly attempted her ruin is unpleasant,—to say nothing of the fact that there is a sordid air of calculation about the virtue she so vigilantly preserves. But dealing, as the story did, with real people in a real way, in what was, moreover, a dead season of letters, the book's success is not surprising. Fine ladies raved about it in public places. Clergymen praised it from the pulpit. Pope, sincerely or insincerely, declared it "would do more good than many vol-

umes of sermons," and the voices of the continuer and parodist were speedily heard in the land.

Of the inevitable sequel, 'Pamela's Conduct in High Life,' by John Kelly of the 'Universal Spectator,' nothing need be said, save that it forced Richardson upon a continuation of his own, now deservedly neglected. But among the numerous publications prompted by 'Pamela's' more assailable side, two in particular require to be mentioned. One was 'An Apology for the Life of Mrs. Shamela Andrews,' a clever but very gross attack upon the inner morality of the heroine. Richardson himself attributed this to Fielding, as did other of his contemporaries; but Fielding is never known to have acknowledged it. Ten months later Fielding issued 'Joseph Andrews,' which at all events set out with the open intention of burlesquing Richardson, although its writer promptly abandoned this inadequate motive with the development of more important characters than Pamela Booby, a name which, both in 'Shamela' and 'Joseph Andrews,' is cruelly filled in from Richardson's hero, "Mr. B." Either of these performances was sufficient to be a thorn in the side of 'Pamela's' sensitive author. But probably the worst thorn of all was the success of Fielding's 'Tom Jones,' which appeared not long after Richardson's next novel of 'Clarissa.'

'Clarissa; or the History of a Young Lady,' usually misnamed 'Clarissa Harlowe,' was published in 1747-8, in seven volumes and three instalments. The story, which deals with the "Distresses that may attend the Misconduct both of Parents and Children in Relation to Marriage," is an intensely tragic one. The heroine, a very pure and beautiful woman, is deliberately hunted down by a relentless seducer, whose eventual death at the hand of her guardian only faintly satisfies poetical justice. But in this book Richardson rises to the height of his powers. Encumbered by a story to be told in letters, and trammelled with his own prolixity, he nevertheless contrives to hold his readers fascinated, not only with the fortunes of his heroine, but with the individuality of her despicable but dazzling pursuer, who is drawn with surpassing dexterity. The intermittent mode of publication added flame to the public interest in the issue; and the writer was bombarded with appeals for a "happy ending." As to this, he showed more artistic fortitude than might have been expected. Imperfect as his education had been, he had learned from the 'Spectator' that to "make virtue and innocence happy and successful" was to defeat one of the great ends of tragedy, "the raising of commiseration and terror in the minds of the audience." So Clarissa Harlowe dies elaborately of a broken heart; and her history remains a masterpiece.

By this time Richardson was nearing 60, and might reasonably have held his hand. But the welcome accorded to Fielding's 'Tom Jones,' coupled with the importunities of his coterie of lady friends, soon engaged him in a third effort, the object of which was to delineate a model good man and fine gentleman combined. This was the 'History of Sir Charles Grandison' (1753-4), a book which

still has its admirers, though it does not by any means attain the tragic level of 'Clarissa.' That the hero of such a work should be something of a prig is inevitable; but he has many estimable qualities which are not ridiculous; and he is surrounded by a bevy of female worshippers who are drawn with unquestionable skill. Neither Clementina nor Harriet Byron could have been conceived by an inferior artist. It is easy to make fun of the little printer's superexcellent central figure; but there must, in spite of his long-windedness, have been something in the personage who could attract the admiration of both Ruskin and the Master of Balliol.

Beyond a very popular paper in Johnson's 'Rambler,' Richardson wrote nothing more of importance. He continued to prosper in his business, made money, became Master of the Stationers' Company, and eventually Law Printer to the King. He was a nervous, inoffensive, sensitive valetudinarian, delighting in the stimulus of feminine adulation rather than in the robust criticism of his own sex. His style is hopelessly pedestrian and diffuse; but it has an extraordinary cumulative power which attracts, and by degrees detains, the persevering reader. His faculty of minute imagination is wonderful; and he gradually acquired an extraordinary insight into the workings of the female heart. The English fiction which followed developed itself on somewhat different lines; but it is impossible to deny to him the credit of inaugurating the novel of sentimental analysis, which for a time became the fashion, even more in France and Germany than in England.

Bibliography.—Richardson's life has been written by Mrs. A. L. Barbauld, 'Memoir' prefixed to 'Correspondence' (6 vols., 1804); by Miss C. L. Thomson (1900), and by Austin Dobson, 'English Men of Letters' (1902). Consult also Scott's 'Lives of the Novelists' (1825); Mrs. Oliphant, 'Blackwood's Magazine' (March, 1869); H. D. Traill, 'Contemporary Review' (October, 1883), and Texte's 'Jean Jacques Rousseau' etc. (1895). There are editions of his novels by Rev. E. Mangin (1811); Sir Leslie Stephen (1883); Mrs. McKenna (1901), and Prof. W. L. Phelps of Yale. There are several portraits of Richardson by the painter Joseph Highmore.

AUSTIN DOBSON,

Author of 'Life of Richardson,' etc.

Richelieu, Armand Jean du Plessis, *armān zhōn dü plēs-sē rēsh-lē-e*, Eng. *rēsh'loo*, **Cardinal, Duc DE.** French prelate and statesman: b. Paris, according to Jal, who cites a register of baptism, 9, not as usually stated, 5 Sept. 1585; d. Paris 4 Dec. 1642. He was originally destined for the profession of arms but his brother, Alphonse, having resigned the bishopric of Luçon, this was bestowed on him by Henry IV. (1606). He obtained from the pope a dispensation allowing him to accept the office though under age, and on 16 April 1607 was consecrated by the Cardinal de Givry in presence of the pope himself (Paul V.). For several years he devoted himself to the duties of his see, reforming abuses, and laboring for the conversion of Protestants. But his ambition always made him turn his eyes toward the court, and having come to Paris in 1614 as deputy of

the clergy of Poitou to the States-General he managed to insinuate himself into the favor of the queen-mother, who obtained for him the post of grand-almoner, and in 1616 that of secretary of state for war and foreign affairs. On the disgrace of the queen-mother (1617) Richelieu fell with her, and was banished first to Blois and then to Avignon. In 1620 he managed to effect a reconciliation between Mary of Medici and her son Louis XIII. On 5 Sept. 1622 he obtained through her influence the cardinal's hat, and on 19 April 1624 was admitted into the council of state. No sooner was Richelieu secure in his high post than he began systematically to extend the power of the crown by crushing the Huguenots and overthrowing the privileges of the great vassals, and to increase the influence of the French monarchy by undermining that of the Hapsburgs, both beyond the Pyrenees and in Germany. Louis XIII., sensible of the energy of his minister, favored his plans, though he always showed a dislike for the man, whom he would gladly have destroyed had he been able to govern without him. The Huguenots had for a long time resisted the royal power; and bloody insurrections, in several preceding reigns, had arisen from their struggles in their attempts to gain political and religious power. The wisdom and mildness of Henry IV. had, indeed, assuaged the excitement of the contending parties, but his reign was too short to extinguish the fires. Richelieu resolved to crush the weaker by the aid of the stronger party, and thus to deprive those who should be disposed to resist his schemes of their main prop. The rallying-point of the Huguenots was Rochelle; and Richelieu neglected no means to make himself master of that city. In the celebrated siege of Rochelle he commanded the army in person.

Rochelle, supported by England, from which it continually received supplies, held out for a long time against all the efforts of the cardinal; and the hope of reducing it was already nearly abandoned, when Richelieu, by the erection of an immense mole, cut off the communication by sea, and finally compelled it to surrender by famine (1628). It would be a mistake to see in this war that Richelieu waged against the Huguenots an example of religious intolerance, for although this would have been quite in keeping with the spirit of his time, Richelieu was, with respect to this matter, in advance of his age. He destroyed the political consequence of the Huguenots as a separate body within the state, but by the Peace of Alais or Edict of Grace, which concluded the war (June 1629), he left them liberty of worship and equality of civil rights, and throughout his ministry employed them, with other citizens, in the army, the magistracy, and offices connected with the revenue. During the continuance of this war Richelieu had taken various steps in pursuance of the other main end of his internal policy, the overthrow of the power of the great nobles. In 1626 he ordered the demolition of all those feudal fortresses which could not be used for the defense of the frontiers, and which were a perpetual menace to the crown. The next step was the removal from court of the queen-mother who had become hostile, and endeavored to obtain Riche-

lieu's downfall. Saint Simon represented to the king the services of Richelieu and the impossibility of dispensing with his aid. Louis, therefore, ordered him to Versailles, and assigned him apartments in the palace directly below his own. This day (10 Nov. 1630), on which the hopes of the queen and of the cardinal's enemies were disappointed, was called the "Day of the Dupes" (*"la Journée des Dupes"*). The queen-mother was banished to Compiègne, her friends removed from place, and some of them thrown into the Bastille. This step, and the almost total annihilation of the privileges of the parliaments and the clergy, excited all classes against the despotic administration of the cardinal, and the discontent broke out in numerous risings and conspiracies, which, however, were not only suppressed by the prudence and vigor of his measures, but also contributed to the furtherance of his plans, and gradually rendered the royal power entirely absolute. In 1632 the royal arms, directed by Richelieu (in the previous year raised to the rank of duke), suppressed the rising in favor of the Duke of Orleans, the king's brother, to which the Duke of Montmorency had been induced to lend his support. Even those whom the king privately favored were obliged to yield to the all-powerful minister, and paid with their lives for their rashness in venturing to oppose him, as in the instance of Cinq-Mars, who in 1642, had entered into a conspiracy against him, which the king was, not without reason, believed to have favored. While the minister was thus extending the power of the crown at home he did not neglect the aggrandizement of the monarchy abroad. The Thirty Years' war gave him an opportunity of effecting this object. The same man who pursued, with the greatest severity, the Protestants in France, employed all the arts of negotiation, and even force of arms, to protect the same sect in Germany, for the purpose of humbling the house of Austria. In the early stages of the war he subsidized Count Mansfeld. Subsequently Gustavus Adolphus, king of Sweden, the great bulwark of religious liberty in Germany, received aid of every kind from Richelieu as long as he was not in danger of becoming formidable to France; but when the brilliant victories of Gustavus gave the cardinal reason to consider his power as more dangerous than that of Austria he abandoned that prince in the midst of his successes. The war which he undertook against Spain, and which continued till 1659, put France in possession of Catalonia and Roussillon, and the separation of Portugal from Spain was effected by his assistance (1640).

Richelieu must be allowed to have deserved the character of a great statesman; he cannot be denied the glory of having raised the power of the sovereign in France to its highest pitch; but he was proud, arrogant, and vindictive. He was a patron of letters and art, and founder of the French Academy and the Jardin des Plantes. Louis XIII. died a few months after him; but in the long reign of Louis XIV. the effects of Richelieu's policy were yet visible. Richelieu was the putative author of *'Mémoires'* relating to the years 1632-5; *'Maximes d'Etat ou Testament Politique du Cardinal de Richelieu'*; and *'Journal du Cardinal de Richelieu.'* Of these the first two are doubtful, and the last almost

RICHELIEU — RICHMOND

certainly spurious. Consult: Hanotaux, 'Histoire du Cardinal de Richelieu' (1893-6); D'Avenel, 'Richelieu et la Monarchie Absolue' (1884-90); Lodge, 'Richelieu' (1896); Zeller, 'Louis XIII., Marie de' Médicis, Richelieu Ministre' (1899). See also FRANCE, *History*.

Richelieu, Chamblay, shān-blā, or **Sorel**, sō-rēl', a river in Canada, in the Province of Quebec; the outlet of Lake Champlain, and a tributary of the Saint Lawrence River. It is 80 miles long, from one to two miles wide in some places and from 1,000 to 1,200 feet in other parts. It is navigable its whole length, except a short distance where rapids are an obstruction. A canal has been built around the rapids. In the valley of this river, Chamblay Valley, were made some of the first settlements in Canada. The river was of importance in the discovery and settlement periods in America, as it was part of the great waterway into the interior; and for over two centuries, beginning with Champlain's Iroquois campaign in 1609, it was the scene of many battles.

Richepin, Jean, zhōn rēsh-pān, French poet and dramatist: b. Médéah, Algeria, 4 Feb. 1849. He began the study of medicine with his father, a physician, but gave it up and entered the Ecole Normale in the Department of Literature. After 1870 he engaged in journalism, editing 'L'Est,' and contributing to 'Mot d'Ordre,' the 'Corsaire' and 'Vérité,' in which latter he published 'Les Etapes d'un Refractaire.' Shortly afterward he published 'Chanson des Gueux,' for which he was fined and obliged to spend a month in prison, during which time he wrote 'Morts bizarres.' Works of this character have placed him among the most advanced of the naturalistic school; the boldness of his expression and the license of his subject have brought to him both applause and condemnation. In reply to criticism he admitted in 1881, in defense of his works, that his coarseness was perhaps unnecessary and repugnant, but not immoral. His works include verses under titles such as 'Caresses' (1877); 'Blasphèmes' (1884); 'La Mer' (1886); 'Mes Paradis' (1894); of romances 'Madame Andre' (1874); 'Sophie Monnier' (1884); 'Césarine' (1888); 'Braves Gens' (1888), besides many others; and of dramas 'Nana Sahib' (1882); 'Monsieur Scapin' (1886); 'Le Flibustier' (1888); 'Par le Glaive' (1892); 'Vers la Joie' (1894); 'Chemineau' (1897). He published also a work entitled 'Théâtre Chimérique' (1896) in 27 acts in prose and verse.

Richfield, rīch'fēld, Utah, county-seat of Sevier County; on Rio Grande Western railroad; 135 miles south of Salt Lake City. It was incorporated in 1878. It is the centre of an agricultural and stock-raising region. The public school system includes a high school founded in 1896; there is also an association library. Pop. (1890) 1,531; (1900) 1,969.

Richfield Springs, N. Y., village in Otsego County; on the Delaware, Lackawanna & Western railroad; about one mile from Schuylers Lake, 25 miles south by east of Utica, and 13 miles north by west of Cooperstown. It is in a productive agricultural region; but the village is a well-known health resort on account of

its large number of mineral springs. It is also a famous summer resort. Nearby are many places of attraction, as Otsego Lake and vicinity. There are many beautiful drives and excellent roads to all the villages and towns in the vicinity. It has several small manufacturing establishments which more than supply local needs. The place was settled about the middle of the 18th century, but a permanent settlement was not made until after the Revolution. It was one of the favorite localities of the Indian tribes of eastern New York. Pop. (1890) 1,623; (1900) 1,537.

Richford, rīch'fórd, Vt., village in Franklin County; on the Missisquoi River, and on the Central Vermont and Canadian Pacific R.R.'s; 45 miles northeast of Burlington. It was first settled in 1795 and incorporated as a village in 1878. The village is built on both sides of the river which affords good water power; the lumber interests exceed all others in importance, and there are several lumber, saw, and planing mills. It is also in a maple sugar and agricultural region, and has a good trade, being a port of entry from Canada. It contains a high school, founded in 1892. Pop. (1890) 1,162; (1900) 1,513.

Richibucto, rīsh-ē-bŭk'tō, formerly **Liverpool**, Canada, the capital of Kent County, New Brunswick, at the mouth of Richibucto River, 46 miles northeast of Saint John. It is a port of entry and the eastern terminus of a branch line connecting with the Intercolonial Railway at Kent Junction. The river is navigable for 15 miles, and there is a considerable export trade in lumber and fish. Shipbuilding is carried on. Pop. (1901) 3,879.

Richland (rīch'land) **Center**, Wis., city, county-seat of Richland County; on Pine River and on the Chicago, Milwaukee & St. Paul railroad; 55 miles north-northwest of Madison. It was settled in 1849 and was made the county-seat in 1852. It is the centre of an agricultural, stock-raising, and dairying region, and has a large export trade in flour, cheese, etc. The river furnishes water power for manufacturing; and the city contains flour and saw mills, a tannery, and brick kiln. There is a public high school. Pop. (1890) 1,819; (1900) 2,321.

Richman, rīch'man, **Irving Berdine**, American lawyer and diplomat: b. Muscatine, Iowa, 27 Oct. 1857. He was graduated from the State University of Iowa in 1883 and admitted to the bar in 1885. He was elected to the lower house of the State legislature in 1889 and 1891, and was United States consul-general in Switzerland, with residence at Saint Gall, 1893-8. He has published: 'John Brown Among the Quakers and Other Sketches' (1894); 'Appenzell: Pure Democracy and Pastoral Life in Inner Rhoden' (1895); 'Rhode Island: its Making and Meaning,' a historical work of much importance (1902).

Richmond, rīch'mōnd, **Countess of**. See BEAUFORT, MARGARET.

Richmond, Dean, American capitalist: b. Barnard, Vt., 31 March 1804; d. New York 27 Aug. 1866. He engaged successfully in the refining and selling of salt at 15, was a director in a Syracuse bank before he was of age and afterward engaged as a shipping and produce

RICHMOND

merchant at Buffalo. He was a leader in the movement which consolidated seven separate corporations into the New York Central Railroad Company in 1853, was its vice-president in 1853-64 and president in 1864-6. He was a recognized political leader but declined public office.

Richmond, Legh, English clergyman: b. Liverpool 29 Jan. 1772; d. Turvey, Bedfordshire, 8 May 1827. He was graduated from Cambridge in 1794, took orders in the Church of England in 1797, and in 1798 became curate of Brading in the Isle of Wight. In 1805 he was appointed chaplain in the Lock Hospital, London, and later in the same year became rector at Turvey, where he remained until his death. He was well known as a leader in the evangelical party, and wrote several tracts which were widely circulated, among them: 'The Dairyman's Daughter,' of which more than 4,000,000 copies in 19 different languages were circulated; 'The Negro Servant,' etc. He also published: 'The Fathers of the English Church, or a Selection from the Writings of the Reformers and Early Protestant Divines of the Church of England' (8 vols., 1807-11). Consult: 'Life,' by Grimshawe (1826, edited by Bedell 1846).

Richmond, Sir William Blake, English painter: b. London 29 Nov. 1843. He studied in the schools of the Royal Academy, where he received two silver medals in 1857 and had his portrait of his two brothers hung at the exhibition in 1861. He has traveled extensively in Italy, Greece, and Egypt studying the remains of ancient art, whence he has derived many subjects for his work. From 1878 to 1883 he was Stude professor at Oxford. His works include 'The Procession of Bacchus' (1865-8); 'The Life of Women' (1870), a series of frescoes for J. S. Hodgson of Haslemere; 'Electra at the Tomb of Agamemnon' (1877); 'Behold the Bridegroom Cometh' (1881); 'Release of Prometheus' (1882); 'Audience at Athens during the Representation of Agamemnon' (1885), now in the Birmingham Gallery. He has painted portraits of Darwin, Gladstone, Browning, William Morris, Holman Hunt, and Lord Lyttelton. Most notable of his works are the interior decorations and the glass mosaics of St. Paul's Cathedral. This work was executed by a staff trained under his personal supervision. He is an earnest advocate of the development of mosaic work in England, believing that this art should be applied only in the country and under the conditions of light in which the finished product is to remain. In 1895 he became a Royal Academician, and has been professor of painting at the Royal Academy. Consult his article on Mosaics in Vol. XXXI. of the New Volumes of the 'Encyclopædia Britannica.'

Richmond, Australia, a city of Victoria, suburban to Melbourne (q.v.). Pop. 38,000.

Richmond, Canada, the capital of Wolfe and Richmond counties, Quebec, 76 miles east of Montreal, on the Saint Francis River, an affluent of the Saint Lawrence. Its chief institution is Saint Francis College, affiliated to McGill University. The town has railway works, machine shops, and other industrial establishments. Pop. (1901) 2,057.

Richmond, England, an ancient town in the county and 42 miles northwest of York (North Riding), on the left bank of the Swale. In and around the town are numerous interesting remains of antiquity, the most remarkable of which is the castle, comprising an area of nearly six acres, and one of the most majestic ruins in England; its great tower, about 100 feet high, is a fine and very perfect specimen of the Norman keep. Pop. (1901) 3,836.

Richmond, Ind., city, county-seat of Wayne County; on the Whitewater River, and on the Pittsburg, C. C. & St. L., the Grand Rapids & I. R.R.'s; 68 miles east of Indianapolis and 70 miles northwest of Cincinnati. The Richmond Interurban and the Dayton & Western traction lines connect the city with all nearby places. Richmond was settled and platted in 1816 by Friends from North Carolina. It was incorporated in 1834 and chartered as a city in 1840. The city has about 300 manufacturing establishments, employing about 3,500 persons. The chief manufactures are threshers, drills, plows, engines, boilers, carriages, milling machinery, clothing, flour, and dairy products. It is the commercial and industrial centre of a large portion of the county. It has a number of fine public buildings, chief of which are the churches and schools. There are 26 churches, 10 public school buildings, two Roman Catholic parish schools, and one Lutheran parish school. Other educational institutions are Earlham College (Friends), Saint Mary's Academy (R. C.), one business college, and the Morrison-Reeves Free Public Library. The Eastern Indiana Insane Hospital, a State institution, is located here; also other charitable institutions. The three National banks have a combined capital of \$350,000; the annual amount of business is \$2,400,000. The government is vested in a mayor and a council of 14 members elected biennially by the people. The metropolitan police board is appointed by the governor. Pop. (1890) 16,608; (1900) 18,226.

B. F. WISSLER,
Editor 'Sun-Telegram.'

Richmond, Ky., city, county-seat of Madison County; on the Louisville & N. and the Louisville & A. R.R.'s; about 25 miles south-southeast of Lexington and 135 miles east-southeast of Louisville. It is in an agricultural region; in the vicinity is found an excellent building stone. The chief manufactures are tobacco and dairy products, and the trade is chiefly in farm and tobacco products, cattle, and horses. Its educational institutions are Madison Institute, under the auspices of the Church of the Disciples, Walter's Collegiate Institute, a Presbyterian institution, and public elementary schools. One of the most desperate battles of the Civil War was fought at Richmond. The Confederate forces under E. Kirby Smith defeated a much larger Federal force under Manson and Nelson. Pop. (1890) 5,073; (1900) 4,658.

Richmond (Ky.), Battle of, the most decisive Confederate victory of the Civil War. On 14 Aug. 1862 Gen. E. Kirby Smith left Knoxville, Tenn., to unite with Gen. Bragg in northern Kentucky. He passed through Big Creek Gap of the Cumberland Mountains and, leaving Gen. Stevenson's division to observe

RICHMOND

the Union forces at Cumberland Gap, penetrated Kentucky with about 6,000 men. Preceded by Col. J. S. Scott's cavalry force of 900 men, he moved in the direction of Frankfort, threatening both Louisville and Cincinnati. Gen. Lew Wallace, with a regiment, hastened from Louisville to Lexington, and there found other forces, over which he was placed in command; new regiments came from north of the Ohio; but as Wallace was about to move forward and oppose Smith he was superseded by Gen. Nelson, who had been ordered by Gen. Buell to take charge of affairs in Kentucky. Upon his arrival Nelson organized the troops at Lexington into a division of three brigades, under Gens. M. D. Manson, Charles Cruft, and J. S. Jackson; and hearing that the Confederates were approaching, he sent forward some Kentucky cavalry to oppose them. There were several sharp cavalry affairs, in which the Union cavalry showed such aggression that Kirby Smith determined to make an immediate attack upon the Union forces at Richmond, although his troops were jaded by long and laborious marches, and Gen. Heth's division of 4,000 men was still far to the rear. He had for the attack Cleburne's and Churchill's divisions of 6,000 men and Scott's cavalry brigade of about 850, and the advance was ordered for the morning of 30 August. Scott's cavalry encountered Manson's brigade about half a mile south of Rogersville, and Cleburne, coming up with two brigades, attacked Manson, who, reinforced by a regiment of Cruft's brigade and a battery, endeavored to turn Cleburne's right, but was repulsed. Meanwhile Churchill's division had come to Cleburne's support; a brigade flanked Manson's right and drove it back in disorder; and as the rout became general, another of Cruft's regiments came up, but was quickly repulsed with heavy loss. Another position was taken farther to the rear, where the troops were under partial cover, with artillery on the flanks. This the Confederates soon attacked; Churchill's division struck Cruft's brigade, which was on the right, and drove it back in disorder; and Cleburne advancing in front, Manson's entire line went back, the Confederates in close pursuit. Manson had but partially formed another line in front of Richmond, when Gen. Nelson came on the field and selected a new line near the town and cemetery; and the troops, barely 2,200 in number, had scarcely taken position when the Confederates were upon them in flank and front, fired about three volleys, and the Union troops gave way in utter rout. Early in the day Scott's cavalry had gained the road in rear of Richmond, and the knowledge of the fact increased the demoralization. Nelson, wounded, narrowly escaped to Lexington and thence to Louisville. Manson was wounded and taken prisoner, with over 4,000 of his men, while nine guns, over 6,000 muskets, and the entire wagon-train were lost. The fragments of the army made their way to Louisville. The Union troops engaged numbered 6,500 raw men; the Confederates about 6,800 veteran troops. The Union loss was 206 killed, 844 wounded, and 4,303 captured or missing, an aggregate of 5,353. The Confederate loss was 78 killed, 372 wounded, and one missing, an aggregate of 461. Gen. Heth, with his division of 4,000 men, joined Smith after the battle, and marched to Lexington,

where he arrived 2 September, and the legislature, then in session at Frankfort, fled to Louisville. Heth marched northward to Cynthiana, and to within a few miles of Covington, to threaten Cincinnati, which he found too well defended to attack, and being in turn threatened, he withdrew to join Smith, who waited at Lexington to join forces with Gen. Bragg, then operating against Gen. Buell. (See *PERKYVILLE, BATTLE OF*.) Consult: 'Official Records,' Vol. XVI.; Van Horne, 'History of the Army of the Cumberland,' Vol. I.; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III. E. A. CARMAN.

Richmond, Maine, town in Sagadahoc County, on the Kennebec River and on the Maine Central railroad, 37 miles north-northeast of Portland. It was first settled in 1700; in 1719-20 a fort was erected here for the defense of the settlers against the Indians; this fort twice resisted attack, and was finally dismantled in 1754. The town was incorporated in 1823. The chief industries of the town include a cotton mill and shoe factory, ice cutting, and agriculture; there are also saw and planing mills and some trade in lumber. The town has a public high school, with which the Richmond Academy (incorporated 1861) was united, and also a public library. Pop. (1890) 1,394; (1900) 2,097.

Richmond, Mo., city, county-seat of Ray County; on the Atchison, Topeka & Santa Fé railroad; 58 miles southeast of St. Joseph. The county-seat was removed to Richmond from Bluffton in 1827. It is the centre of a fertile agricultural and stock-raising region; and there are coal mines in the vicinity which yield excellent quality of bituminous coal. It also has wagon and plow factories, flour mills, and a foundry. It contains the county court-house, and has electric lights and modern waterworks. It is well provided with educational facilities, having two public high schools, of which one, the Lincoln high, is for colored pupils; and is also the seat of Woodson Institute, a coeducational secondary school under the auspices of the Methodist Episcopal Church, South. Pop. (1890) 2,895; (1900) 3,478.

Richmond, Va., city, port of entry, capital of the State; county-seat of Henrico County; on the James River, the Richmond-Washington Line, the Atlantic Coast Line, the Chesapeake & Ohio, the Seaboard Air Line, and the Southern R.R.'s; about 115 miles almost due south of Washington, D. C., and 90 miles from the mouth of the river at Chesapeake Bay. Area 4.85 square miles, but including the suburbs, 16 square miles. The surface is hilly, rising from the river and the valley of Shockoe Creek in a series of hills, almost terrace-like in formation, until it reaches altitudes of from 170 to 250 feet above sea-level, at which altitudes there are plateaus constituting the principal residential sections. It was originally built on seven hills, and was often called the "Modern Rome." In 1842, when Charles Dickens visited the city, it had extended its limits to another hill, and he wrote of it as "delightfully situated on eight hills overhanging James River."

Regular lines of steamers, the Virginia Navigation Company and Old Dominion, connect

RICHMOND.

2. Capitol Square, showing the new City Hall Building.

RICHMOND

the city with Atlantic and Chesapeake ports, and furnish a cheap outlet for shipping products to other parts of the United States and to foreign ports. James River (q.v.) furnishes water power which is used extensively for manufacturing and of the total horse-power 14,000 utilized, 10,000 horse-power being electrically developed, it propels the entire street car system and supplies the electric lights of the city. Several bridges (four railroad and two for vehicles, street cars and foot passengers) cross the river and connect the city with Manchester, and beyond its suburbs with Forest Hill Park, Bonair, Granite, Spring Hill, and other places. A seventh is being constructed especially for the street cars.

There are about 120 miles of streets, 40 miles of which are sewerred, and about 30 paved. The streets are all fairly wide. Main, the chief thoroughfare, is a broad, well-built street; Broad is the widest street in the city; Grace and West Franklin, as well as some of the suburbs, are residential sections. The water supply, which when clear is most excellent for domestic and all other purposes, is obtained from the James River at two points above the city. The water is pumped into two reservoirs from which it is piped for distribution throughout the city, and an extensive settling basin and system for insuring its clarification at all times is being pushed to completion. The natural drainage makes the city healthful, and warm winters and temperate summers attract many home seekers who desire a mild climate.

Industries.—The chief industries of the city are connected with the preparation of tobacco for local use and for shipment to outside markets. The Federal census of 1900 gives 49 establishments for the manufacturing of tobacco; the amount of capital invested, \$3,054,450, and the value of the products for the year mentioned, \$10,537,803. There were 5,666 employees, to whom were paid \$1,506,090 wages for the same year. The establishments were 17 smoking and chewing tobacco factories, 22 cigarette and chee-root factories, and 10 stemmeries and packing houses. The foundries and machine shops number 18 establishments, with invested capital, \$5,164,103; and the annual value of products \$2,594,186. There were six establishments engaged in preparing fertilizers for market. The invested capital was \$2,163,731, and the value of the products, \$1,045,003. Other manufacturing establishments were wagon and carriage works, lumber mills, railroad car factory, confectionery factory, and baking powder works. In 1900 the city contained 763 manufacturing establishments which represented 100 different industries. The capital invested in manufacturing concerns was \$20,848,620; there were 17,885 persons employed, and the annual wages amounted to \$6,447,929. The amount paid for raw material the same year was \$13,161,697; and the total product for the year was valued at \$28,900,616.

Commerce.—The location and the facilities for transportation make Richmond the commercial centre of a large extent of southeastern Virginia, and an important point of distribution for the Carolinas and adjoining Southern States. For the year ending 30 Dec. 1902, the custom house records showed the amount of imports as \$115,204; but these figures are entirely misleading as a measure of its foreign trade, as

its imports and exports are principally cleared through the custom-houses of New York and other northern ports. The amount of trade with the United States Atlantic coast cities and the cities and towns of the interior of the State is very large.

Banking and Finances.—The city has 32 banking institutions, including 5 national, 5 state banks, 6 savings banks, 3 trust companies, 13 private bankers and brokers, one loan and deposit company. The combined capital of the national and state institutions is \$3,771,062.50; the surplus, \$3,190,478.48; the deposits, \$21,491,616.34; loans and discounts, \$19,251,540.43; and total resources, \$31,491,616.34. The assessed valuations of the city in 1903 were, real, \$4,560,516; personal, \$37,003,705; total, \$81,624,221. The receipts for the current year (1904) are estimated at \$1,871,076.04; and the expenditures, \$1,861,888.96. The chief items of expense in the budget for 1904 are, to the sinking fund for interest and redemption, \$473,311.26; a special appropriation of \$20,000 for opening and widening streets and one of \$50,000 for a new gas holder in west end are also in this budget; for schools, \$179,743.74; police department, \$113,100; fire department, \$116,150; waterworks, \$78,385; gas works, \$191,500; streets, \$183,010. The bonded debt is (1904) \$6,686,647.60. The municipal assets, including waterworks, gas plant, city-hall, parks, market-houses, school buildings, etc., were valued at \$8,000,000; and there was to the credit of the sinking fund in bonds and cash, \$838,246.23.

Public Buildings, Parks, and Monuments.—Richmond is historic ground and her noted public buildings are valued more on account of their association than for the architectural merits which they possess. Capitol Square, on Shockoe Hill, has an area of 12 acres. It takes its name from the State Capitol which is on the square. The Capitol was built after a model procured by Thomas Jefferson when he was in France, and which was patterned after Maison Quarries of Nismes, an ancient Roman temple, only changing the columns from the Corinthian to the Ionic. The corner-stone was laid in 1785, and on 19 Oct. 1789, the eighth anniversary of the surrender of Lord Cornwallis at Yorktown, the Virginia State Legislature convened in the new Capitol. The model for the Capitol sent from France by Jefferson is still in the building. In the rotunda is the most valuable piece of marble in America, Houdon's statue of Washington, modeled from life. The General Assembly of Virginia (1903-1904) appropriated \$250,000 for the purpose of adding wings to the east and west sides of this building, for steps to the imposing portico at the southern end, and for some interior improvements. These additions will be in harmony with the architectural style of the original building, will preserve its most characteristic features and furnish additional room, much needed by the General Assembly and the various State departments.

On the same square is the library building, which contains the parole signed by Lord Cornwallis at Yorktown, the original Virginia Bill of Rights, and the Virginia ordinance of secession. The executive mansion is on this square, on land which was once a part of Nathaniel Bacon's plantation. The old building known as the Bell House has many interesting associations.

RICHMOND

The old bell, purchased in 1790, was for years a "voice to the people."

Among the famous pieces of statuary on the grounds is the equestrian statue of Washington, by Thomas Crawford (q.v.). Of the statues at the base Crawford completed only Thomas Jefferson and Patrick Henry; the other pieces, George Mason, John Marshall, Thomas Nelson, and Andrew Lewis, were made by Randolph Rogers. Nearby stands a fine marble statue of Henry Clay, by Joel T. Hart; also several other marble statues and a bronze statue of "Stonewall" Jackson, by Foley. Three fountains add to the beauty of the square. The largest park of the city has an area of 300 acres. It has a lake, a fine boulevard, and the chief reservoir. Monroe Park has many fine trees and some good pieces of statuary. Libby Park is on Libby Hill. It is terraced from Main Street to the summit, and a monument in honor of the Confederate soldiers and sailors stands on the highest point. Chimborazo Hill Park has an area of 36 acres. A Government road leads from the park to the National Cemetery where are buried 6,547 Federal soldiers who fell in the attempts to capture the city during the Civil War. Jefferson Park is between Pleasant and Marshall streets; Gamble's Hill Park is on a relic of the James River and Kanawha Canal, still used as a race to a number of important water-power plants. It also overlooks the famous Tredegar works where cannon were made, and the no less famous Belle Isle, the site of the Old Dominion Iron and Nail Works, where a number of Federal prisoners were confined during the war between the States. Lee Circle, in the western part of the city, has a bronze equestrian statue of Robert E. Lee (q.v.), by Mercie, a French sculptor. It represents the General on "Traveller," his well-known war-horse. In Howitzer Park is a monument in memory of the Richmond Howitzer battalion. A favorite drive is the one to Hollywood, where sleep 12,000 Confederate soldiers. A monument of granite, pyramidal in form, 90 feet high and softened by a covering of Virginia creeper and ivy, has been erected to the memory of the Confederate dead soldiers. Many of Virginia's famous men are buried here. Tyler and Monroe, Presidents of the United States; John R. Thompson, the poet; Matthew F. Maury, "Pathfinder of the Seas"; John Randolph; Jefferson Davis, president of the Confederacy, and a number of Confederate Generals. The most noted parks and squares have a combined area of 358 acres; but the little squares and circles, not mentioned as noted, ornament the city, and give it an artistic air.

Other historic and prominent landmarks are the residence occupied by General Lee and his family, now the home of the Virginia Historical Society; the house occupied by Jefferson Davis while he was president of the Confederate States; and the famous Monumental Church on Broad Street, formerly called Academy Square. At one time a large wooden building, built for an Academy of Fine Arts, occupied the present site of the church. In 1788 the old building saw a brilliant gathering of "history makers," who met to discuss the document proposed as the Constitution of the United States of America. Madison, Mason, Marshall, Pendleton, Randolph, Lee, Wythe, and others were

there, and finally the Constitution as framed at Philadelphia was ratified by Virginia. Only 23 years afterward occurred in the same building at a theatre the terrible disaster which resulted in the death of 72 persons, among whom was the Governor of the State. The present church is their monument; the portico extends over their tombs and the charred remains. The house once the home of Chief Justice Marshall stands on the street named in his honor. Saint John's Episcopal Church, built in 1740, is in an excellent state of preservation and is still used for religious services. Richard Randolph, who superintended the building of the church, was a descendant of Pocahontas. In the quaint old churchyard surrounding it is the grave of George Wythe, one of the signers of the Declaration of Independence. In this church, on 20 March 1775, was held the famous Virginia Convention which met to hear a report of the first Continental Congress, and to discuss the political situation of the country. The convention feared to hold a session in Williamsburg, the capital, on account of the hostility of Lord Dunmore. The church was the only place in Richmond large enough to contain the convention. It was at this convention that Patrick Henry made his famous speech, ending with the words: "Is life so dear, or peace so sweet, as to be purchased at the price of chains and slavery? Forbid it, Almighty God! I know not what course others may take, but as for me, give me liberty or give me death." The place where the patriotic orator stood is pointed out to strangers. Another remarkable event occurred on 6 Jan. 1781, when Benedict Arnold, at the head of a British force of 900, entered the city, and a number of the soldiers were quartered in this old church. The oldest house in Richmond, a stone building on Main Street, was built in 1737 by Jacob Ege. It is now used as a historical museum. The Valentine Museum contains over 100,000 archaeological specimens, also many fine pictures and statues. This valuable museum was given to the city by Mann S. Valentine. His brother, Edward V. Valentine, the sculptor, has given to the museum several valuable pieces of statuary.

The most costly and the most ornate building in the city of Richmond is the City-Hall, completed about 10 years ago, at an outlay of over \$1,400,000. It is built of Richmond granite, dressed and quarry-faced, is completely fire-proof, commodious in all its appointments and should fully meet all of the requirements of the city for the next hundred years or more.

Education.—The city has an excellent school system; there are public and parish elementary schools for white and similar ones for colored pupils, a high school, normal school for whites and one for colored, Virginia Mechanics' Institute, which has evening classes, kindergartens, and a number of private schools. The secondary schools and colleges are the Richmond Female Institute (Baptist), founded in 1854; Richmond Female Seminary (P. E.); Hartshorn Memorial College for Colored Girls (Baptist), opened in 1883; Visitation Academy (R. C.), founded in 1860; Saint Peter's Academy (R. C.); Saint Joseph's Academy (R. C.); Saint Patrick's Academy (R. C.); Sacred Heart Academy (R. C.); Saint Mary's Benedictine Institute (R. C.); Training School for Kindergartners; Art School

of Art Club, and Saint Andrew's School, the Medical College of Virginia (1837); University College of Medicine (1893); Richmond Theological Seminary (Baptist), opened in 1867; Richmond College (Baptist), opened in 1832; and beyond the city limits, Hartshorn and two others. There are five public libraries with an aggregate of 60,000 volumes.

Churches.—The city has 130 religious organizations and 90 church edifices; 65 for white people and the others for colored. The different denominations rank according to church edifices and organizations as follows: Baptists, Protestant Episcopalians, Methodists, Presbyterians, Roman Catholics, Lutherans, Jews, Christians, Friends. The Roman Catholic Cathedral, being built with means supplied through the munificence of Mrs. Thomas F. Ryan of New York, will be the finest church edifice in the city.

Charitable Institutions.—There are here Saint Sophia's Home for the Aged; the Sheltering Arms; the Home for Incurables; Foundling Asylum; Retreat for the Sick; City Orphan Asylum; Lee Camp Soldiers' Home; and Saint Joseph's Orphan Asylum. There are a number of public and church aid societies and various charitable organizations.

Hospitals.—Saint Luke's Hospital is one of the best equipped institutions in the city.

History.—In May 1607, John Smith, Captain Newport, and others ascended the James River as far as the place where Richmond now stands. In September, 1609, Smith, who was the president at Jamestown, again ascended the river to find a better location for the colony than Jamestown. He purchased from the Indians some land near the present site of Richmond, and so pleased was he with the place that he called it "None Such."

"Forte Charles" was built below the falls, in 1645. In 1675 and in 1687 a further grant of 950 acres, which tracts included the land upon which Richmond now stands; but the city was not founded until some years later by his son, Colonel William Evelyn Byrd. This founder of Richmond seems to have been versed in methods of founding cities which are now called modern. He established two cities "on paper," one at Sohocco's, to be called Richmond, and at the "Point of Appamattuck River," to be called Petersburg. He engaged Major Mayo to lay out the squares, streets, etc. Then he proceeded to advertise his cities, inserting a notice in the Virginia 'Gazette,' April 1737, "that on the north side of James River, near the uppermost landing and a little below the falls, is lately built by Major Mayo a town called Richmond, with streets 60 feet wide, in a pleasant and healthy situation, and well supplied with springs of good water." Byrd was a learned man as well as a good advertiser. He brought to the New World a large and well selected library, a catalogue of which is in the Franklin Library in Philadelphia. He proceeded to build a mill, a warehouse, and such other buildings as were necessary. In its early days the place was called Byrd's Warehouse. In 1742 the Assembly of Virginia established the town, and the wide streets and squares were at last laid out. In 1779 the capital of the commonwealth was removed from Williamsburg to Richmond. Then the place was only a number of disconnected houses in small groups, with rough ground and

rocks intervening. Benedict Arnold entered the city in 1781 and burned a portion of it, as has been mentioned above.

In 1782 Richmond was incorporated as a city, and in 1785 the foundation of the Capitol was begun. This Capitol, from its opening in 1789 down to the present, has been the scene of many stirring historical events. In 1798-9 took place the famous debates which ended in the adoption of the resolutions, drafted by James Madison, regarding the interpretation of the Federal compact. What powerful conventions were held here when such men as Monroe, Madison, John Randolph, and Marshall were members. The convention of 1851 extended the privilege of suffrage, and here in 1861 the Act of Secession was adopted; and in June of the same year, Richmond was made the capital of the Confederate States. In July 1862, the Congress of the Confederacy convened here, and remained in session until April 1865. During the Civil War the city was the great objective point of the chief operations of the Union Army in the East. Again and again the Union forces marched to the battle cry "On to Richmond," and again and again were they repulsed. For three years, from May 1862 to April 1865, the city was almost in a state of siege; the records tell of 15 pitched battles and 25 skirmishes and sharp engagements which were fought in efforts to capture the city. When its defenders yielded, and left the city, they set fire to the arsenals and large tobacco warehouses, and burned the bridges directly after crossing them, which caused a most extensive conflagration in the principal business sections of the city. On 27 April 1870, at a contest over the majority before the Supreme Court of Appeals, over 60 persons were killed by the giving away of the floor of the court room. A large number of people were in the building.

The suburbs of Richmond contribute to the charms of the city and to its history pages. The lines of earth work defenses and the marks of shot and shell are still visible. The broad, shady avenues of stately, beautiful trees lead out to battle grounds now covered with the houses and business establishments of busy, peaceful people.

Pop. (1890) 81,388; (1900) 85,050. But these figures to no extent mark the growth and prosperity of Richmond. With the exception of the annexation of Lee District, which is just beginning to be built up, the corporate limits have not been extended since 1867, and in many quarters the suburbs are quite thickly settled, and are undistinguishable from the adjacent districts of the city.

The rural free delivery of the Richmond post-office serves a suburban population of from 25,000 to 30,000, most of which will be added to the city population by a much needed expansion of the city limits, now under consideration, thus placing it, where it legitimately belongs, in the ranks of cities considerably beyond the 100,000 limit.

Consult: Chesterman, 'Guide to Richmond'; Powell, 'Historic Towns of the Southern States'; Poindexter, 'Richmond'; Scott, 'Capital of Virginia.'

WILLIAM G. STANARD,
Secretary of the Virginia Historical Society,
Richmond, Va.

Richmond (Va.), Kilpatrick's Expedition to. In February 1864 a cavalry expedition organized to make a dash on Richmond, distribute President Lincoln's amnesty proclamation, and liberate the Union prisoners in the city and on Belle Isle. The expedition was put under command of Gen. Kilpatrick, who, with 4,000 men and a battery of artillery, marched from Stevensburg, crossed the Rapidan at Ely's Ford, early on the night of 28 February, and moved swiftly to Spottsylvania Court House. Here Col. Ulric Dahlgren, with 500 men, was detached from the column, on the morning of the 29th to cross James River and enter Richmond from the south. Kilpatrick continued his course to the Virginia Central Railroad at Beaver Dam Station, thence to Ground Squirrel Bridge over the South Anna, and to a point five miles from Richmond, which was reached on the morning of 1 March. Believing that his approach was unknown, and that a small force of infantry only occupied the intrenchments, he moved on the Brook road toward the interior line of defensive works, driving in a few pickets, and found infantry and artillery in the works—500 men and six guns. He opened with artillery, and was about to attack, when he thought he saw reinforcements of infantry filing into the Confederate works, and, feeling certain that Dahlgren had failed, and that his own attack would be a bloody failure, he withdrew to Atlee Station, north of the Chickahominy, and went into camp. Here he was attacked during the night by Wade Hampton's and Bradley T. Johnson's cavalry, the latter having followed him from Beaver Dam Station. The camp of one of his brigades was captured, and Kilpatrick, retreating, was followed down the Peninsula, being joined near Tunstall's Station next day by nearly 300 of Dahlgren's men. He reached Williamsburg on the night of the 2d.

Col. Dahlgren moved from Spottsylvania Court House across the Virginia Central Railroad, near Frederickshall, to James River, near Goodland Court House, where he expected to cross the river, release the prisoners on Belle Isle, and enter Richmond from the south, to unite with Kilpatrick at 10 A.M. of 1 March. But he could find no ford, so marched by the north bank of the river, approaching Richmond late in the afternoon, and coming upon cavalry and infantry, with which he skirmished sharply until night. Hearing nothing from Kilpatrick, except his guns, heard early in the afternoon, and rightly believing that he had failed, Dahlgren withdrew, designating Capt. Mitchell, 2d New York Cavalry, to command the rear guard. In the darkness the column became broken, Dahlgren, with less than 100 men going in one direction, and Mitchell in another. Mitchell succeeded in joining Kilpatrick at Tunstall's with about 260 men. Dahlgren crossed the Pamunkey at Hanover Town, and the Mattaponi at Aylett's Ford, and about midnight 2 March fell into an ambushade and was killed. Others were killed and wounded, nearly all were captured. Capt. Mitchell reports that of the 500 men of Dahlgren's command 61 were killed and wounded, and 138 captured. The total loss of Kilpatrick's command, including Dahlgren's, was about 350. Consult: 'Official Records,' Vol. XXXIII.; Humphrey's 'From Gettysburg to the Rapidan'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Richmond (Va.), Sheridan's Raid on the Communications with, a movement which included the battle of Yellow Tavern. At day-break 9 May 1864 Gen. Sheridan, with 10,000 cavalry and six batteries, started from near Todd's Tavern to cut the railroads entering Richmond from the north and northwest. He moved on the Telegraph road; Merritt's division crossed the North Anna at Anderson's Ford at dark and encamped; the rest of the column, harassed by a brigade of Stuart's cavalry, halted for the night on the north side of the river. The march was resumed early on the 10th, several miles of the Virginia Central Railroad destroyed, with rolling-stock and supplies, and at night Sheridan crossed the South Anna, halting at daylight of the 11th on the south bank. Early in the day Davies' brigade encountered Munford's cavalry at Ashland, on the Fredericksburg Railroad, drove it from the place, destroyed the depot and several miles of railroad, and joined Sheridan's main body at Allen's Station. Meanwhile Gen. Fitzhugh Lee's cavalry division had been rapidly marching by a circuitous route to interpose between Sheridan and Richmond, and had reached Yellow Tavern, on the Brook road, six miles from Richmond. Lee had barely 4,500 men. Sheridan's whole force advanced, Merritt's division leading, followed by Wilson's and Gregg's. Merritt attacked and gained the Brook road at Yellow Tavern, but Gen. Stuart, in command of the Confederates, seized a position on his flank and enfiladed his line with artillery. Then Custer's brigade, supported by Wilson's division, charged the flanking force, breaking it and capturing two guns. In this encounter Stuart was mortally wounded. Stuart's detached brigade, under Gen. James B. Gordon, fell upon Sheridan's rear, but Gregg drove it back toward Ashland. Fitzhugh Lee's division retreated toward Richmond. The losses on both sides were severe. Sheridan followed Lee's division and entered the most advanced line of works covering Richmond. Sheridan had intended to keep south of the Chickahominy and march by way of Fair Oaks, to make a demonstration on Richmond. Marching during the night, at daylight of the 12th he massed his force at Meadow Bridge, overlooking the line of the Virginia Central Railroad and the Mechanicsville pike. After demonstrating on the Confederate works, which were found too strong to be attacked, he determined to recross the Chickahominy at Meadow Bridge. The bridge, which had been partially destroyed, was held by some of Gordon's cavalry and a battery on the north side. Merritt's division crossed after a severe engagement, in which Gen. James B. Gordon, commanding the Confederate cavalry, was killed. Meanwhile, Wilson's division could not pass the second line of the Richmond defenses, on the Mechanicsville road, and was attacked by Barton's and Gracie's infantry brigades and some dismounted cavalry, who, advancing from the works, attacked both Wilson and Gregg, at first with success, driving Wilson in some disorder. After a severe contest the Confederates were driven back to their works, and between 3 and 4 P.M. Wilson and Gregg crossed the Chickahominy above Mechanicsville bridge, and Sheridan encamped his corps near Gaines' Mill. Next day he crossed to the south side of the Chickahominy by Bottom's bridge, marched through White Oak Swamp and, on the

14th, encamped in the vicinity of Haxall's Landing, on James River. He made several demonstrations on the New Market road, in the direction of Richmond, and having drawn supplies from Gen. Butler's army, started on the 17th to rejoin the Army of the Potomac, marching by way of White House, on the Pamunkey. Detachments were sent to destroy the railroad bridges over the South Anna and to demonstrate on Richmond, and 24 May Sheridan rejoined Grant's army near Chesterfield bridge on the North Anna. The Union loss in the movement from 9 May was 64 killed, 337 wounded, and 224 missing. There are no reports of Confederate losses. Consult: 'Official Records,' Vol. XXXVI.; Humphreys, 'The Virginia Campaign of 1864-5'; Sheridan, 'Personal Memoirs,' Vol. II.; McClellan, 'Life and Campaigns of Gen. Stuart'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Richmond (Va.), Union Campaigns Against. As the capital and political centre of the Southern Confederacy, defended by its best army, Richmond became and continued to be the objective point of the Union armies. The first campaign against it was that of Gen. McDowell, which ended in Union defeat at Bull Run, 21 July 1861. (See BULL RUN, FIRST BATTLE OF.) The next campaign had its base at Fort Monroe, from which, 4 April 1862, Gen. McClellan advanced with the Army of the Potomac up the York Peninsula. After the siege and capture of Yorktown and the battle of Williamsburg (q.v.), McClellan crossed the Chickahominy, and 30 May his outposts were within five miles of Richmond. Meanwhile, after the destruction, by her commander, of the Confederate ram Merrimac, Capt. John Rodgers, with three Union gunboats, ascended James River until he reached Fort Darling (q.v.), on Drewry's Bluff, eight miles below Richmond, where, 15 May, he was stopped by the fire of heavy guns. Com. Goldsborough, commanding the navy in those waters, now proposed to McClellan to co-operate with him in a joint naval and land attack on Fort Darling, but McClellan declined, preferring to wait until after he should have crossed the Chickahominy. The Confederate authorities were so much impressed with the gravity of the situation, when they heard that the fleet was ascending the river, that the government archives were shipped to Columbia, S. C., and the public funds were kept on cars ready for transportation.

The Confederate defense at Fort Darling was looked upon as the salvation of the Confederate capital. Strong works were now constructed by the Confederates on Drewry's Bluff and on the opposite side of the river, and to the end of the war they barred advance on Richmond by water. Elaborate works were constructed to defend the city from the land side. On 31 May Gen. J. E. Johnston, commanding the Confederate army, advanced from his works around Richmond and attacked McClellan. The battle continued two days, at the end of which the relative positions of the two armies were unchanged. (See FAIR OAKS, BATTLE OF.) On 25 June McClellan, in view of a general advance, threw forward a part of his force toward Richmond, gaining some ground, but Gen. R. E. Lee, commanding the Army of Northern Vir-

ginia, assumed the offensive on the 26th by crossing the Chickahominy and attacking McClellan's right, forcing McClellan to retreat to Harrison's Landing, on James River, after a series of hard-fought, bloody battles. (See PENINSULA CAMPAIGN OF 1862; SEVEN DAYS' BATTLES.) Richmond now had some respite. Lee invaded Maryland, and upon his return defended Richmond on the line of the Rappahannock, from which Burnside, in December 1862, and Hooker, in April 1863, unsuccessfully endeavored to force him. Lee again assumed the offensive and marched northward for an invasion of Maryland and Pennsylvania, leaving but a small force at Richmond, and Hooker, 10 June, proposed to march immediately upon the city, capture it, and then send the disposable part of his force to any threatened point north of the Potomac, but the proposition was negated by Gen. Halleck, and Hooker was informed by President Lincoln that Lee's army, and not Richmond, was his true objective. On 14 June Halleck ordered Gen. Dix, commanding at Fort Monroe, to send an expedition to threaten Richmond, and destroy the railroad bridges over the South and North Anna rivers. Dix drew troops from Suffolk and Norfolk, and on the 24th Col. Spear, with about 1,200 men of the 11th Pennsylvania, 2d Massachusetts and 12th Illinois cavalry, was sent by water up York River, landed at White House on the 25th, marched through Hanover Court House, and on the 26th attacked and captured about 100 men of the 44th North Carolina at the bridge of the Virginia Central Railroad over the South Anna, burned the bridge, and returned to White House on the morning of the 27th. Upon Spear's return Dix organized an expedition of 10,000 men, under Gen. Getty, to destroy the bridge of the Fredericksburg and Richmond Railroad over the South Anna, and an expedition of 6,000 men and 14 guns, under Gen. Keyes, to threaten Richmond by seizing Bottom's bridge over the Chickahominy. Both expeditions moved from White House on 1 July. Keyes failed to accomplish anything, being held in check by a small force under Gen. D. H. Hill. Getty, preceded by Spear's cavalry, marched from White House to Hanover Court House, which he occupied on the 4th, his advance reaching the bridge over the South Anna late in the day and making an attack, which was repulsed by Gen. John R. Cooke, who had about 4,000 men. Gen. Foster, who was in command of Getty's advance, destroyed some of the railroad track, and during the night was recalled to Hanover Court House. The depot and track at Ashland Station were destroyed, and on the 5th Getty took up the return march to White House, which was reached on the 7th, his loss being 16 killed, wounded, and missing. Dix returned to Fort Monroe and sent part of his command to the Army of the Potomac.

After the Gettysburg campaign (see GETTYSBURG, CAMPAIGN AND BATTLE OF), Gen. Lee fell back beyond the upper Rappahannock, and Gen. Meade followed. Meade was forced back to Centreville, and, renewing the offensive, pushed Lee beyond the Rappahannock and then beyond the Rapidan. Meade now essayed an advance on Richmond by passing Lee's right, but was checked at Mine Run (q.v.), 28-9 Nov. 1863.

On the morning of 6 Feb. 1864 Gen. I. I. Wistar, with 2,200 cavalry and 4,000 infantry, left Williamsburg to make a dash on Richmond and release the Union prisoners there. The cavalry advance arrived at Bottom's bridge, on the Chickahominy, about 13 miles from Richmond, before daylight of the 7th, and found the Confederates in force under Gen. Eppa Hunton, and reinforcements coming up by railroad from Richmond. A deserter from the Union army had given information of the proposed movement, troops had been sent from Richmond, Bottom's bridge taken up, and the fords obstructed. The cavalry charged one of the fords and was repulsed by canister fire with some loss, and Wistar desisted from further effort and returned to Williamsburg. To cover this movement and divert Lee's attention from it, the cavalry and two corps of the Army of the Potomac made a demonstration on the 6th upon Lee's army at Morton's Ford, the demonstration continuing on the 7th, with considerable loss. Later in the month Gen. Kilpatrick made a movement on Richmond which resulted in a lamentable failure. (See RICHMOND, KILPATRICK'S EXPEDITION TO.)

The next and final campaign against Richmond was conducted by Gen. Grant, beginning in May 1864. With the Army of the Potomac he advanced from the north, while Gen. Butler, with the Army of the James, crossed to the south side of James River and marched up its right bank. Butler was defeated at Drewry's Bluff (q.v.), 16 May, and confined to his intrenchments at Bermuda Hundred (q.v.). The Army of the Potomac began the campaign by the battle of the Wilderness (q.v.), 5-7 May, and on the 9th Gen. Sheridan set out on his raid, elsewhere described. (See RICHMOND, SHERIDAN'S RAID ON, and the BATTLE OF YELLOW TAVERN.) Grant continued his campaign in a series of sanguinary battles, and after the bloody repulse of Cold Harbor (q.v.) he abandoned the campaign north of the James, crossed to the south side of the river, 14-16 June, and invested Petersburg and Richmond from that side. (See PETERSBURG, MILITARY OPERATIONS AGAINST.) The siege began on 19 June 1864, and continued until 2 April 1865, when Petersburg was assaulted and taken, and that night Richmond was evacuated, the Union troops under Gen. Weitzel occupying it 3 April.

E. A. CARMAN.

Richmond, Borough of. See NEW YORK CITY.

Richmond College, located at Richmond, Va. It was founded in 1832 by the Baptists under the name of the Virginia Baptist Seminary; the name was changed to Richmond College in 1840. The college was closed during the Civil War; the buildings were used as a hospital by the Confederates, and as barracks by the Federals after their occupation of Richmond. The equipment was largely destroyed and much of the endowment rendered worthless, but the college was reopened in 1866, a new endowment was obtained, and it has since then had a prosperous career and has taken a leading part in Southern educational life. The work of the collegiate department is divided into nine schools, as follows: (1) Latin language and literature; (2) Greek language and literature;

(3) French and German; (4) English language and literature; (5) mathematics; (6) physics; (7) chemistry; (8) philosophy; (9) history. Courses are elected in accordance with the group system, there being three groups; the degree of A.B. and B.S. are conferred; and A.M. for graduate work. There is also a School of Law, which confers the degree of B.L. Women were admitted to the college in 1898. The campus contains 13 acres; the ground and buildings in 1904 were valued at \$600,000; the library contained 15,000 volumes, and the annual income in 1903-4 amounted to \$99,850. The students numbered 224, and the faculty 16.

Richter, rīh'tēr, Adrian Ludwig, German painter and designer: b. Dresden 28 Sept. 1803; d. there 19 June 1884. His father, Carl August Richter, the well-known copperplate engraver, was his first teacher, as he was his father's collaborateur in the production of landscapes in black and white. In 1820 he accompanied Prince Narischkin in a journey through France as draughtsman to illustrate that nobleman's travels; subsequently he spent three years, ending 1826, in Italy. He next applied himself to study the masters of the North Holland School, and chose J. Schnorr as his especial model and standard of excellence. Returning to Germany he was appointed in 1828 to a position in the School of Design at Meissen, which he held for 10 years, meanwhile acquiring a popular reputation as illustrator of 'The Vicar of Wakefield' and 'Popular Books of Germany.' He inaugurated an epoch in German illustrative art by his sympathetic interpretation of common life in Germany, his tender humor and refined fancy. While he drew on wood for book illustration, he also executed numerous etchings, mostly of Italian landscapes. The most important of his landscapes in oil, which, however, are marred by a certain coldness of treatment, are: 'Storm on Mount Gerone' (1830, in the Museum, Frankfurt-on-Main); 'Harvest Time on the Roman Campagna' (1833, Leipsic Museum); 'Schreckenstein near Aussig'; 'Landscape in the Riesen Mountains'; etc. After working for some years as professor of landscape painting in the Dresden Academy, he retired in 1876 on a pension provided by the German emperor. Consult: his autobiography, 'Lebenserinnerung eines deutschen Malers' (1855); Hoff, 'Adrian Ludwig Richter, Maler und Radierer' (1877).

Richter, Gustav, German painter: b. Berlin 31 Aug. 1823; d. there 3 April 1884. He studied under Eduard Holbein in Berlin and Cogniet at Paris, also studied at Rome. He was professor of the Berlin Academy and honorary member of the academies of Munich and Vienna. His first work to attract attention was the 'Raising of Jairus' Daughter' (1856). In 1864 he received the Grand Medal at Berlin; other medals have been conferred on him at Paris, Brussels, Vienna, and Philadelphia. His works are reproduced in vivid colored chromos. He painted many European celebrities, and of Americans a notable portrait of George Bancroft, the historian.

Richter, Henry Joseph, American Roman Catholic bishop: b. Neunkirchen, Oldenburg, Germany, 9 April 1838. He came to the United States in 1854, studied at Saint Xavier's College, New York, at Mount Saint Mary's Sem-

inary, Cincinnati, and in 1860 entered the American College at Rome, where he was graduated in 1865. He was ordained in that year, was vice-president and professor of dogma, philosophy, and literature at Mount Saint Mary's Seminary in 1865-70, and in 1870-83 was rector at Saint Lawrence and chaplain of Mount Saint Vincent Academy. In 1883 he was consecrated first bishop of Grand Rapids.

Richter, Jean Paul Friedrich, generally known as **JEAN PAUL**, German author: b. Wandsiedel, near Baireuth, Bavaria, 21 March 1763; d. Baireuth 14 Nov. 1825. He was educated at Leipsic, and became a tutor and schoolmaster. In 1794 he turned from this to a general literary activity. The prince-primate Dalberg gave him in 1809 an annual pension of 1,000 florins, continued by the king of Bavaria. The fantastic quality of his genius was at first disconcerting, but gradually, says Carlyle, he became considered "not a strange crack-brained mixture of enthusiast and buffoon, but a man of infinite humor, sensibility, force, and penetration." His style is perhaps one of the most barbarous of mediums, and his books are quite without structure. His humor, however, is genuine, though frequently clumsy. He affected boldly to despise all literary proportion and technique, and is recompensed by having the bulk of his work pronounced difficult or unreadable. Yet scattered through his writings are the best of aphorisms and some of the most finely imagined passages in German literature. These may serve to account for the interest Carlyle and De Quincy took in him. Outside of Germany he has not been greatly read, though there are various English renderings of his volumes, such as 'Walt and Vult' by Lee (1846); 'Titan' by Brooks (1863); 'Flower, Fruit, and Thorn Pieces' by Ewing (1877); and 'Levana' by Wood (1887). His first novel, 'Die unsichtbare Loge' ('The Invisible Lodge') appeared in 1793. It was followed by 'Hesperus' (1794); 'Biographische Belustigungen unter der Gehirnschale einer Riesin' ('Biographical Recreations under the Skull of a Giantess,' 1796); 'Leben des Quintus Fixlein' (1796); 'Blumen, Frucht und Dornenstücke' ('Flower, Fruit, and Thorn Pieces,' 1796); 'Der Jubelseniör' ('Parson in Jubilee,' 1797); 'Das Kampaner Thal' (1797); 'Titan' (1800); 'Flegeljahre' (translated by Carlyle, 'Wild Oats,' 1804). The two last are regarded as among his best productions. 'Das heimliche Klaglied der jetzigen Männer' appeared in 1801; 'Dr. Katzenberger's Badereise' (1809); 'Des Feldpredigers Schmelzle Reise nach Flätz' (1809); 'Leben Fibels' (1812); 'Der Komet, oder Nicolaus Markgraf' (1820-2); 'Die Vorschule der Aesthetik,' his first important philosophical work, appeared in 1804, followed by 'Levana, oder Erziehungslehre' (1807), a work on education. Further titles are: 'Friedenspredigt' (1808); 'Dämmerungen für Deutschland' (1809); 'Mars und Phöbus' Thronwechsel im Jahr 1814' (1814); 'Politische Fastenpredigten' (1817). A collection of his works, 'Sämtliche Werke,' edited by him before his death, was published in 65 volumes (1826-38). 'Der Papierdrache,' his last work, was published in 1845. Consult Spazier, 'Jean Paul Friedrich Richter, ein biographisches Commentar zu dessen Werken' (1833); Carlyle's two essays on Richter; Förster, 'Derkwürdigkeiten

aus dem Leben Richters' (1863); and Nerrlich, 'Jean Paul und seine Zeitgenossen' (1889).

Richthofen, rīht'hōf-ən. **Ferdinand**, **BARON VON**, German geologist: b. Carlsruhe 5 May 1833; d. Berlin 7 Oct. 1905. He was educated at the universities of Breslau and Berlin; and went to Austria in 1856 to study the geology of Tyrol, Siebenbürgen and northern Hungary. In 1860 he joined a Prussian expedition to the East and spent 12 years in China, Japan, Siam, Java, the Philippine Islands, Formosa, California, and Nevada. Returning to Europe in 1872 he accepted professorships at Bonn, Leipsic, and Berlin, successively. He published 'China, Ergebnisse eigner Reisen und darauf gegründeter Studien' (1877-83), and the following which have appeared in English: 'The Comstock Lode' (1865); 'Principles of the Natural System of Volcanic Rocks' (1867); 'Letters to the Shanghai Chamber of Commerce' (1869-72).

Rich'wood, Ohio, village in Union County; on the Erie railroad; 34 miles northwest of Columbus. It was settled in 1832, and its growth during the first 30 years was slow; since 1870 it has become the second town of the county in size and importance. It is the centre of an agricultural region; contains flour and planing mills, tile mills, and several large grain elevators, and has a considerable trade. It has a public high school with a school library. Pop. (1890) 1,415; (1900) 1,640.

Ricimer, ris'i-mēr, Roman general of the 5th century A.D.; d. 472. He was a barbarian, and received his training under Aëtius. For a long time he was "kingmaker" in the West. He deposed Avitus, and elevated successively Flavius Anitus (454-6), Majorianus (457-61), Libius Severus (461). After Libius' death, he himself ruled for a time as Patricius, until in 467 the danger of a Vandal invasion compelled an alliance of East and West, and the elevation of Procopius Anthemius. Ricimer later grew openly hostile to the monarch, whom he murdered 11 July 472 during a sack of Rome. He then made Olybrius emperor, and died soon afterward.

Rickards, rik'ardz, **Marcus Samuel Cam**, English poet and naturalist: b. Exeter 28 April 1840. He was educated at Oxford, admitted a solicitor in 1862, and practised for many years in Bristol. In 1876 he took priest's orders in the English Church, was curate of Holy Trinity at Clifton, near Bristol, till 1889, and since that date has been vicar of Twigworth, Gloucestershire. Among his many published works, mainly in verse, are: 'Creation's Hope' (1890); 'Poems of Life and Death' (1895); 'Poems of a Naturalist' (1896); 'Musings and Melodies' (1902).

Rickets, a disease of children in which there is an affection of the general nutrition of the whole body, dependent chiefly upon improper feeding and want of fresh air and exercise. The disease commonly appears after the age of nine months and before that of two years, producing its most obvious effects on the growth of the bones. It is characterized by enlargement of the head, prominent forehead, projecting breast-bone, flattened ribs, big belly, and emaciated limbs, with great debility. The bones and spine of the back are variously distorted. Nature fre-

quently restores the general health, and leaves the limbs in a state of distortion. In the treatment of rickets tonic medicines, the cold bath, etc., are beneficial. The child should be kept clean and dry, regularly exercised, and allowed to enjoy a pure bracing air, that of the seaside being specially beneficial. The food should be nutritious and easily digestible.

Ricketson, rik'ët-sôn, **Walton**, American sculptor: b. New Bedford, Mass., 27 May 1839. He took up sculpture in 1870, and has since produced portrait busts of Bronson Alcott, Louisa M. Alcott, Thoreau, and George William Curtis, besides intaglios and bas-reliefs.

Ricketts, rik'ëts, **James Brewerton**, American military officer: b. New York 21 June 1817; d. Washington, D. C., 22 Sept. 1887. He was graduated from West Point in 1839, served in the Mexican War, where he was engaged at Monterey and at Buena Vista, was promoted captain in 1853, and fought in the Seminole War in Florida. He afterward served on the Texas frontier until the outbreak of the Civil War, when he assisted in the defense of Washington and the capture of Alexandria. He participated in the first battle of Bull Run, and was brevetted lieutenant-colonel and brigadier-general of volunteers. He commanded a division at Chantilly, South Mountain, and Antietam, in 1863 he received promotion as major of artillery in the regular army, was in command of a division in the Richmond campaign, and fought in the engagements from the battles of the Wilderness to the investment of Petersburg. In 1864 he served under Sheridan in the pursuit of Early's army. He was brevetted major-general in the regular army in 1865, and in 1865-6 was in command of a district in Virginia. He was mustered out of the volunteer service in 1866, and in 1867 retired from active duty.

Rickman, rik'man, **Thomas**, English architect: b. Maidenhead, Berkshire, 1776; d. March 1841. He developed a taste for architectural drawing, and having sent in a design for a church that proved successful in a government competition, he settled at Birmingham as an architect. He built a number of Gothic churches and chapels in Birmingham; Hampton, Lucy, Bristol, Preston, Carlisle, etc., many country houses, and the new buildings of St. John's College, Cambridge. He is the author of 'Attempt to Discriminate the Styles of Architecture in England from the Conquest to the Reformation' (1817).

Rico, rê-kô, Colo., town, county-seat of Dolores County; on the Rio Grande Southern railroad; 140 miles southwest of Leadville. The first settlement was made in 1867 and a new settlement in 1877, both by mining prospectors; the town was incorporated in 1879, and became the county-seat on the organization of the county in 1881. It is in a region rich in gold, silver, copper, and iron, and the chief industry is the mining and milling of these ores. The town contains a bank with a capital of \$50,000; and the county court-house. It has a graded public school. The government is vested in a mayor, elected annually, and a council of six members, three elected each year. Pop. (1890) 1,134; (1900) 811.

GEORGE H. HUTT,
Editor 'Rico News.'

Ricord, rê-kôr, **Philippe**, French physician: b. Baltimore, Md., 10 Dec. 1800; d. Paris, France, 22 Oct. 1889. He went to Paris in 1820, where he was granted his medical degree in 1826, practised in the provinces for two years, and on his return to Paris passed the Concours examination, and was appointed a surgeon at the Pitié Hospital. In 1831 his lectures in surgery secured his appointment as surgeon-in-chief at Hôpital des Veneriens du Midi, an office he continued to fill until 1860, when he resigned and engaged in private practice. In 1862 he was appointed physician in ordinary to Prince Napoleon, and in 1869 consulting surgeon to Napoleon III. He was made commander of the Legion of Honor in 1860, and for his services in the ambulance corps during the siege of Paris was made grand-officer of the Legion in 1871. He was the author of various valuable surgical treatises, and invented several surgical instruments.

Riddell, rid-dêl' or rid'l, **Charlotte Eliza Lawson Cowan**, English novelist: b. 30 Sept. 1832. She was the daughter of a high sheriff of Carrickfergus, Ireland, and was married to J. H. Riddell of Staffordshire in 1857. Her earliest novel was 'The Ruling Passion' (1858); and among her many later fictions are 'George Geith,' one of her best known works (1865); 'Maxwell Drewitt' (1865); 'Far Above Rubies' (1868); 'The Senior Partner' (1881); 'The Head of the Firm' (1892); 'A Rich Man's Daughter' (1897). Her stories are well constructed, wholesome tales, and have been popular in this country as well as in England.

Riddell, Mrs. J. H. See RIDDELL, CHARLOTTE ELIZA LAWSON COWAN.

Riddle, rid'l, **Matthew Brown**, American theologian: b. Pittsburg, Pa., 17 Oct. 1836. He was graduated from Jefferson College, Pa., in 1852, and from the New Brunswick Theological Seminary in 1859. He was adjunct professor of Greek at Jefferson College in 1857-8, was pastor of the Dutch Reformed Church, Hoboken, N. J., 1861-5, and of the Second Reformed Church, Newark, N. J., 1865-9. In 1871-87 he occupied the chair of New Testament exegesis at Hartford Theological Seminary, Conn., and since 1887 has filled that chair at the Western Theological Seminary, Allegheny, Pa. He was a member of the American Committee for New Testament revision, an editor of the Standard edition of the Revised Version, and was a revising editor on the Standard American Revised Version of the New Testament (1901). He was one of the editors of Lange's 'Commentary'; 'International Commentary'; 'International Revision Commentary'; and Myer's 'Commentary'; edited Robinson's 'Greek Harmony of the Gospels' (1885); Vols. VII., VIII., 'Ante-Nicene Fathers' and Vols. VI., X., 'Nicene and Post-Nicene Fathers' (1886).

Riddle, any sentence or composition with a double or veiled meaning, which is propounded with a view to the discovery of that meaning, which is designedly obscured by the terms of the riddle. A riddle may either have an apparent sense which serves as a disguise to the real one, or it may be in the form of a question, the terms of which do not directly indicate the na-

ture of the answer required. Riddles naturally divide themselves into two classes: plays upon words, which are otherwise called conundrums; and allegorical or fanciful descriptions of or allusions to the subject on which the riddle is founded. The latter is called an enigma. It is the more ancient and serious form of the riddle. Enigmas, or dark sayings, were frequently used by the ancients to disguise important truths, which it was not deemed safe or advisable that every one should know. Kings sent enigmas to each other, ambassadors delivered their messages in this form, and the oracles of the gods were frequently conveyed in the form of an enigma. In modern times serious enigmas have been elaborated in prose and verse, particularly the latter, in all civilized languages. They are in general mere elaborate trifling, and are commonly as dull as they deserve to be.

Among the most celebrated examples of ancient riddles is that propounded by the Sphinx, and answered by Œdipus, What animal is that which goes on four feet in the morning, on two at midday, and on three in the evening? The answer is Man, because he goes on all fours as a child, on two feet as a young man, and with a staff in old age. The punning variety of riddle, though sometimes indulged in by the Greeks and Romans, is comparatively of modern growth. It is a great favorite in festive gatherings of juveniles. Sometimes strings of puns are linked together with considerable ingenuity in the more complex riddles of this description, as in the following instance: What wind does a hungry sailor like best? One that blows fowl and chops, and then comes in little puffs. The earliest collection of riddles known to have been published is entitled 'Demands Joyous,' printed in 1511. The first French collection was published in Paris by Gille Beys in 1582. See also ENIGMA.

Rideau (rê-dô') **Canal**, a Canadian canal constructed between Kingston on Lake Ontario and Ottawa as a through waterway by means of the River Ottawa to Montreal, the Saint Lawrence route being interrupted by rapids. Canals have since been built along the Saint Lawrence to avoid these, and the Rideau is now little used.

Rideing, rid'ing, **William Henry**, American editor: b. Liverpool, England, 17 Feb. 1853. He came to the United States and lived in Chicago until 1870, after which he was engaged in journalism in various American cities. Since 1881 he has been associate editor of the 'Youth's Companion,' and in 1887-99 was associate editor of the 'North American Review.' He has published: 'Scenery of Pacific Railways' (1878); 'Thackeray's London' (1885); 'In the Land of Lorna Doone' (1895); 'At Hawarden with Mr. Gladstone' (1896); 'How Tyson Came Home' (1904); etc.

Riders, in national or state legislation, the additional provisions of a bill under the consideration of a legislative assembly, having little connection with the subject-matter of the bill. Sometimes riders are attached to important bills, in order to gain the chance of passage, since by themselves they are likely to incur an executive veto, but as a part or proviso of an important bill they are absorbed in the main subject, and so dodge the "veto" and the "table." It has been proposed frequently that the Constitution of the United States be so amended that the

President could veto single objectionable items without affecting the main purpose of bills.

Ridge, ridj, **Major**, Cherokee chief: b. Highwassee, present State of Georgia, about 1771; d. Cherokee reservation 22 June 1839. He became a councillor and one of the leaders of the Cherokee nation. He favored the deportation of the Cherokees from the Georgia reservation to one westward of the Mississippi, and was murdered, presumably, by some of the opposing party.

Ridge, William Pett, English novelist: b. Chartham, Kent. He was educated at the Birbeck Institute in London. He began to write in 1890, and among his published works are: 'The Second Opportunity of Mr. Staplehurst' (1896); 'A Son of the State' (1889); 'A Breaker of Laws' (1900); 'Outside the Radius' (1900); 'Lost Property' (1902).

Ridgefield, ridj'fîld, Conn., town in Fairfield County; on the New York, New Haven & Hartford railroad; about 60 miles northwest of New York, and 13 miles north by west of Norwalk. It is in an agricultural region, and is a favorite resort for residents of New York. The chief industries which contribute to the prosperity of the town are farming, dairying, the grinding of feldspar, and the manufacturing of ice-cutting tools. The most prominent public building is the public library, presented to the town by James Morris of New York, in memory of his wife, Elizabeth W. Morris. There are four churches, good public schools, and one private school. The National Bank has \$25,000 capital; the savings bank has \$592,268.52 deposits. The government is administered by a board consisting of a warden and burgesses, six members, elected annually in May. Pop. (1890) 2,235; (1900) 2,626.

W. A. WHITE,
Editor 'Ridgefield Press.'

Ridge'town, Canada, town in the County of Elgin, Province of Ontario; on the Michigan Central railroad; about eight miles from Lake Erie and 65 miles east of Windsor. It is in an agricultural region, and has some manufacturing interests. Pop. (1901) 2,410.

Ridgeville, ridj'vîl, Ind., town in Randolph County; on the Mississinewa River, and on the Pittsburg, C. & St. L. and the Grand Rapids & Indiana R.R.'s.; about 60 miles south of Fort Wayne, and 90 miles northeast of Indianapolis. It is in a fertile agricultural region, and is the trade centre for the northern part of the county. It has several industries connected chiefly with farm products and stock raising. It has good public schools, several private schools, and a public library. Pop. (1890) 922; (1900) 1,098.

Ridge'wood, N. J., village in Bergen County; on the Erie railroad; about 22 miles north of New York. The railroad divides the village into eastern and western sections. The village is in a residential locality; the western side is built up with fine residences, most of them the homes of men doing business in the city. The eastern section of the village spreads out into the Paramus Valley, through which flows the Saddle River. In this part are substantial dwellings with extensive grounds. There are no manufactures. The business blocks and fraternal society buildings are mostly of limestone and pressed brick.

There are nine churches, public schools, and one private school for boys. Located here is the House of Divine Providence for Incurable Patients, in charge of Sisters of Charity. The water supply is obtained from artesian wells. The roads in the vicinity are excellent, and the scenery in general, together with the numerous groves and small streams, make it a most charming locality. In the vicinity are many points of historic interest, their histories dating back to pre-Revolutionary days. Pop. (1890) 1,047; (1900) 2,685.

Ridgway, rĭd'wā, Robert, American naturalist: b. Mount Carmel, Ill., 2 July 1850. He was zoologist to the United States geological exploration of the fortieth parallel under Clarence King in 1867-9, and since 1880 has been curator of the division of birds in the National Museum at Washington. He was one of the founders in 1883 of the American Ornithologists' Union, of which he later became president. He served as a member of the committee at the first International Ornithological Congress at Vienna in 1885, and of that at Budapest in 1891. He is author of: 'A Nomenclature of Colors for Naturalists' (1886); 'Manual of North American Birds' (1887); 'Birds of North and Middle America' (1901-2); etc.

Ridgway, Pa., borough, capital of Elk County; on the Clarion River, and on the Buffalo, R. & P. and the Pennsylvania R.R.'s; about 150 miles northeast of Pittsburgh and 115 miles southeast of Erie. It is in a region devoted mainly to lumbering and agriculture. The chief industrial establishments are lumber mills, sash, door, and blind factories, flour and grist mills, machine shops, engine and boiler works, and dry kilns. There are other manufactories whose products are mining materials, proprietary medicines, and tobacco products. The educational institutions are public and parish elementary schools, a public library, and a private business school. Pop. (1890) 1,903; (1900) 3,515.

Riding and Driving. See HORSES, RIDING AND DRIVING.

Ridley, rĭd'li, Nicholas, English ecclesiastic and martyr: b. about 1500; d. Oxford 16 Oct. 1555. He was graduated from Cambridge in 1521-2, later studied at the Sorbonne, Paris, and at the University of Louvain. Returning to Cambridge as proctor to the university, as such he advocated the claims of King Henry VIII. to the supreme ecclesiastical jurisdiction in the realm. Through the patronage of Archbishop Cranmer he became one of the king's chaplains; in 1540 he became master of Pembroke Hall, in 1541 canon of Canterbury, and in 1545 an additional canonry of Westminster was conferred upon him. In 1547 he was elevated to the see of Rochester. In 1550, on the deprivation of Bonner, Ridley was made bishop of London, and distinguished himself by his tempered zeal in favor of Protestantism, and especially by his liberality and kindness toward the family of his predecessor. In 1553 in a sermon before Edward VI. he made an appeal for the destitute London poor, and as a result of subsequent conferences the king and corporation of London determined to build Christ's Hospital, St. Thomas' Hospital, and Bethlehem Hospital. On the death of Edward he was induced to listen to those who

attempted to secure the Protestant ascendancy by placing the Lady Jane Grey upon the throne. The defeat of this scheme, the active part he had taken in the establishment in the new discipline and the construction of the liturgy, together with his connection with Cranmer, marked Ridley out as one of the most prominent opponents of Queen Mary. He was arrested and sent to the Tower 20 July 1553. In the spring of 1554 he was removed to Oxford, and being brought before the royal commissioners and refusing to recant he was excommunicated. His further trial progressed slowly. The next year parliament passed penal laws against heretics and under these he was summoned to trial. His condemnation followed upon his admitting the truth of the principal charges against him, and he was burnt at the stake in company with Hugh Latimer.

Rid'path, John Clark, American educator and historian: b. Putnam County, Indiana, 26 April 1840; d. New York 1 Aug. 1900. He was graduated from Asbury University, Indiana, in 1863, and in 1864 was appointed principal of the academy at Thornton, Ind. In 1866 he was superintendent of public instruction for Lawrenceburg, Ind., and in 1867-9 professor of languages at Baker University, Baldwin City, Kan. In 1869 he was appointed to the chair of English at Asbury, and in 1879 became vice-president of the university. The endowment of \$2,000,000 bestowed upon the university by Mr. De Pauw, was secured largely through Ridpath's efforts, and under his management it received its new name of De Pauw. After his resignation from the university he devoted himself to literature. He was one of the editors of the 'People's Cyclopædia' (1881), and published 'Academic History of the United States' (1874-5); 'Popular History of the United States' (1877); 'Life of James A. Garfield' (1882); 'Cyclopædia of Universal History' (1880-4); 'Great Races of Mankind' (1893); 'Life and Times of Gladstone' (1898); 'History of the United States' (1900); etc.

Riedesel, rê'dě-zěl, Frederica Charlotte Louisa (Von Massow): b. Brandenburg 1746; d. Berlin 29 March 1808. She was the wife of Baron Riedesel (q.v.), and accompanied her husband to America. After Burgoyne's surrender she resided for a year at Cambridge, Mass., where a street has since been named in her honor; and later at Charlottesville, Va. She wrote graphic descriptions of the campaign and subsequent events, published after her death by her son-in-law, Count von Reuss, and translated inadequately into English in 1827 ('Letters and Memoirs Relating to the War of American Independence, and the Capture of the British Troops at Saratoga'), and worthily by W. L. Stone in 1867 ('Letters and Journals Relating to the War of the American Revolution').

Riedesel, Friedrich Adolph, FREIHERR ZU EISENBACH, German soldier: b. Lauterbach, Rhine Hesse, 3 June 1738; d. Brunswick 6 Jan. 1800. He studied at the Marburg law school, but before the completion of his course enlisted in a regiment of Hessian infantry as vice-ensign, and soon afterward went to England with his regiment, which had been made part of the British army, and was billeted on a town near London. There he became fairly pro-

RIEL—RIEL'S REBELLION

ficient in English. On the outbreak of the Seven Years' war in 1756, the regiment was summoned to Germany, and Riedesel was assigned to the immediate staff of Duke Ferdinand of Brunswick. Shortly after the outbreak of the American Revolution, England negotiated with several of the petty sovereigns of Germany for some 20,000 troops. Of these about 4,000 were from Brunswick. Riedesel was promoted major-general and placed in command of the Brunswick contingent, and on 1 June 1776 he reached Quebec. A thorough disciplinarian, he practised his troops in the American mode of fighting, particularly in rapidity of firing, in which the Continentals were much more efficient. He accompanied Burgoyne (q.v.) on the ill-fated expedition of 1777, distinguished himself at Ticonderoga, and at Hubbardton brought up reinforcements and dispersed the Americans. At Freeman's Farm 19 Sept. 1777, he saved the British from rout by arriving with his Brunswickers; and, after the action on 7 October, had his counsels prevailed, Burgoyne would probably have made a successful retreat to Canada. He was taken prisoner at Saratoga 17 October, exchanged in 1779, and in that year appointed to a command on Long Island. In 1783 he returned to Germany, in 1787 was promoted lieutenant-general, and in 1788 commanded the Brunswick portion of the army sent from Germany to Holland to assist the Stadtholder. From 1794 until his death he was commandant of the town of Brunswick. The *'Leben und Wirken des General-Lieutenants F. A. Riedesel, nebst vielen Original-Correspondenzen und historischen Aktenstücken'*, by von Eelking, appeared in 1856. An abridged translation into English by W. L. Stone was published in 1868. It affords a most complete and accurate account of Burgoyne's expedition, as well as a clear view of contemporary affairs in Canada.

Riel, *rê-êl'*, **Louis**, Canadian insurgent: b. St. Boniface, Manitoba, 23 Oct. 1844; d. Regina, Northwest Territory, 16 Nov. 1885. He belonged to the Mitis race of Franco-Indians, and as protégé of Archbishop Taché, was educated at the Jesuit College at Montreal. In 1869 he took part in the protest raised by the native tribes against the establishment of Canadian authority in the territories lately acquired from the Hudson Bay Company, and was elected president of a provisional government established at Fort Garry. The rebellion was suppressed the next year by a force under Sir Garnet Wolseley and Riel fled from the territory. In 1873 he was elected to the Dominion parliament for Provencher, but was not permitted to take his seat, and after two subsequent re-elections a warrant of outlawry was issued against him and he was sentenced in 1875 to five years' banishment with forfeiture of political rights. In 1884-5 he headed a party of half-breeds in another insurrection, which was soon suppressed. Riel was taken prisoner, convicted of treason, and executed. See **RIEL'S REBELLION**.

Riel's Rebellion, or the Northwest Rebellion, was an outbreak of the half-breeds and Indians of the valley of the Saskatchewan, in the spring of 1885, promptly suppressed by the Canadian militia. For some time past discontent had been rife among the half-breeds, or metis, of that district, who feared that the surveying of the

country by the Dominion government and the government sales of land to incoming settlers would dispossess them of their homesteads. In June 1884 Louis Riel, the half-breed leader of the abortive outbreak of 1869-70, returned by invitation from Montana and put himself at the head of the movement. At a gathering at Saint Laurent, on the Saskatchewan, September 1884, a "Bill of Rights" was adopted asking that the half-breeds should receive the same grant of 240 acres per capita that had already been given (1870) to their kinsmen in the province of Manitoba. With this demand were coupled more extravagant pretensions to further reservations of land and grants of money. Various petitions had already been sent to the Dominion government in behalf of the half-breed claims. A commission had been appointed to consider them, but the whole matter aroused so little public attention in Canada that the news of the actual revolt in March 1885 came with alarming suddenness. On the 17th of that month the metis formed a provincial government, with Louis Riel (q.v.) as president, Gabriel Dumont as adjutant-general, and a numerous council. All obtainable stores were seized, supplies on the way to Prince Albert intercepted, and the telegraph wires cut. At the same time every effort was made to arouse the Indians of the Saskatchewan district, detachments of whom, under Beardy and One-Arrow, at once joined the rebels. The only forces immediately available to cope with the outbreak were about 500 mounted police, scattered in small detachments over the Northwest Territory, of whom some 200 men of all ranks were distributed between Prince Albert, Fort Carlton, Battleford, and Fort Pitt. The rebels demanded the surrender of Fort Carlton, a mounted police post on the North Saskatchewan, 40 miles above Prince Albert, held by Major Crozier with a handful of men. Crozier refused, and succeeded in communicating with Prince Albert, and obtaining a reinforcement of 40 volunteers. With the help of these he attempted (26 March) to secure the stores from Duck Lake, a post a few miles distant. Here occurred the first bloodshed of the rising. The rebels attacked Crozier near Duck Lake, and forced him to retire to Carlton with a loss of 12 killed and 12 wounded. The mounted police burned the fort at Carlton and retired to Prince Albert. The news of the fight at Duck Lake occasioned intense excitement throughout Canada. Immediate steps were taken to despatch an adequate force of militia to the northwest. General Sir Frederick Middleton, the commander-in-chief, was already on his way. On the 28th of March there was a general call to arms of the militia forces, picked troops from the different regiments being at once forwarded to the front. Various corps of scouts, rangers, cavalry, etc., were specially organized. Eighteen hundred troops started from Ontario and Quebec within six days of the call to arms, and within a month 3,000 men had been transported to the northwest and 1,500 raised in Manitoba and the territories. The area of operations was the valley of the Saskatchewan River, whose north branch runs from west to east through the district of the same name at a distance of about 200 miles north of the Canadian Pacific Railroad and roughly parallel with its course. On this river were the important posts of Prince Albert, Battleford, sit-

ated about 160 miles farther up the river, and Fort Pitt, also on the river, 120 miles northwest of Battleford. The main body of rebels had established themselves at Batoche, on the South Saskatchewan, a river flowing from the southwest to meet its confluent on a long V-shaped angle. Mustering his forces at Qu'Appelle and Swift Current, Middleton resolved to strike into the rebel territory in two columns. The main column, under Middleton, was to move northward on Clark's Crossing, a ferry station on the Saskatchewan about 40 miles by trail from Batoche. A second, under Lieutenant Colonel Otter, was to march from Swift Current (140 miles west of Qu'Appelle) to the relief of Battleford. A third force, gathered at Calgary, was to descend the route of the North Saskatchewan from Edmonton, thus reaching Fort Pitt. Meantime the position of affairs appeared extremely critical. Some 500 Indians in the neighborhood of Battleford had risen under Poundmaker, a Cree chief, laid siege to the stockade fort in which the whites had taken refuge, and plundered the stores of the town. Near Fort Pitt the Indians had also risen under Big Bear, and at Frog Lake, a post about 30 miles distant, on Good Friday (3 April), they plundered the stores and shot down nine persons in cold blood. The news of the massacre spread terror throughout the unprotected valley of the upper river, the settlers fleeing toward Edmonton. Many of the deserted houses were looted and burned. The advance was carried out with admirable success. The main column, the Royal Grenadiers, A Battery and other troops, traversing in forced marches 177 miles of prairie, struck the South Saskatchewan at Clark's Crossing. Advancing northwards down the river, they came upon the rebels strongly posted in a wooded ravine called Fish Creek, in which they had constructed rifle pits. A sanguinary contest ensued (23 April). The rebels, led by Gabriel Dumont, defended themselves stubbornly, but were ultimately dislodged. The loss of the militia was 10 killed and 40 wounded. The second column, under Otter, consisting chiefly of Queen's Own men, left Swift Current 13 April, and after a march of 202 miles successfully relieved the beleaguered fort at Battleford. From there Colonel Otter determined to strike at Poundmaker's reserve, against which he moved on 1 May, with a force of 325 men and three guns. They came upon the Indians in force at Cut Knife Hill, and after a severe engagement were compelled to retire on Battleford, with a loss of 8 killed and 14 wounded. At the same time General Strange, with the third division, marched from Calgary to Edmonton (2 May), and thence directed his forces against Big Bear. Meanwhile General Middleton decided to move forward against the main body of the half-breeds at Batoche. The advanced season rendered possible the navigation of the South Saskatchewan, down which the steamer Northcote, with supplies and munitions, was despatched to join Middleton's column. Batoche was invested by the militia on 9 May, and a four days' fight ensued. The rebels were entrenched in rifle pits along the banks of the river. During the first three days the fighting was desultory. Middleton using his artillery and throwing up earthworks in order to exhaust the ammunition of the half-breeds without unduly exposing his men. The Northcote, that was to

have aided in the attack, steamed down the river under a hot fire on the 9th, but its steering gear being disabled, it drifted past Batoche. On the fourth day a general charge of the militia resulted in a complete victory. The rifle pits and the village of Batoche were taken by storm and Riel and many of his council captured. Dumont escaped to the United States. The loss of the Canadian forces in the four days was 8 killed and 46 wounded; that of the rebels, 51 killed and 173 wounded. With the storming of Batoche the rebellion was virtually at an end. Poundmaker capitulated, and Big Bear fleeing to the north, though offering fight at Frenchman's Butte and Loon Lake, was ultimately captured (2 July). Riel was taken to Regina, where he was tried for treason-felony (July 1885). His counsel attempted to defend him on the ground of insanity but the plea was unavailing, and he was sentenced to be hanged. Numerous petitions were sent from French Canada in favor of commutation of his sentence, with equally urgent petitions to the contrary from various parts of the Dominion. He was hanged at Regina 16 Nov. 1885, meeting his death with great fortitude. Eight Indians were shortly afterwards hanged at Battleford for complicity in the murders at Frog Lake, Fort Pitt and other places. Poundmaker, sentenced to three years' imprisonment, died in the Manitoba penitentiary. For further information consult the 'Official Report on the Suppression of the Rebellion,' Ottawa, 1886; 'Dominion Annual Register' (1885); 'Reminiscences Lieut.-Col. Bolton' (1886). STEPHEN LEACOCK,

McGill University.

Rienzi, rē-ĕn'zē, **Cola di**, Roman popular leader: b. about 1313; d. 8 Oct. 1354. The son of an innkeeper, he became imbued with a passionate desire to re-establish the glory of ancient Rome on the ruins of the oligarchy under whose rule the people suffered. In 1343 he went to the Pope at Avignon, as the representative of the Roman people, and entreated him to return to Rome and end the misrule of the nobles. The Pope made Rienzi apostolic notary, and the latter returned to Rome, where he began the organization of a widespread movement for the overthrow of the aristocracy. On 20 May 1347, Rienzi summoned an assembly of the people at the Capitol, and there proposed a new constitution for the state, providing for the arming of the people and the garrisoning of the walls by them, the reform of justice and the equitable distributing of taxes. He became head of the new republic with the title of Tribune of the People, and by means of the popular levies forced the nobles to leave the city. Rienzi's plans included not merely the restoration of the municipal liberties of Rome, but the re-establishment of the ancient Roman state, and to that end he invited the Italian cities to send representatives to Rome for the consideration of the welfare of Italy. Though few cities responded, Rienzi, carried away by power and his own eloquence, caused himself to be crowned tribune 15 August, and bestowed the Roman citizenship on all inhabitants of Italy. The Pope's hostility, however, was aroused by Rienzi's vainglorious attempt to act as arbitrator in the dispute for the imperial throne that was then in progress, and he stirred up the Roman nobles against Rienzi. The nobles were defeated, but, Rienzi, dazzled by success, began to play the tyrant, and a second insurrection compelled him to flee the city (15

December). Later he went to Bohemia to secure the aid of Emperor Charles II. for the execution of his plans. The emperor handed Rienzi over to Pope Innocent VI., who, however, recognized how useful the tribune might be to him in crushing the Roman nobility and therefore sent him to Rome with Cardinal Albornozi in 1354. Rienzi's popularity was still great and he easily regained power; once more, however, he fell a victim to excess, perpetrated acts of outrage and oppression, and aroused the hatred of the people. An insurrection, stirred up by the nobles of the house of Colonna and Sarelli, broke out on 8 Oct. 1354. The mob stormed the Capitol, and Rienzi, seized as he was escaping in disguise, was murdered, and his body dragged through the streets. The career of Rienzi is the subject of one of Bulwer-Lytton's novels, 'Rienzi' (1835) and of Wagner's opera, 'Rienzi,' first produced at Dresden 20 Oct. 1842. Consult: Pappencordt, 'Cola di Rienzo und seine Zeit' (1841); Auriac, 'Etude historique sur Nicolo Rienzo' (1888); Rodocanachi, 'Cola di Rienzi' (1888).

Rienzi, The Last of the Roman Tribunes, a historical romance by Sir Edward Bulwer-Lytton, published in 1835. It is founded on the career of Cola di Rienzi (q.v.). Bulwer was so impressed with the heroism and force of character of his hero, that at first he meditated writing his biography, instead of a romance founded on his life. The story adheres very closely to the historical facts. Many of the situations and scenes are very strong. The treatment is epic rather than dramatic; and the splendid yet comfortless civilization of the Middle Ages, so picturesque and so squalid, so ecstatic and so base, is vividly delineated. Rienzi is also the subject of a once popular tragedy by Mary Russell Mitford, first published in 1828.

Riesengebirge, rē'zēn - gē - bē'r'gē (the Giants' Mountains), part of the Sudetic chain, separating Silesia from Bohemia and Moravia, till it joins the Carpathians. It contains the loftiest mountains of the north or central parts of Germany. Some of the principal summits are Schneekoppe, 5,257 feet high; the Borenberg and the Grand Rad, each 5,156 feet high.

Riet-bok, rēt'bōk, the Dutch name of a South African species of antelope, *Antelope* (or *Tragelaphus*) *arundinaceus*. It is nearly five feet in length and about three feet high at the shoulder; the horns, about a foot long, are boldly annulated at the base. In color it is of a dull ashy gray, sometimes tinged with red on the upper parts and silvery-gray beneath. As its name (*riet-bok*, reed-buck) implies, it is found mostly among reeds or coarse long grass.

Riff, a name given to the coast districts of northern Morocco extending from Ceuta to the western frontier of Algiers, and forming a line of steep cliffs with few harbors. Its Berber inhabitants were formerly much addicted to piracy, and are still noted for smuggling.

Rifle. See SMALL ARMS.

Rifleman, or **Rifle Bird**, an Australian forest-bird (*Ptilorhis paradisicus*), closely related to the birds of paradise and so called because its colors and ornaments reminded the colonists of the old uniform of the British Rifle Brigade. The male is regarded as more splen-

did in plumage than any other Australian bird. The upper parts are velvety black, tinged with purple; the under parts velvety black, diversified with olive-green. The crown of the head and the throat are covered with innumerable little specks of emerald green of most brilliant lustre. The tail is black, the two central feathers rich metallic green. The female, as is often the case, is much duller colored than her mate. They obtain their insect food largely from beneath the loose bark of trees, about which they scramble like woodpeckers. Consult Newton, 'Dictionary of Birds' (1893-6).

Rifling. See ORDANCE.

Rig Veda, rīg vā'dā, the oldest of the four Vedas, and therefore the oldest literary monument of the Indo-European races. The term Veda is the ancient Hindu Sanskrit word for knowledge, and the Vedas compose the great body of sacred scripture of the older Hindus, written in an ancient form of Sanskrit. The precise time of composition of the Vedas can not be determined, but it is probable that the Rig Veda was in course of composition as early as 1200 B.C., and some authorities contend that some of the verses must have been composed as early as 1500 B.C., the latest date of composition given for any of the verses being 600 B.C. It is known that the Rig Veda was composed by many different generations, and Max Müller believes that for a long period after its composition it was transmitted orally from one to another, and that it was not set down in writing until a much later date, since it contains no allusion to writing or writing materials. Of the four Vedas the Rig Veda is by far the most important, not only on account of its greater antiquity but also because of the information which it contains. The most authoritative writers state that the sacred hymns of the Rig Veda are repeated in a modified form in the Sama Veda, or chants, and in another form in the Yajur Veda, or ritual, while the fourth and latest of the Vedas, the inferior Atharva Veda, shows great modifications from the hymns of the Rig Veda, due to the introduction of superstitions, magic chants and vulgar charms. The hymns of the Rig Veda, in common with those of the three succeeding ones, are of four classes; the first and most important are the mantras, or sacred utterances, usually in metrical form; the next are the Brahmanas, or explanatory inspired utterances, being the oldest Indo-European bodies of prose; last come the Sutras, or rules of the sacrifice. The Rig Veda consists of 1,017 hymns or short lyric poems, with 10,580 verses. It is written in ten books, of which books ii.-viii. contain each the record of a single family or clan; book i., 15 collections, each attributed to a different poet-sage; book ix. glorifies the sacred drink "Soma," and book x. contains hymns supposed to have been composed by many different authors. The religion was nature worship, the chief objects of adoration being Agni, the god of fire, and Indra or Jupiter Pluvius, the cloud-compeller. The Hindu Triad had not yet arisen. The Rig Veda does not recognize the institution of caste. Beef was eaten. Women held a high position, and some of the hymns were composed by them. The rite of suttee was unknown; the conquest of Indra had

only begun, and the Ganges, incidentally mentioned, had not become a sacred stream. "The home of the Rig Veda," says Prof. Hopkins, of Yale University, "has been located in almost as many places as Paradise. Now it is by the Caspian Sea, now it is in Kandahar, but the Punjab is the favorite place, and quite naturally; for the poets are familiar with the Punjab, sing of it, talk of crossing its rivers, and in many ways show that they occupied, in part at least, the country stretching from Peshawar to Delhi." (See *SANSKRIT LITERATURE; VEDA.*) Consult: 'India Old and New: The Rig Veda,' by E. W. Hopkins (New York 1901); 'The Religions of India,' by the same author (Boston, 1895); and the translation by Arrowsmith (Boston, 1886) of A. Kaegi's 'Rigveda.'

Riga, *rē'gā*, Russia, capital of Livonia on the Dwina, seven miles from the Gulf of Riga, an inlet of the Baltic, is one of the principal seaports of the empire and ranks in trade next to Saint Petersburg and Odessa. Of the four parts into which it is divided, the old town alone preserves the Hanseatic features. It is characterized by high storehouses and spacious granaries; market place; other squares, and busy, winding streets. The Saint Petersburg division of the town is the aristocratic quarter. The "Domkirche" (1204) contains one of the largest organs in the world. Saint Peter's Church has a tower 400 feet high. The Castle (1494-1515), built by Walter von Plettenberg, is a spacious building now occupied by the military authorities. Other places of more recent construction are: The Polytechnic, Exchange, municipal picture gallery, schools, gymnasiums and scientific and professional colleges, bonded warehouses and manufactories. At least half of the population is German, the German element predominating in the life of the city. There is an ever-increasing intellectual and commercial development. Riga is a great mart for timber from the vast White Forest, and the third city of Russia for exports, the chief of which are corn, hemp, oats, tallow, leather, tobacco, rugs, and feathers. Much of the interior trade is carried on by both rail and water communications. Pop. (1897) 281,884.

Riga, Gulf of, Russia, an inlet on the east side of the Baltic Sea, 105 miles in length from north to south and about 60 in breadth. The islands of Ösel, Dagö, Mohn, and Worms, lie across the entrance. The chief river which falls into the gulf is the Dwina; seven miles above its mouth is the important commercial seaport of Riga (q.v.), after which the gulf is named.

Rigaud, *rē-gō*, **Hyacinthe**, French painter: b. Perpignan 20 July 1659; d. Paris 27 Dec. 1743. He arrived at Paris in 1681 and, acting under the advice of Lebrun, began to study portrait painting, taking Van Dyck for his model. In 1700 he became a member of the Academy, of which he was elected Professor in 1710 and Rector in 1733. His portraits are all extraordinarily successful as likenesses, his heads are full of character, and the figures have all the studied nobleness in attitude characteristic of the times; while he paints the gay costumes of the court with remarkable truthfulness and brilliancy. Among his most notable works in

the Louvre are the large portraits of Louis XIV. and Bossuet, of which latter a replica or copy is to be found in the episcopal palace at Meaux.

Rig'don, **Sidney**, Mormon leader: b. Allegheny County, Pa., 19 Feb. 1793; d. Friendship, N. Y., 14 July 1876. He was employed in a printing office in Pittsburg in 1812 when a manuscript entitled 'The Manuscript Found, or the Book of Mormon' was offered for publication by Samuel Spaulding (q.v.). The work impressed Rigdon so much that he made a copy of the manuscript before it was returned to the author who died soon after. In 1819 Rigdon became a Baptist preacher and in 1829 made the acquaintance of Joseph Smith, with whom (according to a story denied by the Mormons) he published 'The Book of Mormon,' transforming it by the addition of various pious phrases from an innocent historical romance into a new bible intended as the foundation of a new sect. He accompanied Smith to the West, assisted in founding the Mormon Church and became one of its presidents. He was one of the originators of the "new revelation" authorizing polygamy, and in 1844 on the death of Smith aspired to the leadership. He refused to acknowledge the authority of Brigham Young, was excommunicated, and returned to the East where he lived quietly until his death.

Rigg, **James Harrison**, English Wesleyan clergyman and educator: b. Newcastle-on-Tyne 16 Jan. 1821. He was educated at Kingswood School and in 1845 entered the Wesleyan ministry. He was a member of the London school board 1870-6; principal of the Westminster Training College 1868-1903; and a member of the Royal Commission on Education 1886-8. He edited the 'Quarterly Review' for 15 years and wrote: 'Principles of Wesleyan Methodism' (1850-1); 'The Churchmanship of John Wesley' (1868-78-86); 'Dr. Pusey: His Character and Life-work' (1883); 'Scenes and Studies in the Ministry of Our Lord' (1902); etc.

Riggs, *rīgz*, **Elias**, American missionary and linguist: b. New Providence, N. J., 10 Nov. 1810; d. Scutari, Turkey, 17 Jan. 1901. He was graduated from Amherst in 1829, from Andover Theological Seminary in 1832, was ordained to the ministry and sailed for Greece as a missionary in the same year. He continued his work in Greece from 1832-8, in Smyrna from 1838-53, and from that time was engaged in Turkey. He returned to the United States once, in 1856, for the purpose of publishing his Armenian Bible, and while waiting for the completion of the work taught Hebrew in Union Theological Seminary in 1857-8. The remainder of his life was spent in Turkey. He translated the Bible into Bulgarian, Armenian, and Turkish, and published: 'Manual of the Chaldee Language' (1832); 'Grammar of the Modern Armenian Language' (1847); 'Grammar of the Turkish Language as Written in the Armenian Character' (1856); 'Notes on Difficult Passages in the New Testament' (1889); etc.

Riggs, **John Davis Seaton**, American educator: b. Washington, Pa., 29 Jan. 1851. He was graduated from the University of Chicago in 1878, after engaging in business in Rockford,

Ill., in 1869-75. He was principal of the commercial department in Salt Lake Academy, Utah, in 1878-9, of the preparatory department in the old University of Chicago in 1879-86, and joint principal of University Academy, Chicago, in 1886-7. In 1887 he organized the Granville (now Doane) Academy of Denison University, Ohio, and was its principal until 1896, since when he has been president of Ottawa University, Kansas. He has published: 'In Latinum' (Cæsar) (1890); 'In Latinum' (Cicero) (1892); etc.

Riggs, Kate Douglas (Smith) (Wiggin), American author: b. Philadelphia 28 Sept. 1857. She was graduated at Abbott Academy (Andover, Mass.) in 1878; was the first to organize free kindergartens for the poor of the Pacific coast. She was married to G. C. Riggs in 1895, but continues to use the name "Kate Douglas Wiggin" as a literary signature. Her reputation as a humorist was made by the sketch 'The Birds' Christmas Carol' (1888), and has been well sustained by the cleverness in description and dialogue of her succeeding volumes, among them: 'The Story of Patsy' (1889); 'Timothy's Quest' (1890); 'Polly Oliver's Problem' (1893); 'Marm Lisa' (1896); 'Penelope's Progress' (1898); 'Penelope's Experiences in Ireland' (1901); and 'The Diary of a Goose Girl' (1902). She also edited the anthology 'Golden Numbers' (with N. A. Smith, 1902).

Right, rĕ'ġt. See **RIGI**.

Right is a claim or a title to anything whatever that can be enforced, or a claim to act, possess, or enjoy anything, or the use thereof, or it may exist in the nature of a privilege or power. Right has also been legally defined "as that which one has a legal claim to do; legal power; authority, immunity granted by authority." A legal right is one which is protected by law, and the means of protection is the remedy. The existence of a legal right implies the existence of legal remedy, for one does not exist without the other.

Right-handedness, the property or condition of being right-handed. The propensity in man to use the right hand in preference to the left is generally attributed to the lack of perfect symmetry in the body. If the body could be folded over from a medial line so that each organ of the one side should lie exactly on a corresponding organ of the other, the bodily structure would be highly fitted, in a mechanical sense, for the equal use of either limb, and ambidextral individuals would be the rule. The centre of gravity in the body is a little to the right of such a medial line. This makes the right side the heavier. From a series of experiments the greater weight has been estimated at about 15 ounces. On this fact is founded the mechanical theory of right-handedness, the predominance of the right hand over the left; or, more generally, of the limbs of the right side over those of the left. The three-lobed right lung is more capacious and receives more air during an inspiration than the two-lobed left lung. The liver during inspiration swings toward the right side, shifting the centre of gravity farther to that side. In violent muscular exertion there is more air proportionally inhaled by the lung of the side which

sustains the exertion. Under exertion of the right side the larger lung is better filled than the smaller, and the centre of gravity is removed till it is found in a line passing through the right foot; so that the right leg and foot afford a steadier basis of support than the left would do under similar circumstances. Through the greater use of the right lower limb the right upper limb comes to be preferred. In the case of a light weight, slung on the arm, the equilibrium of the body is better maintained by carrying it on the left side. If the weight be a heavy one, borne on the left shoulder, the burden is really being supported very much by the right limb, owing to the natural curve of the body toward the right side, while sustaining the pressure.

In a very few cases left-handedness has been found to accompany transposition of the viscera. But cases of genuine left-handedness far exceed in number such instances of transposition. Ferrier's researches have proved that when we see with the right eye we see with the left side of the brain. Hereditary left-handedness may be due to the greater development of the right side of the brain. "It is practically certain," says Bastian, "that the great preponderance of right-handed movements in ordinary individuals must tend to produce a more complex organization of the left than the right hemisphere."

In the evolution of man right-handedness has probably been a late acquisition. The oldest discovered records of the human race, however, prove man to have been right-handed. Prehistoric weapons are those of right-handed individuals. Nearly all tools, etc., now in use are made for the right hand.

Right-handedness in man appears to be more persistent than the corresponding quality in lower animals. Naturalists, who observe that adult monkeys catch nuts more with the right hand, that the African elephant digs more with the right tusk, or that the Carolina parrot has a preferential claw for grasping, tell us that these habits are subject to exceptions more numerous than those of left-handedness in human beings.

Right of Way, the right to pass over a certain route or track in going from one place to another. Such a right is a public right of way if enjoyed by everybody; private if enjoyed by a certain person or description of persons (as the residents of a particular farm). Wherever there is a public right of way there is technically a highway, though the phrase is not used in connection with regularly-kept-up public roads, but generally with mere paths, tracts, or by-roads. The origin of a public right of way is generally said to be by dedication of it to the public by the owner of the soil.

Right Whale, the most important of the baleen whales. See **WHALE**.

Rights of Man, Declaration of the, a famous statement of the constitution and principles of civil society and government adopted by the French National Assembly in August, 1789. It suggested the title for Paine's defense of the French Revolution against Burke (1791-2); which was followed by Mary Wollstonecraft Godwin's 'Vindication of the Rights of Women.'

Rights, Declaration and Bill of. See **BILL.**

Rigi, ré'gí, or Righi, Switzerland, in the canton of Schwyz, an isolated mountain rising precipitously between Lakes Zug and Lucerne to a height of 5,905 feet. It may be approached by two railways of special type, and affords fine views, much visited by travelers. Ample accommodation is provided visitors in the way of hotels.

Rig'or Mor'tis, the rigidity of the body which comes on after death. It varies in the time of its appearance and also of its duration, sometimes setting in within a few minutes after the cessation of life, at other times not for many hours, and lasting in some cases but a very brief period, in others for several days. It is believed to be due to the coagulation of fluid substance in the muscular system which occurs after the withdrawal of nutrition from the tissues. Decomposition begins when relaxation of the body follows the passing off of the rigor.

Riis, rés, Jacob Augustus, American journalist, author, and social reformer: b. Ribe, Denmark, 3 May 1849. He came to the United States in 1869, and worked at different trades, until he became a reporter on the *New York Sun*. In this work he gained a thorough knowledge of the conditions in the slums of the city, and by his lectures and writings aroused interest in the reforms in the tenement house district, and became a leader in the reform movement. When Theodore Roosevelt was police commissioner, Riis' thorough knowledge of the city was of the greatest aid to him, and the commissioner was usually accompanied on his all-night tours of investigation by Riis. Under the leadership of the latter police station lodging houses were abolished, small parks in crowded districts opened, playgrounds equipped, and many tenement house evils done away with. He, however, has held but one official position in connection with this reform work, that of secretary of the New York Small Parks Commission in 1897. His first book was 'How the Other Half Lives,' published in 1890; other writings are 'The Children of the Poor' (1892); 'Nibsy's Christmas' (1893); 'Out of Mulberry Street' (1898); 'A Ten Years' War' (1900); 'The Making of an American,' an autobiography (1901); 'Battle with the Slums' (1902); 'Peril and Preservation of the Home' (1903); 'Theodore Roosevelt, the Citizen' (1904).

Riley, ri'li, Charles Valentine, American entomologist: b. London, England, 18 Sept. 1843; d. Washington, D. C., 14 Sept. 1895. He was educated at Dieppe and at Bonn, and in 1860 came to the United States where he spent three years in studying practical agriculture. He then engaged in newspaper work and in 1864 went to the front in the Union army. In 1868 he was appointed State entomologist of Missouri and in that year assisted in founding the 'American Entomologist.' He was president of the Academy of Science at Saint Louis in 1876-7, chief of the United States entomological expedition under the Interior department in 1877, and in 1878 became United States entomologist in the department of agriculture, an office which he occupied until 1894 with the exception of 1879-80 when conducting the cot-

ton-worm investigation. In 1881 he was appointed curator of the National Museum and also became general secretary of the American Association for the Advancement of Science. He invented the "cyclone" or eddy chamber in nozzles for spraying purposes and made numerous discoveries of methods to control insect pests. His publications include: 'Annual Reports on the Insects of Missouri' (9 vols. 1868-77); 'Annual Reports as Entomologist of the Department of Agriculture'; 'Potato Pests' (1876); 'Locust Plague in the United States' (1877); 'The San Jose Scale' (1895); etc.

Riley, James Whitcomb, American poet: b. Greenfield, Ind., 1853. After a public-school education, he became a sign-painter, and, when he deemed himself suitably proficient in art, turned strolling player, and composed songs and remodeled plays for the company of which he was a member. Still later, he was an editorial writer on the staff of the *Indianapolis Journal*. He began to contribute poems to *Indiana* papers in 1873. His verses in the *Indiana* dialect won for him instant success and the sobriquet of "The Hoosier Poet," by which he has been generally known. This work is quite unique in American literature. Riley is not, however, limited to this, but has written with melody and imagination in literary English. His public readings from his books became very popular, particularly in the Western States. The poem 'Leonainie,' written by him in imitation of Poe, proved one of the most successful of literary hoaxes. He found a wide public, and at the beginning of the 20th century was among the most familiarly known *littérateurs* of the United States. His earlier verse and his first book, 'The Old Swimmin' Hole' (1883), appeared over the signature of "Benjamin F. Johnson of Boone." Subsequent volumes are: 'Character Sketches and Poems' (1887); 'Afterwhiles' (1888); 'Pipes o' Pan at Zekesbury' (1889); 'Old-Fashioned Roses' (1891); 'Neighborly Poems' (1891); 'Armazindy' (1894); 'Rubaiyat of Doc Sifers' (1897); 'Home-Folks' (1900); and 'Out to Old Aunt Mary's' (1903).

Riley, John, English painter: b. Bishopsgate, London, 1646; d. there 1691. He did not rise into notice until the death of Sir Peter Lely and remained unsurpassed until the appearance of Sir Joshua Reynolds. He was an imitator of Van Dyck, and in both drawing and coloring must be reckoned one of the best portrait painters of his time. He painted the portrait of Charles II., who rather disconcerted the artist by exclaiming: "Is this like me? Then, odd's fish, I am an ugly fellow." He also painted James II. and his queen, William and Mary, Bishop Burnet, Dr. Busby of Westminster, and Lord Keeper North.

Rimini, rê'mē-nē (ancient **ARIMINUM**), Italy, on the Adriatic, in the province of Forlì, celebrated for its mineral springs, the sea-bathing of the adjacent Porta Marina, and for the massive and elegant architecture of its chief buildings. Its fisheries are extensive. It was the seat of the celebrated Malatesta family. Pop. (1901 of commune) 50,000.

Rim'mon. See **RAMMON.**

Rimouski, rê-moos-ke', Canada, town in the county of Rimouski in the Province of

Quebec; on the right bank of the Saint Lawrence River, and on the Intercolonial railroad; 185 miles northeast of the city of Quebec. The principal occupations are lumbering and fishing; trout and salmon are abundant. It is a favorite summer resort on account of its cool climate and the opportunities for hunting and fishing. Communications by water are cut off about half the year, when the river is frozen. Pop. (1901) 1,295.

Rim'u, or Red Pine, a New Zealand tree (*Dacrydium cupressinum*) of the yew family. It grows to a height of 40 to 80 feet, and from 2 to 6 feet in diameter. The branches are pendulous and feathery, and the leaves slender and needle-like. Its brown wood is valued for general building purposes. The young branches make good spruce beer.

Rinderpest, a general term covering various malignant diseases of neat cattle. Rinderpest proper is an acute infectious disease of cattle and sometimes of other ruminants, characterized by high fever, rapid pulse and cessation of milk-production during the first few days of the attack, followed by congestion and subsequently ulceration of the visible mucous membranes. The mortality is often as high as 90 per cent. This disease is on record since the 4th century. It was first known in eastern Russia and central Asia, whence it has periodically emerged, causing havoc in the herds of cattle and heavy losses to the various European nations. From Europe it spread to Egypt. It appeared in Somaliland in 1889 and spread southward, reaching the Zambesi in 1896. It caused great loss to South African farmers and led to troubles with the natives whose cattle were affected. Inoculation with a prepared virus has given encouraging results as a means of securing immunity. The stamping out process is the only way to combat the disease.

Pleuro-Pneumonia.—This "lung-fever" is a contagious malignant disease of cattle attended by inflammation of and exudation on the pleura and in the lungs. A disease, somewhat similar, has recently attacked goats. This disease has been recognized since the close of the 18th century, and at present occurs in Europe, Asia, Africa and Australia, but is under control in Great Britain. It was introduced into the United States in 1843, and outbreaks were reported at intervals. By 1883 the disease was distributed throughout the Eastern States and as far west as Chicago, and constituted a serious menace to the live-stock interests of the country. No temporary measures could be used in dealing with this scourge. The only ones practicable were quarantine, restriction of movement of cattle, slaughter of affected animals and disinfection. The wisdom of such measures is vouched for by the results. Less than five years of time and the expenditure of \$1,500,000, under the auspices of the Bureau of Animal Industry of the Department of Agriculture at Washington, sufficed to place this disease under control, and no case has been reported in the United States since 1892.

Anthrax.—This is a specific infectious disease of mammals including man, also known as splenic fever, charbon, wool-sorters' disease, etc., due to the presence in the blood of the micro-organism *Bacillus anthracis*. The dis-

eased animal may suddenly fall to the ground as in apoplexy and die, or it may live 10 to 24 hours or more in a sub-acute case. The symptoms are a high temperature, muscular trembling and labored breathing with prostration. The presence of the germ in the blood is proof of the disease. All carcasses should be burned, as if buried the germs may remain in the soil or be carried in the soil water. Cattle may be immunized by inoculating with attenuated virus, with toxins or antitoxin serums. Anthrax vaccine is on sale.

Blackleg, quarter-ill, etc., called also symptomatic anthrax, usually attacks young cattle. It is due to a bacillus. Immunity to this disease is conferred by vaccination with black-leg vaccine.

Texas, Southern, or Spanish Fever.—Texas fever is a contagious fever of cattle caused by a parasitic protozoan (*Pyrosoma bigeminum*), and is carried from southern cattle to northern cattle by the southern cattle-tick (*Boophilus borealis*). Adult ticks fall from the cattle, lay eggs, and thus infest the soil with young ticks that carry the germs. Northern cattle passing over the ground, get the ticks and subsequently the fever. When the ticks fasten themselves to the skin of cattle, they inoculate them with the parasites, which, in an unimmune animal, rapidly multiply, enter and destroy the red corpuscles of the blood, causing high fever and a temperature of 106° F. or more, general weakness and finally death. In the later stages the urine is highly colored, showing the great loss of red blood cells, giving rise to the name "red-water" for the disease. These symptoms and the presence of the ticks enable the disease to be recognized. Post-mortem examination reveals an enlarged spleen, containing a dark tarry substance instead of normal pulp. The ticks can be destroyed by dipping the cattle in a light lubricating oil containing dissolved sulphur. In the South cattle may be kept free from the fever by keeping them free from ticks in an uninfected enclosure. Young calves may be rendered immune by keeping ticks on them, and a considerable degree of immunity can be conferred on animals by inoculating them with the blood of southern cattle, thus producing the fever. This disease is thoroughly disseminated throughout the southern parts of the United States, and in 1890 regulations were promulgated establishing a Federal quarantine line from Virginia to California, and controlling the movement of southern cattle into the Northern States.

Foot and Mouth Disease or Aphthous Fever.—This is a contagious eruptive fever, attacking cloven-footed animals and communicable to many others, including man. Eruptions occur as blisters in the mouth, on the udder, teats and feet, with an elevation of temperature of from 2 to 6 degrees. Although in mild attacks only 2 to 3 per cent of the animals attacked succumb, it depreciates the value of the survivors from 20 to 50 per cent. When present in a malignant form, 5 to 50 per cent of the adults die, and 50 to 80 per cent of the calves. It is more to be feared than pleuro-pneumonia. The milk from diseased cows may transmit the disease to those partaking of it, and the disease produced in this manner is, especially when it attacks children, serious and sometimes fatal. The disease was first seen and recognized in

England in 1839 where it continued with more or less prevalence until 1886, when it abated only to reappear in 1892, 1894 and again in 1902, although no cattle were imported into the United Kingdom during this period. In 1870 it was introduced into the United States from Canada. In 1886 it was very prevalent in Europe and has continued its ravages to the present time. The introduction of the disease into New England in 1902 drew attention to the dangers of the malady. Isolation and quarantining of diseased animals is futile, and slaughter of diseased animals and prohibition of movement of stock in the infected areas are looked upon as the most efficacious method of eradicating the disease.

Tuberculosis.—One of the most insidious diseases affecting cattle and other animals. Like human tuberculosis, it is due to a germ, the tubercle bacillus which may affect any part of the body where it can secure a lodgment. Recent investigations show that the same bacillus may cause human and bovine tuberculosis, hence there is need to guard against human infection with bovine tuberculosis, and particularly to guard children from tuberculous milk. Plenty of good food, fresh air and sunlight, rigid cleanliness, the use of disinfectants, and the determination and isolation of affected animals are now viewed as the best means of checking the disease. The tuberculin test is a ready means of determining whether or not cattle are tuberculous. Tuberculin is made by growing the bacterium for two or three weeks in bouillon to which glycerine is added. The germs are then killed by heating and their remains removed by filtration. Carbolic acid is added to prevent decomposition and the fluid is packed in sealed sterilized bottles. Inoculation with this fluid causes a rise in temperature in the case of diseased animals.

Bibliography.—Consult 'Reports' of Bureau of Animal Industry, Washington, D. C.; Fleming, 'Manual of Veterinary Science and Police' (London, 1875); Friedberger and Frohner, 'Lehrbuch der speciellen Pathologie und Therapie der Haustiere' (Stuttgart, 1900); 'Report' of Seventh International Congress of Veterinary Surgeons (Baden Baden, 1899); 'Bulletins' 53 and 63 (Texas fever), Agricultural Experiment Station, Texas; 'Special Report on Diseases of Cattle and Cattle Feeding,' U. S. Department of Agriculture, (Washington, 1892); Law, 'The Farmer's Veterinary Adviser' (Ithaca, N. Y., 1892).

S. FRASER.

Rinehart, rin'härt, William Henry, American sculptor: b. Carroll County, Md., 13 Sept. 1825; d. Rome 28 Oct. 1874. He apprenticed himself at 21 to a marble-worker of Baltimore, and 10 years later went to Italy where he remained two years. On his return to Baltimore he executed several busts, and a fountain for the U. S. general post-office. He did not stay long in the United States, though his success as a sculptor met with much appreciation here, but established himself in Rome in 1858. Among his best known works are the reliefs 'Night' and 'Morning'; his highly poetic and well-wrought 'Clytie' and 'Love Reconciles with Death'; 'Latona and her Children'; 'Antigone'; 'Atlanta'; and 'Endymion.' He fin-

ished the bronze doors for the national Capitol, a work bequeathed to him by Crawford.

Rines, George Edwin, American editor: b. Maitland, Hants County, N. S., 28 Dec. 1860. Coming to the United States when 11 years old his early education was obtained in the public schools of Brooklyn, N. Y. For several years after graduating from the high school there he engaged in mercantile life, but in 1887 resumed his studies at Colgate University, Hamilton, N. Y. In 1890 he entered the full Hebrew and Greek course in theology, and graduated from the Hamilton Theological Seminary in 1893. He was for two years pastor at Binghamton, N. Y., afterwards accepting a call to the pastorate of the First Baptist Church of Ridgewood, N. J., where he remained for three years. He resigned from the ministry to devote himself to literary work, and has been a frequent contributor to religious and other periodicals. In 1903 he was appointed managing editor of the 'Encyclopedia Americana,' to which he has contributed many articles.

Ring, an ornament for the fingers which has been worn from the most ancient period of civilization. Among the ancient nations who are known to have attached special importance to the wearing of rings are the Assyrians, Egyptians, Hebrews, Greeks, and Romans. From the earliest period rings are associated with signets, and appear to have been worn as ornaments, especially by females, on various parts of the body besides the hand. The nose, ears, arms, and even the legs and toes have, among various peoples, been decorated with them. Rings have also from a very early period been reckoned as symbols of authority, and that in a double aspect. As a mere ornament rings would serve to represent dignity and honor, and as signets they were early used officially to delegate authority. Rings and bracelets are mentioned among the presents made by Abraham's servant to Rebecca. Among the Egyptians rings were worn in great profusion. They were made of gold, with an engraved stone or scarabæus, and were often very massive. The Egyptian rings were often of great size, so as to cover the space from one joint to another of the finger. In Sparta only iron rings were used. The Romans are variously said to have adopted the use of rings from the Sabines, the Etruscans, and the Greeks. For long they were made chiefly of iron, though sometimes of stone, and every free Roman had the right to use a seal-ring. The association of rings with marriage may have come down to us from the Romans, the bridal-ring being regarded as a pledge for the fulfilment of a contract. At first ring-wearing was confined to men among the Romans and was practised only to a limited extent, but growing luxury led to the excessive use of rings by both sexes. The right of wearing gold rings was at first accorded only to ambassadors, chief magistrates, senators, and finally to persons of the equestrian order, while silver began to supersede iron among ordinary citizens. Till the close of the republic the use of gold rings was a privilege of the equestrian order. A ring appears from an early period to have been one of the insignia of the office of a bishop and was often worn. The restoration of a deposed bishop was effected at the Council of Toledo (633) by returning to him the episcopal ring. Rings have always been in great demand among savage tribes when they have either had ingenuity enough to invent them, or have

RING AND THE BOOK — RINGGOLD GAP

come in contact with civilized nations who use them. Superstitious as well as sentimental feelings have often been associated with rings, and especially with the precious stones worn in them, to which particular characters were assigned. Rings were also used as charms against demons, evil eye, and other ills and inconveniences. Motto rings date from the time of the Romans; they appear also to have been in use among the Jews. They were long popular in Great Britain under the name of posies. See JEWELRY.

Ring and the Book, The, a poem of 21,000 lines by Robert Browning. This dramatic monologue, the longest and best sustained of Browning's poems, was published in four volumes in 1868-9, and is his greatest constructive achievement. It contains ten versions of the same occurrence, besides the poet's prelude, and presents from these diverse points of view the history of a tragedy which took place in Rome 170 years before.

Ring-bone, a bony excrescence on the pastern of a horse. It is a morbid growth, callus or exostosis, commonly due to inflammation, and in some cases extending to toe-joints with disabling effect. It is one of the more frequent ailments of horses and, although ordinarily affecting animals of inferior condition or injured by overwork, it sometimes appears in very young colts. While not always visibly impairing the serviceableness of a horse, ring-bone usually depreciates the market value of animals affected with it, and as cure is practically impossible it is a defect which calls for particular preventive methods in the care and breeding of horses, and for cautious scrutiny in the purchase of them.

Ring-dove, or **Cushat**. See DOVE; PIGEON.

Ring-money, in numismatics, an ancient metallic currency in the form of rings. This seems to have originated with the Egyptians, with whom rings were freely used as ornaments, and the same rings appear to have answered both purposes. The use of ring-money in Africa subsists to this day. A form of ring-money was also anciently used in Ceylon.

Ring-ouzel, oo'zl, a European thrush (*Turdus torquatus*), rather larger than a blackbird and of shy habits, preferring mountain slopes, heaths, and wild land to cultivated districts, but it often makes raids on fruit gardens and in vine countries feeds largely on grapes. In some parts of Scotland it is known as the moor blackbird. The song consists of a few loud, clear, and plaintive notes, and is somewhat monotonous. It is dark-brown with grayish wings and has a broad crescentic white gorget, whence the name. See OUZEL.

Ring Plover, or **Ringneck**, a common plover or dotterel (q.v.) of the whole northern hemisphere (*Ægialitis hiaticula*), distinguished by its black collar and its brilliant, gold-colored eyes. This bird was formerly celebrated in European folk-medicine. To be cured of the jaundice it was held to be only necessary to look fixedly at the bird's eyes with a firm faith in the success of the experiment. See PLOVER.

Ring Snake, the name of various serpents with a band encircling the body, especially

at the neck. In the United States the name belongs especially to a small harmless serpent of the warmer States (*Diadophis punctatus*), which is found "coiled up under stones, logs or the bark of fallen trees, chiefly in forests." It is bluish black above, yellowish orange beneath and has a whitish collar. In Great Britain the common grass-snake (q.v.) is often so called; in South America, the many-banded coral-snakes and in South Africa a large black and yellowish venomous hooded snake (*Sepeidon hamachates*) known to the Dutch as "ringhals," and differing from the cobras only in anatomical peculiarities. Consult Gadow, 'Amphibia and Reptiles' (1901).

Ring-tailed Lemur. See LEMUR.

Ringgold Gap, Battle of. After the expulsion of the Confederates from Missionary Ridge 25 Nov. 1863 they retreated on Dalton (see CHATTANOOGA, BATTLE OF). To intercept the retreat, Gen. Thomas, on the morning of the 26th, ordered Gen. Hooker to push on to Graysville, from near Rossville, and directed Gen. Palmer, commanding Fourteenth corps, to report to Hooker and join in the movement. On reaching Pea Vine Creek Palmer was ordered to move directly on Graysville, while Hooker, with his three divisions—Osterhaus', Geary's, and Cruft's—moved on Ringgold to strike the Confederate line of retreat six miles farther, south. At 9 P.M. Palmer struck the Confederate rearguard, capturing three guns and some prisoners. Pushing on to Graysville, which was reached at 11 P.M., he captured more prisoners and another gun, and bivouacked for the night. Hooker advanced to within six miles of Ringgold, and late in the night bivouacked a short distance to the right of Palmer. At daybreak of the 27th Hooker renewed the pursuit, Osterhaus' division, in the advance, capturing many prisoners, and pursuing the Confederates into Ringgold. At 3 A.M. of the 27th Gen. Cleburne, whose division was acting as rear-guard to Hardie's corps, received an order from Gen. Bragg to hold Ringgold Gap, in Taylor's Ridge, near the town, until the trains and rear of the retreating troops could get well advanced. Cleburne disposed his four brigades of about 4,200 men on the ridge, on each side of the gap, and as a support two guns in it, and in less than half an hour Hooker came up and Wood's brigade of Osterhaus' division was ordered to attack. Cleburne's skirmishers were soon driven in; but Cleburne, assuming the offensive, attacked Woods' main line and was repulsed, Wood's men following to the gap. Meanwhile Williamson's brigade had made a lodgment on a spur of Taylor's Ridge, half a mile to the left of the gap, but found the Confederates so strongly posted that it could make no headway, and Creighton's brigade of Geary's division was ordered to ascend the ridge still farther to the left. Cleburne had anticipated the movement by still farther extending his right. Col. Creighton, making a gallant assault, was badly repulsed, and in falling back he carried part of Williamson's brigade with him. While Creighton was preparing for another assault he was killed, and operations on that part of the field were suspended. Meanwhile sharp work was going on in the gap and on the line on either side of it, without any material advantage to

RINGWORM—RIO GRANDE DO NORTE

Hooker. Between 12 and 1 o'clock Hooker's artillery came up and opened a furious fire upon Cleburne's position, but Cleburne had gone, leaving only a few skirmishers in the gap. These were closely followed by some of Geary's men to the bridges beyond the gap. Gen. Grant arrived on the field early in the afternoon, and ordered pursuit discontinued; later in the day Grose's brigade went forward, but encountering cavalry, supported by infantry, it returned to Ringgold. The Union loss at Ringgold Gap was 65 killed and 377 wounded. The Confederate loss, as reported by Cleburne, was 20 killed, 190 wounded, and 11 missing. Consult: 'Official Records,' Vol. XXXI.; and Van Horne, 'History of the Army of the Cumberland,' Vol. I.

E. A. CARMAN.

Ring'worm, a disease occurring in three varieties, in one of which it attacks the scalp, in another the beard, and in the third some other part of the body. In all cases it is due to the presence of a vegetable parasite, consisting of minute round bodies, and of thread-like structures formed of rows of rod-shaped bodies of a beaded appearance. This is the growing fungus (*Trichophyton tonsurans*) and its spores, and wherever ringworm occurs this is present between the layers of cells of the scarf-skin, in hairs and hair-sheaths. Ringworm of the body (*Tinea circinata*) is the name given to the disease when it occurs on non-hairy parts of the body. It is most common on the face, neck, and trunk, but it also occurs on the hands, arms, and wrists. It consists of small circular patches, rose-colored and slightly raised, covered with small branny scales. Usually round the margin is a ring of very small blisters. The spot is the seat of a tingling and itching sensation. It spreads round the margins, and as it spreads the centre heals up, so that a large red ring with a pale centre is formed. Ringworm of the scalp (*Tinea tonsurans*), identical with favus (*Tinea favosa*), begins with small red patches like those described above and spreads at the margins. It involves the hairs, which become penetrated by the fungus, and are dry, dull, and twisted. They are easily pulled out and become very brittle. The affected patch becomes covered with a grayish-white powder. Inflammation may be produced and crusts formed. This variety of ringworm is commonest in children. Ringworm of the beard (*Tinea sycosis*) is similar to the scalp variety. A lotion of bichloride of mercury is often sufficient to kill the fungus, but if it prove ineffectual glacial acetic acid may be painted all round the spreading margins of the ring. In ringworm of the head and beard the hair of the diseased patches and for a little distance beyond should be cut short, and crusts should be removed by poulticing, washing with water and soft soap, etc. The general health should be maintained by the use of tonics and otherwise. Ringworm is very contagious.

Rio Branco, rē'ō brāng'kō, a large river of Brazil, entirely in the state of Amazonas. It rises on the eastern slopes of the Serra Parima, near the sources of the Orinoco, flows eastward parallel to the Serra de Pacaraimo, turns southward before reaching British Guiana, and joins the Rio Negro about lat. 1° 25' S., lon. 61° 10' W. It has a length of about 830 miles, and receives numerous affluents.

Rio Cuarto, koo-är'tō, Argentina, a town of Córdoba province, near the source of the Cuarto River, on the railroad midway between Belleville and Villa Mercedes, 119 miles south of Córdoba. It is the distributing centre of a large agricultural region. Pop. 14,000.

Rio Grande, rē'ō gränd (Sp. grän'dā), or **Rio Grande del Norte**, a river which has its rise in the southwestern part of Colorado, flows south and southeast until it enters New Mexico, when its general course about half way across the Territory is south by west, then south by east to El Paso (q.v.), whence it forms the irregular boundary between Texas and Mexico. It enters the Gulf of Mexico after a course of nearly 1,900 miles. It is navigable for small boats only to Kingsbury Rapids, near Presidio, about 460 miles from its mouth. In the upper course the banks are generally high, and the irregular rocky beds form rapids and waterfalls. In the lower part of its course, the stream is shallow, and it is subject to periodical inundations. The largest tributary is the Pecos River, which enters the Rio Grande from Texas. A number of U. S. forts are on this river. The most important places are Brownsville, Eagle Pass, Laredo, and El Paso in Texas; and Matamoras and Nuevo Laredo in Mexico. A few villages and towns of importance are on the banks of the river in New Mexico.

Rio Grande de Cagayan, rē'ō grän'dā dā kă-gă-yän', the largest river of the island of Luzon, Philippines. It rises on the northeastern slope of Carabellos Sur, and flows north in a winding course to the China Sea. It drains a large territory, and has numerous tributaries, the chief of which are the Magat and the Chico de Cagayan; its valley is very fertile, the land being used mainly for the cultivation of tobacco. The river is navigable for vessels drawing 12 feet as far as Lal-ló, 13 miles from its mouth; and for light draft vessels for 200 miles in the wet season. Freshets occur at times with a rise of several feet in a few hours.

Rio Grande College, located at Rio Grande, Ohio; founded in 1876 under the auspices of the Free Baptists. It offers a classical and a scientific course, and confers the degrees of bachelor of arts and bachelor of science. There is also a preparatory department. The college is co-educational, and women constitute fully one half of the student body. The grounds and buildings in 1903 were valued at \$40,000; the library contained 3,000 volumes; the productive funds amounted to \$72,000; and the annual income to \$5,000. The students numbered 110, and the faculty 8.

Rio Grande de Mindanao, rē'ō grän'dā dā mên-dā-now'. See MINDANAO, GRANDE DE.

Rio Grande do Norte, rē'ō grän'dā doo nōr'tā, an important maritime state in the northeast of Brazil; area, 22,106 square miles. The surface is mountainous in the south and southwest, where it is covered by several mountain ranges. The principal rivers have all either a north or an east direction. The proximity to the equator makes the climate intensely hot; it is said, however, not to be unhealthy, the air being remarkably pure. The soil is generally good, but not remarkable for its fertility. For a long time the sugarcane was the principal cultivated crop, but considerable tracts formerly

RIO GRANDE DE LA PAMPANGA — RIO DE JANEIRO

devoted to it are now occupied by cotton, which may be regarded as the staple of the province. The other leading crops are manioc, millet, and haricots. Many of the plains are grazed by large herds of horses and cattle. The minerals include gold, silver, iron, salt, amethysts and rock-crystals, limestone, sandstone, and granite. The forests are not very extensive. Pop. 268,273.

Rio Grande de la Pampanga, *rē'ō grān'dā dā lā pām-pān'gā*. See PAMPANGA, RIO GRANDE DE LA.

Rio Grande do Sul, *rē'ō grān'dā doo sool*, a southern maritime state of Brazil; area, 91,336 square miles. Along the coast for more than half the extent of the coast-line of this state stretches the great Lago dos Patos, which communicates with Lake Mirim, and which receives the rivers of the southeastern part of the territory. Those to the southwest belong to the basins of the Paraná and Uruguay, and flow west. The mountain chain called Serra Geral divides the state into two unequal parts. The sea-coast is flat and sandy, and is lined by a series of reefs, which make the navigation dangerous. The interior is partly occupied by arid serras, but is mostly fertile. The climate is temperate, and the productions are more like those of Europe than of the rest of Brazil. Maize, rice, and flax, particularly the first, are largely cultivated. The finer European fruits, especially figs and peaches, find a genial soil. The minerals include gold, iron, sulphur, and porcelain clay of the finest quality. The chief occupation of the inhabitants is the rearing of cattle and the preparation of dried beef. Horses and mules are also reared. A number of German colonists and many Italians have settled in the state. There are several railways. Porto Alegre is the capital. Pop. 897,455.

Rio de Janeiro, *rē'ō dā zhā-nā'rō*, Brazil, one of the maritime states on the southeast coast of the republic; area, according to official returns, 26,634 square miles. The central part of this territory is mountainous, being traversed generally from east to west by a series of ranges, of which the loftiest and most conspicuous is the Serra dos Órgãos or Organ Mountains (q.v.). They are almost entirely composed of granite. The mountains slope down on the north and south—in the former direction toward the basin of the Parahyba, to which all the surface of the province on that side belongs; and in the latter to the coast, which receives the drainage from a great number of comparatively small streams, each carrying its waters directly to the ocean. The shore toward the northeast is lined by numerous lakes and lagoons. The soil does not seem to possess much natural fertility. Great part of it consists of a retentive clay, ill adapted for agricultural operations; but the warmth and moisture of the climate are so favorable to vegetation that magnificent forests and valuable crops are found, and there are many tracts of the richest land which are turned to the best account. The crop which attracts the largest share of attention is coffee. The other leading crops are sugar, rice, millet, manioc, and cotton. The forests are rich in timber, both for ordinary and ornamental purposes; in dye-woods, in gums and balsams, and valuable medicines. The domestic

animals, originally imported from Europe, have increased considerably, and immense herds of cattle are reared. This province is not rich in precious metals. Iron, however, abounds, though it is not worked; and the decomposition of granite has formed extensive beds of the finest kaolin. The state assembly used to meet at Nictheroy, but Petropolis is the present capital. Under separate jurisdiction from the state is the federal district of Rio de Janeiro, embracing the city of the same name (q.v.) and its surroundings. The population, inclusive of the federal district, according to the census of 1890, was 1,399,535.

Rio de Janeiro, capital of the United States of Brazil; socially and commercially the most important city of South America, excepting Buenos Ayres. The name is supposed to perpetuate an error of the discoverers (1 Jan. 1502), who, seeing the great length of the bay, assumed that it was the mouth of a river (*rio*). It is, in fact, a capacious and excellent natural harbor, with an area 68 square miles greater than the combined areas of the lower and upper bays of New York. But the bottom has silted up so much in recent years that the water near the shores has become too shallow for large vessels. Accordingly, some of the old mooring places have been abandoned. Merchant vessels which are unable to reach the docks cast anchor on the north side of the city, and their cargoes are transported in lighters. The future prosperity of Rio depends upon the successful execution of the plan for harbor improvements, which in 1903 was entrusted by the government to a British firm. Modern facilities for handling freights are to be provided in connection with a wide quay of solid masonry, which will extend along the entire northern front to a deep artificial channel. The outer wall of this quay, for about two miles, will be accessible to the largest shipping, and railway trains will run to the same point. This important work will, it is thought, be completed in 1910. The city proper is very compactly built on flat land adjoining the bay, but its suburbs stretch out along the shores for more than 17 miles. Above the crowded central portion rises Sugar Loaf Peak (*Pão d'Assucar*), and on the same side of the harbor is the fortress called São João—opposite which, on the eastern promontory, is Santa Cruz fortress. A small island, lying in the entrance between São João and Santa Cruz, is also fortified; and other defensive works are located in the bay on an island, which takes its name from the French adventurer Villegaignon, who tried to establish a colony of Huguenots there (1555-60). The main body of the city, covering less than a square mile, is divided into regular squares by narrow streets, along which pass lines of electric or horse cars, furnishing the only available means of transportation. The length of these lines is about 175 miles, and in 1897 the companies carried 83,000,000 passengers. The number of buildings in Rio is approximately 50,000, and its total area is sometimes said to be equal to that of any other capital in the world, but in such reckonings forest-covered hills are included. The most attractive suburban districts are Botafogo and Laranjeiras, the former built around an arm of the bay, the latter in a valley at the foot of

RIO NEGRO — RIOJA

Mount Corcovado; in both the residences are surrounded by beautiful tropical gardens. The National Museum, formerly the Imperial Palace of Boa Vista, is in the district of São Christovão. Some of the finest buildings—the Senate, City Hall, Mint, Normal School, Quartel-general, etc.—surround the old park, Praça 15 de Novembro, now called Campo de Sant' Anna. The Department of Foreign Relations occupies the old Palace of Itamaraty; the present government palace was formerly the luxurious residence of Conde de São Clemente the Chamber of Deputies, Department of Telegraphs, and Historical Institute are installed in the old Paço Palace. On the other hand, a fine modern building is devoted to the Department of Industry. An especially interesting feature is the Botanical Garden, in which rare exotics from all countries of the globe are cultivated, side by side with specimens of the flora of the various parts of South America. The Cathedral and Church of Santa Cruz stand near the water front, in a large square from which starts the main business street, Primeiro de Março. The rendezvous for men of prominence, an "open-air club," and the active centre of municipal life, is the Rua Ouvidor, a street of restaurants, book-shops, and newspaper offices. The very large wholesale and foreign trade of the city is in the hands of Portuguese, Brazilian, English, German, and French merchants. In the list of exports, coffee is the principal item; imports consist chiefly of food products and manufactured articles. There are at Rio cotton mills, furniture manufactories, foundries, dry docks, a naval arsenal, etc. A system of railways, of which the capital is the centre, covers the state and the southern part of Minas Geraes. The "Brazil Central" system is the most important in the republic, connecting Rio with São Paulo, and having a large number of branch lines, beside controlling the terminal facilities of the port and the suburban traffic. Originally known as the Dom Pedro Segundo Railway, this line was begun by a company in 1857, under a governmental guaranty. In 1860 the imperial government took control of it. Since the establishment of the republic the line has been extended to a length of 759 miles, and the cost of this system to the government has been approximately \$97,300,000 gold, or \$126,000 per mile. The road is moderately well built and equipped. Beside the numerous suburban trains, there are seven daily trains running to Barra do Pirahy, the junction point of the São Paulo and Minas divisions. Vessels entering the port in 1900 numbered 1,703, including 860 coasting vessels; those clearing numbered 1,707 (coastwise 917). The number of inhabitants in 1900 was 750,000. On account of "poor sewerage and lack of hygienic measures," the city is one of the most unhealthful in Brazil. Yellow fever is endemic; smallpox and tuberculosis make great ravages from time to time. In the low-lying central section the heat of summer is exceedingly unpleasant, though elevated places in the vicinity—Corcovado Mountain, Petropolis (q.v.), Nova Friburgo, and other resorts—have an admirable climate. The water supply is regarded as very good. For public instruction see EDUCATION in LATIN AMERICA. Useful institutions of public charity are the hospitals of the Sociedade de Beneficencia and the

very large Santa Casa de Misericordia, the former supported by the philanthropic Portuguese colony. Some events in the early history of this region are mentioned in the article BRAZIL. In Rio and São Paulo in 1870 was organized the Republican party, which brought to pass the overthrow of the monarchy without bloodshed (15 Nov. 1889); and the bay of Rio de Janeiro was the principal scene of the revolt of the navy, which, from 6 Sept. 1893 to March 1894, menaced the new Brazilian institutions. Compare: 'United States of Brazil: A Geographical Sketch,' Washington, Government Printing Office (1901). MARRION WILCOX, *Authority on Latin America.*

Rio Negro, rē'ō nā'grō ("black river"), the name of numerous streams, of which two are important: (1) A river of South America, and principal tributary of the Amazon. It rises in Colombia, and joins the Amazon after a course of about 1,000 miles at Manaos, Brazil. Through its affluent, the Cassiquiare, there is direct communication between the Amazon and Orinoco. (2) A river of South America forming the boundary between the Argentine Republic and Patagonia. It rises in the Andes in Chile, and is about 700 miles long. Its current is very rapid, and its bed obstructed with shoals and sand banks.

Rio de la Plata, rē'ō dā lā plā'tā. See PLATA, RIO DE LA.

Riobamba, rē-ō-bām'bā, Ecuador, a town on the Pastasa River, a branch of the Amazon, about 100 miles from Quito. A former town of the same name, at the foot of Chimborazo Mountain, about 9 miles from the present town, was destroyed by an earthquake in 1797. Riobamba has a population of about 17,000, most of them Indians.

Rioja, Francisco de, frän-thēs'kō dā rē-ō'hā, Spanish lyric poet: b. Seville about 1600; d. Madrid 8 Aug. 1659. He studied first law and then theology. The minister Olivarez obtained for him a prebend in the cathedral of Seville, and then became royal historiographer, inquisitor at Seville, and lastly, inquisitor of the supreme tribunal of the holy office. The downfall of his patron involved his own: he was imprisoned, and only obtained his liberty after he had undergone a formal trial and completely established his innocence. Philip IV., whose favor he had regained, made him director of the royal library and councillor in the supreme court of the Inquisition. As a poet, he formed himself on the classic and Italian models, particularly Horace and Seneca; kept himself, in style and language, free from the tasteless eccentricities of his contemporaries, and thus preserved the true spirit of the lyric. His 'Silvas' exhibit rich pictures of rural life, remarkable for their truth to nature. His works were published with a biography by D. Cayetano de la Barrera, 'Poesias' (1868); and 'Adiciones a las poesias de D. Francisco de Rioja' (1872). Consult Longfellow, 'Poets and Poetry of Europe' (1843).

Rioja, La, Argentina: (1) the capital of a province 118 miles by rail southwest of Catamarca, at the foot of the Sierra Velasco, in the midst of vineyards and orange groves. Pop. (1900) 5,931. (2) A western province north

of San Juan and south of Catamarca, with an area of 69,502 square miles, divided into 18 departments. While in the east and south there are salt and sand deserts, it is well watered on the west, and agriculture and cattle rearing are important industries. Excellent wheat, fruits, and wine are produced. The climate is dry and healthful. Near Chilecito and Famatina are valuable gold, silver, and copper mines. Pop. (1900) 77,783.

Rion, *rê-ôn'*, or **Rioni**, *rê-ônē*, from **Phasis**, a river of Colchis (Transcaucasia, Asiatic Russia), anciently regarded as the boundary between Europe and Asia. It was afterward held as the boundary line between Colchis and Asia Minor. It rises in a spur of the Caucasus (Moschici), and after receiving the rivers anciently called the Rhion, the Glau-cus, and the Hippus, it falls into the Euxine near the ancient town of Phasis. In the early part of its course it was called the Boas. Its modern name is Rion or Rioni. Other rivers were sometimes confounded by ancient writers under the same name with this. The Phasis of Xenophon was the Araxes.

Riordan, *rê'ôr-dan*, **Patrick William**, American Roman Catholic archbishop: b. New Brunswick 27 Aug. 1841. He was educated at Notre Dame, Ind., and was graduated from Louvain, Belgium in 1864. He then returned to Chicago, accepted the chair of theology at the Seminary of Saint Mary's of the Lake, and in 1868-71 was pastor of Saint Mary's church at Joliet, Ill. From 1871-83 he was in charge of Saint James' Church, Chicago, and in the latter year was consecrated titular arch-bishop of Cabesa and was made coadjutor. He succeeded to the see of San Francisco in 1884.

Riordan, **Roger**, American artist and author: b. Ireland 1848. He studied art at the Art Students' League in New York, has contributed as illustrator and writer on art subjects to various magazines, and served on the international jury of awards at the Paris Exposition, 1900. He has published 'Sunrise Stories, a Glance at the Literature of Japan'; 'French Etchers,' and collaborated on the Catalogue of the Marquand collection.

Riot, a disturbance of the public peace, attended with circumstances of tumult and commotion, as where an assembly destroys, or in any manner damages, seizes, or invades private or public property, or does any injury whatever by actual or threatened violence to the persons of individuals. By the common law a riot is an unlawful assembly of three or more persons which has actually begun to execute the common purpose for which it assembled by a breach of the peace, and to the terror of the public. A lawful assembly may become a riot if the persons assembled form and proceed to execute an unlawful purpose to the terror of the people, though they had not that purpose when they assembled. In England, every person convicted of riot is liable to be sentenced to hard labor. In Scotch law rioting is termed mobbing. A person may be guilty of mobbing who directs or excites a mob, though he is not actually present in it. Mere presence without participation may constitute mobbing. A majority of the States of the American Union have riot acts somewhat similar to those of England, and the

common law governs where no statutes have been enacted.

Riouw-Lingga, *rê'ow lin'ga*, or **Riou Linga**, an archipelago southeast of the Malay Peninsula, belonging to Netherlands. It is formed of two groups of islands, the northern group is that of Riouw, and the southern, Lingga. There are about 30 islands in the Riouw group, the largest, Bintang, has an area of 400 square miles. Lingga, of the Lingga group, has an area of 320 square miles; Singkep, 204 square miles. The soil of the greater part of the archipelago is fertile, and the whole is well wooded. The principal export is gambir; other exports are pepper, sago, and rice. Tin has been mined and exported for many years. The original inhabitants have nearly all disappeared; the population now is made up of Chinese, Japanese, Javanese, and Kings. Pop. about 78,000.

Rip-rap, a common name applied to broken stones used for beds, walls and foundation in building and construction. See MASONRY.

Rip Van Winkle, *rip vãn wîng'kl*, a character in one of Washington Irving's legends of the Hudson Valley. While hunting among the mountains he falls in with the reputed followers of Hendrik Hudson and by drinking the liquor they offer him is cast into a sleep of 20 years. When he awakes and returns to the village of Laughing Water, he finds all things changed, but is chiefly relieved to discover that his wife, the irritating obstacle to his easy-going life is no longer alive. The story has been dramatized by Joseph Jefferson (q.v.), and forms one of the important roles in his repertory.

Riparian Rights are those of one who owns the land bounding upon a water course; such owner is the proprietor of that portion of the bed of a river which adjoins his land; such rights upon navigable waters depend largely upon statute and customs of the different jurisdictions. A riparian owner has the right of access to navigable water, and for that purpose to erect a wharf or pier, provided it does not encroach upon the navigable waters sufficiently to interfere therewith. A riparian owner has also a right to the accretions of the soil and to fish in the adjacent waters; he has also the right to have the stream flow naturally without changing it in quantity or otherwise. Such owner is not entitled to the water, but merely to its use, and is without the right to divert, obstruct or corrupt the stream, except to build such lawful obstructions as may be necessary for bridges, wharves and dams. Riparian rights of property are established property, of which the owner cannot be deprived except by due process of law. (See RIVERS.)

Ripley, *rip'li*, **Eleazar Wheelock**, American soldier: b. Hanover, N. H., 15 April 1782; d. West Feliciana, La., 2 March 1839. He was graduated from Dartmouth College in 1800, engaged in law practice and in 1811 settled at Portland, Maine. In 1810-11 he was a member of the Massachusetts legislature, served as speaker in the latter year and in 1812 was elected State senator. At the outbreak of the War of 1812 he entered the army, became brigadier-general in 1814, and for services at Niagara, Chippewa, and Erie was voted a gold medal

by Congress. He remained in the army until 1820 when he removed to Louisiana and resumed the practice of law. He afterward served in the State senate and was a member of Congress from 1835 until his death.

Ripley, George, American author: b. Greenfield, Mass., 3 Oct. 1802; d. New York 4 July 1880. He was graduated at Harvard in 1823, studied theology at Cambridge and in 1826 was ordained a Unitarian minister in Boston. He became interested in the principles of Fourier, Comte, and St. Simon, and made translations of the writings of modern German and French philosophers and endeavored to introduce their ideas in America. He collaborated with Dr. Hodge on a large work in 14 volumes, 'Specimens of Foreign Standard Literature' (1838-42). His 'Discourses on the Philosophy of Religion' (1839) gave rise to a long and bitter controversy with Professor Andrews Norton of Cambridge. He was a leader in the Transcendental Movement originating in 1836 in association with Emerson and others, wrote frequently for 'The Dial,' the organ of that movement. In 1841 he definitely retired from the ministry and became the prime mover in the communistic enterprise of Brook Farm (q.v.), and in 1844 invested all his small fortune in that settlement in West Roxbury. After the burning of the phalanstery in 1846 and the dispersion of the colony, he went to New York as literary editor of the *Tribune*; contributed also to the literary department of 'Harper's Monthly.' With Bayard Taylor he edited a 'Handbook of Literature and Fine Arts' (1852), and in 1858, with Charles A. Dana (q.v.), began the editing of 'Appleton's New American Cyclopedia.' Consult: Frothingham, 'George Ripley' (1882); Swift, 'Brook Farm' (1900).

Ripley, James Wolfe, American soldier: b. Windham, Conn., 10 Dec. 1794; d. Hartford, Conn., 16 March 1870. He was graduated from West Point in 1814, served in the second war with Great Britain, his first engagement being in the defense of Sackett's Harbor. In 1818 he was promoted lieutenant, fought in the Seminole war and was appointed commissioner to establish the boundary line of the Florida reservation in 1823-4. He was captain in command of Charleston Harbor at the time of the Nullification troubles in 1832-3 and in 1841-54 was superintendent of the Springfield Armory. He was brevetted lieutenant-colonel in 1848 for services in the Mexican War, receiving full rank in 1854. He was promoted brigadier-general in 1861, and after 1863 was inspector of fortifications on the coast of New England. He was brevetted major-general in 1865.

Ripley, William Zebina, American educator and economist: b. Medford, Mass., 1867. He was graduated from the Massachusetts Institute of Technology in 1890, made a specialty of economics and in 1893 became lecturer at Columbia. In 1895-1901 he was professor of economics at the Massachusetts Institute of Technology and since 1901 has occupied that chair at Harvard. He has published: 'Financial History of Virginia' (1893); 'The Races of Europe' (1899); etc.

Ripley, Ohio, village in Brown County, on the Ohio River, and on the Chesapeake & Ohio railroad; 45 miles southeast of Cincinnati. It

was founded about the time of the War of 1812, and was at first called Staunton; later its name was changed in honor of General Ripley, an officer in the war. For a time the county courts were held here, but the county-seat was finally moved to Georgetown. The first station on the "underground railway" for runaway slaves was located in Ripley. It is in a noted tobacco region, and has a number of tobacco packing houses and factories; its other industrial establishments include a piano factory and shoe factories, and it carries on a considerable river trade. Pop. (1890) 2,483; (1900) 2,248.

Ripon, rip'ŏn, England, a cathedral city in the county of York (West Riding), on the Ure, 22 miles by rail northwest of York. The cathedral of Saints Peter and Wilfrid, restored 1862-76, is one of the finest churches in England; length, east to west, 266 feet; width of transept, 132 feet; the three towers 120 feet high, were crowned by spires prior to 1660. The city has also other fine ecclesiastical, municipal, and benevolent institutions. The principal manufactures are machinery, saddle-trees, leather, and varnish. The abbey of Ripon was founded in the 7th century, and the Saxon crypt of the cathedral was probably built by Wilfrid in 674-678. The see of Ripon was established in 1836. Pop. (1901) 8,225.

Ripon, Wis., city in Fond du Lac County; on Silver Creek, an inlet of Green Bay, and on the Chicago & N., the Chicago, M. & St. P. R.R.'s; about 85 miles northwest of Milwaukee, and 18 miles west by north of Fond du Lac.

Ripon was settled in 1844 by the "Wisconsin Phalanx" (q.v.) an organization of 19 members, founded at Southport, Wis. The "Phalanx" was based upon Fourier's principles, but only the best of Fourier's rules were followed; free-love ideas never gained a foothold here. The advantages for farming in the rich Ceresco Valley caused the "Phalanx" to locate in what is now Ripon and the surrounding lands. The name they gave to the valley, Ceres, the goddess of grain, and Co., company, making Ceresco, shows that agriculture was of first interest. The city was named Ripon by John Homer, whose ancestors had lived in Ripon, England. The "Phalanx" prospered and held together as an organization for six years. The reports of gold in California was one of the causes of unrest which led to the voluntary and peaceable disbanding of the organization in 1850. The enterprise had prospered so well that at the final division eight per cent above par was paid on the stock. The city was incorporated in 1849 and chartered in 1858. Ripon claims to be the birthplace of the Republican party, and one of the historic buildings is pointed out as the place where the first meetings were held and where the party received its name. The chief industrial wealth of the city is connected with the products of the rich farms of the valley. Grain, fruit and vegetables are abundant, and the dairy products are of considerable value. The chief manufacturing establishments are knitting works, in which there are 200 employees; glove factory, 50 employees; carriage works, 50; machine shops, 20; and pickling works, creameries, box and crate factories, and flour and feed mills. There are 10 churches, and a number of fine business blocks. The educa-

tional institutions are Ripon College, organized in 1851, a high school, graded elementary schools, and a free public library. The two banks have a combined capital of \$175,000. The government is vested in a mayor and a council of eight members, who hold office two years, four of whom are elected each year. Ripon is a favorite summer resort on account of its climate, beautiful scenery, and the attractive drives to nearby points of interest. Pop. (1890) 3,358; (1900) 3,818. The population doing business in Ripon is about 7,000.

C. H. ELLSWORTH,
Editor 'The Ripon Commonwealth.'

Ripon College, located at Ripon, Wis., organized in 1853. Though the Congregationalists have contributed largely to its support and prosperity, it is not under denominational control. Its organization includes a collegiate department, a preparatory department, and departments of music and of art; normal courses are also given. In 1901 the group system of elective studies was adopted and a new professorship in history and economics established; the collegiate courses are arranged in three general groups, classical, literary and scientific, but only the one degree of A.B. is conferred. Women are admitted to all departments. The campus includes 10 acres; the grounds and buildings in 1903 were valued at \$196,300; the library contained 11,000 volumes, and the annual income was \$40,000. The students for the year 1903-4 numbered 150, and the faculty 14.

Ripple-mark, a furrowed or wavy surface often caused on sand by the motion of water or the action of wind, or by their combined agency. Such marks are seen on sandstone of all ages, where they are considered to have been produced by the ripple of the tide on what was once the sandy shore of an ancient sea. Beach ripple may generally be distinguished from ripples due to currents by the frequent changes which occur in its direction.

Rise of the Dutch Republic, The, a historical work by John Lothrop Motley, first published in 1856. It proved an immediate popular success; and was followed by a French translation (supervised with an introduction by Guizot) in 1859, and soon after by Dutch, German, and Russian translations.

Rishis, rī'shīs or r'shīs, sages of the Hindu mythology, sprung from the mind of Brahma, and attendants in alternate months on the sun. Seven of them are enumerated. The Rishis were also inspired sages, of whom the Vishnu Purana enumerates three kinds—royal rishis, or princes, who have adopted a life of devotion; divine rishis, who are both sages and demigods; and Brahman rishis, or sons of Brahma. Rishi afterward came to be applied to all personages distinguished for piety and wisdom.

Risley, riz'li, **Richard Voorhees**, American novelist: b. New York 8 Nov. 1874; d. there 30 March 1904. He was educated in military and other schools and spent several years in foreign travel. He has published: 'The Sentimental Vikings' (1897); 'Men's Tragedies' (1899); 'The Sledge' (1900); 'The Anvil.'

Ristori, rēs-tō'rē, **Adelaide**, Italian actress: b. Cividale, Italy, 29 Jan. 1822; d. Rome, 9 Oct. 1906. She appeared on the stage as a child, and her early parts were in Soldoni's

comedies. After her marriage in 1846 to the Marchese Giuliano del Grillo she retired from the stage for a time, but after her return she devoted herself thenceforth to tragic roles. In 1855 she appeared in Paris in Silvio Pellico's tragedy of 'Francesca da Rimini' and achieved a great success. Her engagement there was followed by a tour of Europe and from that time she was frequently seen in the large cities of the Continent and Great Britain. She made her first appearance in America at the Lyric Theatre, New York, 20 Sept. 1866, and her tour of the United States lasted for eight months. In 1869 she played in South American cities and in 1874 made a journey round the world. She made her fourth and last visit to the United States in 1884 and during that tour which ended in May of the following year appeared as Lady Macbeth in company with Edwin Booth. After 1885 she did not appear on the stage. Her greatest parts were Mary Stuart, Myrrha, Medea, Phædra, Lady Macbeth and Queen Elizabeth.

Ritchie, rich'i, **Anna Cora Ogden Mowatt**, American actress and author: b. Bordeaux 1819; d. Henley-on-Thames, near London, England, 28 July 1870. She was successful as a playwright and dramatic reader, and in 1845-54 appeared with much favor on the stage in both the United States and England, where she was seen with E. L. Davenport (q.v.). Some of her books were published under the pseudonyms of 'Isabel,' and 'Helen Berkley.' They include: 'The Fortune-Hunter' (1842); 'The Mute Singer,' 'Fashion,' a comedy (1847), which was very popular; 'Evelyn' (1845); 'The Autobiography of an Actress' (1854), the best-known and most popular of her productions; 'Mimic Life' (1855); 'Fairy Fingers' (1865); 'The Clergyman's Wife' (1867).

Ritchie, Anne Isabella Thackeray, English author: b. London 1837. She is the eldest daughter of William Makepeace Thackeray (q.v.) and was educated at Paris and Kensington and in 1877 was married to Richmond Ritchie. Her first literary work was published in the 'Cornhill Magazine' while her father edited that periodical. In 1863 she published 'The Story of Elizabeth' which met with success. Since that time she has published fiction, biography and literary reminiscences, among which may be named: 'The Village on the Cliff' (1865); 'To Esther, and Other Sketches' (1869); 'Old Kensington' (1873); 'Toilers and Spinners' (1873); 'Bluebeard's Keys' (1874); 'Miss Angel' (1875); 'Anne Evans' (1880); 'Madame de Sévigné' (1881); 'A Book of Sibyls' (1883); 'Mrs. Dymond' (1885); 'Records of Tennyson, Ruskin and Browning' (1892). The biographical edition of Thackeray's works was edited by her, and her prefaces and notes contain a partial substitute for an authoritative biography against which Thackeray left a prohibition. Her 'Chapters from Some Unwritten Memoirs' (1895) is a work of autobiographical character.

Rite, in religious use, any external sign or action employed as an expression of reverence or devotion, or as a means of exciting internal religious sentiments. The ancient religion of Judaism abounded in rites and ceremonies, and the sect or school of the Pharisees appears to have laid more stress on compliance with these

RITES — RITTENHOUSE

observances than on the weighty injunctions of the law. Jesus Christ repeatedly expressed contempt for the scruples of the Pharisees, and many of those who aim to walk strictly in his footprints repudiate everything like ceremonialism in divine worship. But the vast numerical majority of Christians demand a more or less stately and impressive ceremonial. Rite is used also to express the sum of the ceremonial employed in the administration of the sacraments, as, the "rite" of baptism, the "rite" of confirmation, "the last rites"; again, the entire liturgical ceremonial of a particular branch of the church is spoken of as a "rite," for example, Latin rite, Greek rite, Syrian rite, etc.

Rites, Congregation of, a commission or standing committee of cardinals of the Roman Catholic Church, instituted in the 16th century by Sixtus V. Its function is to exercise supervision throughout the entire church over all ecclesiastical rites and ceremonies, in particular those belonging to the Mass, with a view to prevent the introduction of novelties without express approval, and to maintain unaltered the usages sanctioned by the tradition of the Fathers and the prescriptions of the rubrics. It is the Congregation of Rites that takes cognizance of all matters concerned with the beatification and canonization of deceased servants of God.

Ritschl, ritsh'l, Albrecht, German theologian: b. Berlin 25 March 1822; d. Göttingen 20 March 1889. He studied in the universities of Bonn, Halle, Heidelberg, and Tübingen, qualified at Bonn as a lecturer in 1846, became extraordinary professor of theology there in 1852, and ordinary professor in 1859. In 1864 he accepted a call to the corresponding chair at Göttingen. From 1874 he was a consistorial councillor. In his early thesis, 'Das Evangelium Marcions und das kanonische Evangelium des Lukas' (1846), he adopted the position of his master, F. C. Baur, but in the first edition (1850) of his 'Entstehung der altkatholischen Kirche' ('Origin of the Early Catholic Church') he showed signs of divergence, and the publication of the second edition of the latter work in 1857 marked his complete severance from the Tübingen school. His chief subsequent works are: 'De Ira Dei' (1859); 'Die christliche Lehre von der Rechtfertigung und der Versöhnung' ('The Christian Doctrine of Justification and the Atonement,' 3 vols. 1870-74; 3d ed. 1888-9), his chief work; 'Schleiermachers Reden über die Religion und ihre Nachwirkungen auf die evangelische Kirche Deutschlands' (1874); 'Die christliche Vollkommenheit' ('Christian Perfection,' 1874); 'Unterricht in der christlichen Religion' (1875; 5th ed. 1895), a succinct statement of his theological position; 'Geschichte des Pietismus' (1880-6); 'Theologie und Metaphysik' (1881); 'Drei akademische Reden' (1887); 'Fides Implicita' (1890); and 'Gesammelte Aufsätze' ('Collected Essays,' 1893 and 1896). Ritschl founded a school of theology still of much importance both in Germany and in other countries. Starting from a subjective theory of cognition, based upon the philosophy of Kant as developed in Lotze, he sought to eliminate the whole metaphysical element from religion. He was thus led to reject such doctrines as original sin, the Trinity, the incarnation, whether historic or mys-

tical, and the whole of natural theology, as of no religious value, and he denied the preexistence and miraculous birth of Jesus. He laid stress upon the historical character of Christianity, but held free views of inspiration, and admitted the most advanced criticism. His view of the atonement was essentially the same as the "moral influence" theory of liberal theologians. See the 'Life' by his son Otto (1892-6); Pfeiderer, 'The Development of Theology in Germany since Kant' (1890; German ed., enlarged, 1891); 'Die Ritschlsche Theologie kritisch beleuchtet' (1891); and Schon, 'Les Origines historiques de la Théologie de Ritschl' (1893).

Ritschl, Friedrich Wilhelm, German classical scholar: b. Thuringia 6 April 1806; d. Leipsic 9 Nov. 1876. He was educated at Leipsic and Halle, where he devoted himself to classical studies, and in 1832 was appointed extraordinary professor at Halle. He subsequently held professorships at Breslau and Bonn, and in 1865 accepted a call to Leipsic, where he remained until his death. His chief work is a critical edition of Plautus' Comedies (1848-54, incomplete; entirely remodeled edition, 1881-94). His other works include 'Parerga Plautina et Terentiana' (1845); 'Priscæ Latinitatis Monumenta Epigraphica' (1864); 'Opuscula Philologica.'

Rit'son, Joseph, English antiquarian: b. Stockton-on-Tees, England, 2 Oct. 1752; d. London 23 Sept. 1803. He studied law, became conveyancer in London and deputy high bailiff to the duchy of Lancaster. For many years he devoted his time to antiquarian researches and the editing of rare books, and he assisted Sir Walter Scott in preparing his work on the Border Minstrelsy. His works include: 'Observations on War-ton's History of English Poetry' (1782); 'Ancient Songs from the Time of King Henry II. to the Revolution' (1790); 'Ancient English Metrical Romances' (1802); etc. Consult: 'Letters of Joseph Ritson, with a Memoir by Sir Harris Nicolas' (1833).

Rittenhouse, rit'n-hows, Benjamin, American surveyor: b. Norriton Township, now Montgomery County, Pa., about 1740; d. Philadelphia 31 Aug. 1825. From 1776 to 1778 he was superintendent of a gun factory, maintained by the State of Pennsylvania. He sat in the Assembly of Pennsylvania from 1784 to 1788 and was appointed commissioner to survey the Schuylkill River in 1789. In 1792 he became associate judge of the court of common pleas of Montgomery County. His surveyor's chain made by order of Congress in 1796 has been the standard of the United States land office ever since. He was a brother of David Rittenhouse (q.v.).

Rittenhouse, David, American astronomer and mathematician: b. Germantown, Pa., 2 April 1732; d. Philadelphia 26 June 1796. His great-grandfather, Willem Rittinghuysen, a Mennonite, emigrated from Arnheim, in Holland, in 1688, and set up, on the banks of the Wissahickon Creek, the first paper mill in America. His mother, Elizabeth Williams, was from a Welsh Quaker family. When David was a small boy, the family moved to a farm in Montgomery County, and he lived the usual life of a country lad. From an uncle he inherited, when about 12, some books on calculation and geometry, and henceforth his life was determined. Mathematics and computation be-

came the passion of the boy and the absorbing interest of the man. To these should be added a great facility in mechanical invention and execution. In his teens he began to make clocks of wood and metal, and his father set him up in the business of maker of mathematical instruments and clocks. He is said to have independently discovered the method of fluxions or the calculus when but 19, and to have foreseen its vast utility, before he heard of the claims of Leibnitz and Newton. A friend, Rev. Thomas Barton, furnished him with linguistic and scientific works and his intense assiduity made him a scholar.

In 1763 his fame as an accurate worker in science gave him his first public employment. He was appointed to lay out on the ground the 12-mile radius around Newcastle, which forms the boundary between Pennsylvania and Delaware. This he did most accurately with instruments of his own construction, and Mason and Dixon accepted his results as final. In 1769 he located the point where the 41st parallel of latitude, the boundary between Pennsylvania and New York, strikes the Delaware River. His scientific activities were incessant. In 1769 occurred the transit of Venus, then supposed to be the most reliable means of determining the distance to the sun. Rittenhouse had read a paper before the American Philosophical Society, with computations of the time of ingress and egress, and the Pennsylvania legislature had appropriated £200 toward the observations. He built an observatory near his home in Norriton, and, in company with a committee appointed by the Society, made the most exquisite preparations for the occasion. Everything came off beautifully, and after it was over he fainted. His results were the best obtained in the world, and the computed parallax of the sun the most accurate then known.

He invented the plan of placing spider lines in the focus of his telescope, an arrangement that has done more to make accurate measurements possible than almost anything else of the kind. In 1770 he completed his famous orrery based on computations of his own. This showed the movements of the planets and moons in elliptic orbits around their primaries, the phenomena of eclipses, and the relative places of the members of the solar system over a time of 5,000 years preceding or following. For this he received £300 from Princeton University, and a like sum from the legislature of Pennsylvania as a testimonial to his genius for a second orrery for the University of Pennsylvania. The first one was injured by the British troops in the Revolutionary War.

Then followed computations of the orbits of comets, surveys of the land between the Delaware and Susquehanna for canal purposes, calculations for almanacs, surveys for a series of dams to make the Schuylkill River navigable, and various papers on astronomy for the Philosophical Society. His fame extended to Europe and many honors came to him, while he was looked upon with profound respect and pride by his countrymen who could appreciate his work. He was most modest and simple in his tastes, and if his life could have been spent in the pursuit of science, it was fondly believed that the American Newton had been found. But he conceived that his country called for

service in another field. He was engineer and finally president of the Committee of Safety of his state during the Revolutionary War, and plunged into military problems with all his energy. In 1776 he was made a member of the Assembly of Pennsylvania, the earliest under the reorganized Revolutionary movement, and was active in the creation of the new constitution, the first for the State of Pennsylvania. No one took a more prominent part than he. In 1777 and for 12 successive years, he was elected state treasurer. He was also trustee of the Loan Office. Throughout the war his time was taken up with administrative duties which he disliked, but faithfully performed.

After the war, about five years were expended in determining the boundaries of Pennsylvania. The five degrees along Mason and Dixon's line were ascertained by observations on Jupiter's satellites at each end with instruments made by himself. He was also engaged in running the western and northern boundaries of his State, and at the appointment of Congress, in 1787, the line between New York and Massachusetts. From 1779 to 1782 he was professor of astronomy in the University of Pennsylvania and afterward trustee and vice-provost of that institution. In 1792 he was made director of the United States mint by President Washington. After three years of service, he resigned and returned to scientific work. He succeeded Franklin as president of the American Philosophical Society in 1790. Degrees were conferred upon him by the University of Pennsylvania, by Princeton and by William and Mary, and the Royal Society of London made him an honorary member. "We have supposed," said Thomas Jefferson, "Rittenhouse second to no astronomer living; that in genius he must be the first because he is self-taught."

He was an ardent Republican. He allied himself with the strong Revolutionary party and with the anti-Federalists after the war. He was president of a society organized to sympathize with the French Revolution and was a loyal member of the party which later under Jefferson introduced the extreme democracy of the reactionary period which followed Federalism. Whether he was in fault or not in his political affiliations will be differently judged, but posterity can unite in admiration for the self-educated scientist of the highest type and for the lovable, honorable, sincere gentleman.

His publications, about 20 in number, appeared in the Transactions of the American Philosophical Society. The most popular was an Oration on Astronomy. An interesting 'Eulogium' was delivered after his death by Dr. Benjamin Rush. His life was written by his nephew, William Barton, in 1813, and by James Renwick in Sparks' American Biography. A discriminating account of him, by S. W. Penny-packer, was issued in 1882.

ISAAC SHARPLESS,
President Haverford College.

Ritter, rīt'èr, Frederic Louis, American musician and composer: b. Strasburg, Alsace, 22 June 1834; d. Antwerp, Belgium, 6 July 1891. He studied music at Paris with Georges Kastner, taught at the seminary at Fénétrange, Lorraine, and in 1856 came to America and settled at Cincinnati. Here he organized the Cecilia

(choral) and Philharmonic (orchestral) societies. Removing to New York in 1861 he became the conductor of the Sacred Harmonic and the Arion Choral Societies. The first musical festival of note held in New York was given under his direction in 1867. That year he assumed the duties of the professorship of music at Vassar College, which position he held until his death. He was a prolific composer of vocal music such as solos and choruses, among which were musical settings for several Psalms, 'O Salutaris,' an 'Ave Maria,' a group of Persian songs, and more than 100 German lieder. He also wrote works for orchestra and piano-forte and was the author of 'A History of Music in the Form of Lectures' (1870-4); 'Music in England' (1883); 'Music in America' (1883); 'Manual of Musical History' (1886); and 'Musical Dictation' (1888).

Ritter, Heinrich, hin'rin rit'tér, German philosopher: b. Zerbst in Anhalt, 21 Nov. 1791; d. Göttingen 3 Feb. 1869. He studied at Halle, Göttingen and Berlin from 1811 to 1815, and in the last named year the calling out of the volunteers led him to France. On his return he devoted himself exclusively to philosophy, especially in the department of history, in which he adopted the method and critical views of Schleiermacher. He qualified himself at Berlin as a university teacher, and from 1824 held an extraordinary professorship in that city until he accepted a call to Kiel in 1833, whence in 1837 he removed to Göttingen, where he continued to occupy the university chair of philosophy till his death. Ritter's best works belong to the history of philosophy, his first in this department being an investigation into the doctrines of Empedocles in Wolf's 'Literarische Analekten' (1820). His 'History of Ionian Philosophy' (1821); 'History of the Pythagorean Philosophy' (1826), and 'Notes on the Philosophy of the Megarean School' in the Rheinisches Museum, are models of historical investigation on the principles of Schleiermacher. His historical masterpiece is the 'History of Philosophy' (1829-53), which deals with general history up to the time of Kant. It was supplemented by a 'Review of the History of German Philosophy from the Time of Kant' (1853).

Ritter, Karl, German geographer: b. Quedlinburg, Prussian Saxony, 7 Aug. 1779; d. Berlin 29 Sept. 1859. He was educated at Halle, resided for a considerable time at Göttingen, in order to avail himself of its library, in 1819 succeeded Schlosser as professor of history at the Frankfurt Gymnasium, and in 1820 became professor extraordinary of geography at the University of Berlin, an office which he held with distinguished reputation for nearly 40 years. With Ritter may be said to have commenced a new epoch in geographical science; and a new department, that of comparative geography, claims him as its founder. His great work is 'Die Erdkunde im Verhältnisse zur Natur und Geschichte des Menschen' ('Geography in its Relations to Man's Nature and History'), the first two volumes of which appeared at Berlin in 1817-8, although it was afterward continued on a more extended plan, yet it was left incomplete, covering only Africa and Asia. It constitutes, so far as it extends, 19 vols. (1822-59), a vast repertory of valuable information rel-

ative to physical and general geography. Among other productions of Ritter may be mentioned 'Europa, ein geographisch-historisch-statistisches Gemälde' ('Europe Delineated Geographically, Historically, and Statistically,' 1807), and 'Die Stupas, oder die architektonischen Denkmäler an der indobaktrischen Königstrasse und die Kolosse von Bamyán' ('The Stupas, or Architectural Monuments on the Indo-Bactrian Highway and the Colossi of Bamyán,' 1838).

Ritual, in ecclesiastical usage, a manual containing the forms to be used by the priest in administering the sacraments, namely the communion (when given outside of the Mass), baptism, absolution, marriage and extreme unction; also in such rites as the churching of women, burial of the dead, blessing articles for religious uses, as water, candles, etc. The Roman Ritual now in universal use in the Latin Church was drawn up by order of Paul V., who, 1614, "counseled" all prelates to conform to its prescriptions exactly; but though the pope only counseled (*hortatur* is the word he employs in the bull *Apostolica Sedi*, a decree of the Congregation of Rites (1850) declares that the forms of the *Rituale Romanum* "affect the universal church." Before the issuance of the bull of Paul V. there were various ritual manuals authoritative in different countries or different episcopal jurisdictions. In the Eastern churches generally, as in the Greek Schismatical Church, the Ritual forms part of the general service book, the Euchologion, which corresponds to the Missal, the Pontifical and the Ritual of the Latin Church. The ritual of the Anglican Church is contained in the Prayer Book under the heads "Ministration of Baptism," "Order of Confirmation," etc.

Ritual of the Dead, one of the service books of the Roman Catholic Church in which are contained the prayers and the order of ceremonial used by that church in the administration of the sacrament and in certain other offices. The ritual occupies much the same position to the priest as the *Pontificale* does to the bishop. These directions are contained, in the case of the Anglican Church, in the Book of Common Prayer; in the Greek and some of the other Eastern churches the ritual is a part of the general collection. The Roman Catholic ritual now in use was made under the direction of the Council of Trent (Dec. 1545 to Dec. 1563), the need being felt for a unified ritual, to replace the various versions then in use. In 1614 Paul V. published an authoritative edition. This was often reprinted, and was revised and reissued by Benedict XIV. See BOOK OF THE DEAD.

Ritual Law, that portion of the law of Moses which prescribes the ceremonies of public religious worship, the manner of making trespass offerings, the procedure for the discovery of leprosy, for the purification of women after childbirth, the discrimination of things clean and unclean, etc. The ritual laws of the Hebrews are contained mostly in the books Exodus, Leviticus, Numbers and Deuteronomy.

Ritualism, a term designating the practices of a party in the Church of England and the Episcopal Church in the United States and elsewhere, in surrounding the public worship with a variety of rites and ceremonies, and in

resuscitating certain features and usages of the Catholic Church in pre-Reformation times, such as the use of ornate eucharistic vestments, use of the sign of the cross, belief in the "Real Presence," prayers for the dead, treating the communion service as a real sacrifice, auricular confession, and many other beliefs and practices usually esteemed by Protestants as the insignia of "Romanism." By many, ritualism is held to be only another name for Puseyism and Tractarianism; but Dr. Pusey, at least, the reputed father of Puseyism, never adopted any of the practices of ritualism. The Ritualists defend their position against the charge that it is nothing but a revival of "Romanism" in the Protestant Church and that it is flagrantly inconsistent with the simplicity of Christian worship as portrayed in the books of the New Testament, by saying—what is undoubtedly true—that not all authoritative regulation of ritual is laid down in the New Testament, and that what is obligatory in ritual is to be learned from apostolic tradition. They allege, in explanation of the simplicity of primitive Christian worship, the secrecy and restraint to which the church was subjected through the ages of the persecution. All through that time the apostolic tradition was preserved by the church: on the accession of Constantine the ritual of the church assumed its natural beauty and proportions. And they cite the Anglican Book of Common Prayer in its original form as promulgated in the second year of Edward VI. (1549) as authorizing most of the practices now condemned by Protestants as ritualistic and "Romish." Their contention that the Episcopal Church of England, with its daughter churches, is historically committed to the practices for which the Ritualists are censured, need not be considered here: it will suffice briefly to state some of the peculiar rites and usages which distinguish the Ritualists from the mass of Protestants whether in the Episcopal or other churches. The Ritualists hold that the "altar" is a necessary part of Christian worship: the Book of Common Prayer, in the "order for the administration of the Lord's Supper," carefully avoids the word "altar" and says always "table." The Ritualists revived the practice of auricular confession and set up in their churches confession-boxes as in Roman Catholic churches. They brought back into use the eucharistic vestments—dalmatic, chasuble, cope, etc. The Puritans held the cross an abomination: the Ritualists set it on top of their churches and in the centre of the altar—and not only the cross but the crucifix. They restored also the use of incense in divine worship; and at the celebration of "the Mass" as they do not hesitate to call what in the Prayer Book is "the Lord's Supper" or "Holy Communion," they keep candles burning, as in Roman Catholic churches, even though the sun may be at meridian. And, what is more significant still, the Ritualists pay formal adoration to the "Real Presence" of Christ's body and blood, believed to underlie the species of bread and wine.

Ritualist, one who is zealous for strict observance of ritual; in particular, one who advocates the use of the rites of Catholic worship in the Established Church of England or in the Episcopal churches which derive from the Church of England. See RITUALISM.

Rivarol, Antoine, ăntwăn rê-vă-rôl, French satirical and political writer: b. Bagnols, 26 June 1753; d. Berlin 11 April 1801. He was one of the celebrated wits of the 18th century, possessing distinction, elegance and an astonishing facility in the expression of his thoughts that early gave him a position in the salons and at the court of Paris. His first work, which obtained a prize at the Academy of Berlin, was 'Discours sur l'Universalité de la Langue Française' (1784). The same year he published a translation of Dante's 'Inferno.' Later appeared 'Lettres à M. Necker' and in collaboration with Champcenez, 'Petit Almanach des grands Hommes' (1788), a satire on the authors of his day. Becoming an émigré in 1792, he lived at Brussels, London, Hamburg and finally at Berlin, his works at this period being 'Lettres au Duc de Brunswick'; 'Lettre à la Noblesse Française' (1792); 'Vie politique et privée du Général La Fayette' (1792); also a preliminary discourse to a French dictionary (1797). In 1828 was published under his name a dictionary of the French language which was not written by him. His collected works were edited by Chénedollé and Fayolle in 1808.

Rivas, rê-vās, Nicaragua, a town between Lake Nicaragua and the Pacific Ocean, slightly northwest of the surveyed route of the Nicaragua Canal, and on the high road to Granada. It occupies the site of a Nicaraos Indian village. Pop. 6,000.

Rivé-King, rê-va'king, Julie, American concert pianist: b. Cincinnati, Ohio, 31 Oct. 1859. She is the daughter of Léon and Caroline Rivé, the latter a musician and her first teacher, and was married in 1878 to F. H. King. She appeared first in concerts at the age of six. Later she was a pupil of Liszt. She has appeared in over 200 concerts with Theodore Thomas and 80 with Seidl, besides in many independent recitals. She ranks among the foremost solo-pianists in America.

River Dolphins. See PORPOISE.

River Falls, Wis., city in Pierce County; on the Kinnickinnick River, and on the Chicago & Northwestern; about 60 miles in direct line west of Eau Claire and about six miles from the Mississippi River. It was settled in 1850 by a colony from New York, incorporated in 1856 and chartered as a city in 1885. It is in a productive agricultural region, in which wheat is the principal crop. The chief manufacturing establishments are flour mills, wagon works, and starch factory. The trade is mostly in grain, flour, and vegetables. The principal public buildings are the six churches and the schools. River Falls is the seat of a State normal school, and a high school, and has two graded schools. The bank has a capital of \$25,000. The government is vested in a mayor, elected biennially, and a council of six members elected annually. The city owns and operates the waterworks, and the electric light plant. Pop. (1890) 1,783; (1900) 4,503.

River-hog, one of the African wild swine of the genus *Potamocharus*, separated from the typical pigs (*Sus*) by the existence of a horny outgrowth from a bony protuberance above the canine in the male. This has been compared by Beddard to the osseous horn-cores of the extinct *Dinoccrata*. Five species are recognized, one in

RIVER-TERRACE — RIVERS

Madagascar, and the others in South and West Africa. The best known are the gray bush-bark or bush-pig (*P. africanus*) of Cape Colony, and the red river-hog (*P. porcus*) of the West Coast, remarkable for its vivid rufous coloring and long penciled ears. These pigs lead a half-aquatic life along the marshy borders of sluggish streams and in dense forests, but do great damage to the native plantations in some parts of the country, whence they are constantly killed off. Consult 'Proceedings' Zool. Soc. London, 1894, p. 92.

River-terrace. See TERRACE.

Rivera, José Fructuoso, hō-sā' frook-too-ō'sō rē-vā-rā, Uruguayan soldier and politician: b. Paysandu, Uruguay, 1790; d. Montevideo, Uruguay, 13 Jan. 1854. He fought in the numerous civil wars, rose to leadership, and when Uruguay established her independence became in 1830 first president of the republic. In 1835 he was succeeded by Oribe, and in 1836 headed a revolt against the president, which resulted in a civil war of two years' duration. Oribe was forced to resign, and in 1838-42 Rivera again served as president. In the latter year, Oribe, aided by the Buenos Ayres dictator, Rosas, invaded Uruguay, and in 1843 began the famous nine years' siege of Montevideo. Rivera moved to meet him in the field, but in 1845 was defeated at India Muerta by Urquiza, an ally of Oribe. In 1853 Rivera aided Flores in deposing the recently elected president, Giro, and later became a member of the executive triumvirate.

Riv'erhead, N. Y., village, county-seat of Suffolk County; on the Peconic River, at the head of navigation, and on the Long Island railroad; 67 miles east of New York. The village was first settled in 1690, and its growth during the first century was slow; in 1729 it was made the county-seat. During the War of 1812 a skirmish between men from some British vessels and the American militia took place near the village and within the limits of the township. It has a variety of industrial establishments, including grist mills, a woolen mill, planing and molding mills, carriage works, soap factories, and an organ manufactory. It contains the county court-house, the agricultural fair buildings and grounds, and has a high school with a school library. Pop. (1890) 4,010; (1900) 4,503.

Rivers (Fr., *rivière*; Span., *ribera*; It., *riviera*; Lat., *riparius*, from *ripa*, bank, of or belonging to a bank), bodies of water of considerable size flowing with perceptible currents in definite channels, and usually without cessation during the year. Some water courses are designated as rivers although their beds are dry a part of the year. Rivers, obeying the laws of gravity, their waters seek the lowest level and eventually reach the ocean. The regions having rivers which do not flow into the ocean either directly or indirectly are parts of the earth's surface where the evaporation is so great that no overflow of water results from precipitation. Usually the overflow of a river discharges into another river, and perhaps a second or even a third discharge is made before the waters reach the sea. The Republican River of Nebraska and Kansas flows into the Kansas River in the State of Kansas, and the Kansas River

flows into the Missouri, the Missouri into the Mississippi, and the Mississippi into the Gulf of Mexico, which last discharges its waters into the Atlantic Ocean through Florida Strait and Yucatan Channel.

Origin.—Rivers are usually formed by springs or the gradual melting of the ice and snow which perpetually cover the summits of all the most elevated ranges of mountains upon the globe. Springs and ice are themselves due to the precipitation of water from the atmosphere in the form of snow, rain, mist, or dew. These fill the springs, lakes, or other reservoirs from which rivers flow by the natural gravitation of water to a low level. The union of various springs, or of these meltings, forms rivulets; these last follow the declivity of the ground, and commonly fall at different stages into one great channel called a river, which at last discharges its waters into the sea or some great inland lake. A new made river at first usually flows over the surface until it has worn itself a channel; or it may follow some depression or deformity in a mountainous region. Rivers are swollen during their course by the rain which falls on the surface. In temperate climates the source of supply tends to greater equality in the volume of the river than in torrid regions, where the evaporation is great. In the former the rains are not only more equally distributed in point of time, but also from a more protracted source of supply; part of the rainfall sinks into the ground and forms springs, part forms rills which flow directly into the river, and part feeds those rills with the drainage of the saturated ground long after the rain has ceased. As mountainous regions abound in springs, most rivers commence from a chain of mountains; each side of a chain also has its springs, and the rivers which originate on one side flow in the opposite direction to those which rise on the other. As it is the property of water to follow the most precipitous descent that comes in its way, the courses of streams point out the various declivities of the earth's surface, and the line from which large rivers flow in contrary directions generally marks the highest parts of the earth. This line need not, however, be of any great height; in European Russia, for instance, where the rivers are very extensive, the line which separates their sources is very little above the level of the Baltic or of the Black Sea.

Changes in Form and Size.—As soon as the stream begins to flow, its channeling and the deepening of its trough commences. If no obstructions prevented, the water would go on enlarging the channel, by widening and deepening. The nature of the soil, the softness or hardness of the rocks along its course, the amount of sediment it carries in its waters, and where this sediment is deposited all contribute to change of form and size. The erosive action of rivers on their beds is continually exercised, especially in the early part of their course: where the channel broadens as they approach the sea it may almost cease. Remarkable instances of erosive action are almost everywhere to be observed; but in no case is such action more striking than in the cañons or river-gorges in the Colorado region of the United States. There the rivers have hollowed out for themselves channels that present almost perpendicular rock walls on either side rising to the

RIVERS

height of 6,000 feet for hundreds of miles. Such action is also seen where there is a waterfall, in which case the water gradually wears away the rock at the place where the fall occurs, and thus causes the latter to recede, as Niagara Falls. In perhaps every case a river has had much to do with the formation of the valley in which it flows. Rivers are very permanent features in the earth's history, and in some cases have hollowed out a channel through a mountain range gradually elevated across their source.

The size of a river depends upon two main circumstances,—the extent and character of its drainage area, and the degree of humidity possessed by the climate of the region from which it draws its supplies,—the latter being often dependent upon prevalent winds blowing from the ocean. The peculiar position of the Andes Mountains with respect to the rest of South America, the fact that by very far the largest proportion of its running waters are drained off in one general direction, toward the Atlantic, and the humidity of the climate, all contribute to the immense size of the rivers. The Andes being placed so near the coast of the Pacific, the rivers which flow into the Pacific Ocean are small; while those which flow on the other side, having such an immense space to traverse, are increased into a vast volume before they reach the Atlantic. The physical conformations of some continents are unfavorable to the accumulation of such vast bodies of water as the rivers of South America. Europe is not of sufficient extent; Africa has a climate which causes rapid evaporation and abounds in sandy deserts. A large part of Asia has not the humidity of the Amazon region, and its vast interior lakes serve as receivers for some of the large streams. The arrangements of its mountains conduce to long and somewhat narrow drainage areas. As the river goes on from year to year, in most cases it cuts a trench below the original constructional channel, and in time forms what is called a consequent valley. By means of the new constructional troughs many of the constructional lakes and the rivers become continuous streams, that increase the length as well as the depth of the channel. Where the waters pass from a hard to a soft rock, or from a resistant to a weak part of the material through which it is channeling, a greater slope is formed making rapids (q.v.) or falls (q.v.) or cascades (q.v.). The angle of the slope depends upon the difference in the degree of resistance of the hard rock in the old channel as compared with the soft rock in the formation channel. Gradually the channel is cut down close to the sea-level or base-level, and its course is over a gentle, gradual slope. The depth of the channel depends upon the dryness of the climate, softness of the rock, height of the land, and the volume of the stream. The dry climate really lessens the volume of the stream, and consequently it cannot force its way with the rapidity of a stream with greater volume even if the widths of the channels are equal. The river flowing through a region of hard rock will cut a deeper valley in a given time than the river of the same size and volume flowing through a region of soft rock; the latter will have a mass of detritus, an accumulation of waste from the weak rock, and it will need a vast volume of water or a steep

grade to do the same amount of channeling as the first mentioned river. Rivers flowing over comparatively low land, with drainage areas not much above the base-level have shallow channels, as in the southeastern part of the United States, especially in Florida. A river with a large volume of water has more power to carry off sediment, and even where the slope is gentle its momentum is greater than in that of the stream of a small volume of water. There are two causes for the shallow channels of the long rivers of the plains east of the Rocky Mountains; the dryness of the climate and the soft rock material through which they pass.

After a river has cut its channel to the base-line, then its grading really begins, the inequalities gradually disappear, or would disappear if there were no obstructions to the regular work. The constructional lakes and the waterfalls gradually disappear. The constructional lakes may disappear, but if the amount of detritus is large the channels lower down a stream, with a slight grade, may be filled, and thus the water will flow over a bed elevated above what was once its channel. Such channels exist in Ohio and in the plains of Lombardy. Any change in the depression or uplift of the land, whether from volcanic or other causes, will cause some change in the river. In various parts of Europe and the eastern part of North America, rivers have changed because of increase of evaporation, caused by the continued deforestation of their basins. New rivers often appear in the drainage area of a well defined river. There are several causes for this change; the consequent valley formed by the original stream will, in places, have a weak rock-mass through which the water will break and a lateral channel or ravine will be formed. The valleys formed by such streams are called subsequent valleys and the streams themselves are called subsequent streams.

The main stream with all the lateral streams and all tributaries, whether lakes or rivers, is called a river system. The land drained by a river system is called its basin. The system is usually known by the name of the main stream or trunk.

The rate of fall of many of the large rivers is not great. The Amazon has a descent of only $10\frac{1}{2}$ feet in 600 miles of its course—that is, one twenty-seventh part of an inch for every 1,000 feet of that distance. The Loire, in France, between Pouilly and Briare, falls one foot in 7,500 feet, but between Briare and Orleans only one foot in 13,596 feet. Even the rapid Rhine has a descent of no more than four feet in one mile between Schaffhausen and Strasburg, and of two feet between the latter place and the borders of Holland. The glaciers in France show a change in volume, and a consequent change in the size and rate of fall of the glacier-fed rivers. See NIAGARA FALLS; WATERFALLS.

Watersheds or Divides.—The line which separates the waters which flow into different rivers or different systems is called the watershed or the divide. The continental divide in the United States is the line which parts or separates the streams which flow into the Pacific from those which flow into the Gulf of Mexico through the Mississippi. Divides change from various causes. The subsequent rivers sometimes take the water from one system to

RIVERS

another. The gradual removal of a constructional lake may change the divide, as in New York State, between the Mohawk River and Lake Ontario, in the Northwest between the Red River of the North and the Mississippi. The divides in many places are very low, as between the Amazon and Orinoco, and the Amazon and the Paraguay. The Orinoco at some distant period reached the basin of the Amazon, and has been subsequently connected with it through what is now an important branch, the Cassiquiare, which after a course of 120 miles from the main river discharges itself into the Rio Negro, a branch of the Amazon; and as the navigable waters of the Amazon approach within three miles to those of the Paraguay, there is with only this interruption a continuous communication by navigable rivers from the mouth of the Orinoco, in lat. 9° N., to the mouth of the Paraguay, in lat. 35° S.

Flood-Plains.—For various reasons many rivers overflow their banks at annual periods, others at irregular intervals. Such rivers usually carry a large amount of silt which at the time of an overflow is deposited on the land, thus enriching it. Great damage sometimes results from this overflow (see LEVEES; MISSISSIPPI), and various means have been devised to protect the lands adjacent to such rivers from inundation. The flood-plains of the Nile are noted for their fertility; the Mississippi, Amazon, Ganges, and many others have extensive flood-plains. The large rivers of Siberia have vast flood-plains caused by the thaws at the sources of the rivers when the lower portions are closed by ice. The descending waters sweep over the frozen surface carrying with them vast quantities of soil, detritus, and even forests. The Mackenzie in North America has flood-plains from the same sources as the Siberian rivers.

Mouths of Rivers.—The river which enters the ocean may have its channel submerged and the mouth becomes an estuary, or the tidal wave may crowd back its waters and the mouth becomes a fiord. In either case there is a constant battle for supremacy between the fresh water from the land-mass and the salt waters of the sea. Some of the sediment of the rivers is brought to the sea and either carried out into the ocean or deposited at the mouth of the river, where they form deltas. In some cases, as the Mississippi, the delta grows rapidly, extends out into the sea and becomes a part of the land-mass. The sediment annually brought down the Mississippi has been estimated as equal to a deposit of a foot in thickness over 12 square miles. The waters of the Ganges and Brahmaputra come more highly charged with sediment on account of their more rapid descent and the more violent rains that fall about their sources, and their deposits exceed many times those of the Mississippi. The sediments are spread out to a distance of 100 miles or more from the land, the waters of the Bay of Bengal being discolored by them even at this great distance. The quantity annually discharged from the mouth of the river has been computed equal to a layer one foot thick over a tract of 225 square miles. The Nile has a vast delta. The Mississippi, Nile, Ganges, Po, and many other rivers enter the sea by several channels. The Amazon enters by only one large channel, divided by an island, but the river widens out into a bay 180 miles wide. The delta-lands are

very fertile, and where the river channels have assumed stability, deltas have become valuable additions to the land-mass.

Economic Relation of Rivers.—The effect rivers have in supplying moisture to the adjacent lands, either by natural or artificial (irrigation) means is recognized by all nations. Their uses as contributing to the healthfulness of the climate and to modifications of temperature are well known. In the early history of all the nations on the globe, the waterways were the great thoroughfares which furnished means of intercommunication, and the rivers were largely instrumental in determining the location of the great commercial and industrial centres of the world. The great rivers of Europe and Asia, such as the Rhine, Danube, Volga, Indus, Ganges, Brahmaputra, Yangtse, and Ob, afford access to the sea to enormous populations. The Amazon, with its plain track extending for nearly 3,000 miles, is in many ways less like a river than a fresh inland sea; but the Mississippi and Saint Lawrence, though less extensive, are of greater value for carrying sea traffic to inland places. In their upper valley tracts, rivers are of use chiefly for transporting timber and driving machinery. It is interesting to note that in Switzerland, Norway, and Sweden, where there is no coal, there exist exceptional facilities for the use of water power on account of numerous mountain torrents.

LAW OF RIVERS.

General.—In law a body of water having a uniform current is generally termed a river. It consists of the bed, the water, and the banks or shores according as the stream is non-tidal or tidal. The law applicable to rivers and their use depends upon the country having jurisdiction over them. In the United States the use of navigable rivers is regulated by the laws of the United States, and by the legislatures of the States through which they flow. No general statement that is applicable to all streams, and which governs the use of all streams, can be made, and navigable and unnavigable rivers are not always subject to the same rules. In the United States, in the most approved and important sense of the term, navigable waters include all those having a channel which is useful for commerce. Such waters are public highways by common right. It has been said in construing the common law and in some of the earlier decisions of the courts that by navigable waters are meant all those in which there is a flow or re-flow of the tide. This definition may have been proper in England where there is no river of any considerable importance which has not a flow of the tide, but it would be unreasonable, in fact it cannot be applied in the United States where there are large rivers like the Mississippi, the Ohio, the Allegheny, the Delaware, the Hudson, the Schuylkill, the Missouri, the Columbia, and others that are very important for the purposes of navigation, and over which large business interests are transacted. To be navigable rivers, in the legal sense, commerce must be carried on over them which is of a valuable character. It is not necessary, however, that this commerce be carried on by means of boats; waters over which valuable commerce can be carried on are public highways for the purpose, even if they are used only for floating logs and rafts. Most of the authorities in America limit

RIVERS

the term navigable waters to waters having an inherent capacity for navigation. Whether a river is navigable or not is generally a conclusion of fact and can be established by proof; but the courts in some States take judicial notice of the fact that some streams are navigable. In common law a distinction was made between waters navigable in law and those navigable in fact; those navigable in law being tide waters. The term is still used in this sense in England. By the civil law, waters that are in fact navigable are such in law, and a navigable river is defined as a *statio itinere navigio* (a place or way for navigation). In the development of American law the tendency of the courts has been toward the adoption of the civil law doctrines. Among navigable waters are two classes, termed Public and Semi-Public. The basis of classification is ownership. In public waters the soil beneath them is common property. The public have the right of navigation and all rights incident to ownership. Among them are fishing, gathering ice, sea-weed, sand, gravel, etc. All tide waters, including the sea and its arms and tidal rivers, belong to this class, and in many of the States all fresh-water rivers and lakes which have a capacity for valuable floatage are public. The non-tidal waters and the soil under them are private property, although the interest of the owner is qualified by being subject to the right of the public to pass over them.

Jurisdiction.—The right of navigation is subject to the control of the government, and the government has the right to improve rivers and harbors. In England this power was vested in Parliament. In the United States the authority of Congress under the commercial clause of the Constitution is paramount. In the absence of Congressional action, the power of the State legislatures is supreme; they may direct the improvements of navigable rivers, and may authorize improvements by individuals and by private corporations, and may levy tolls. Waters which lie within the borders of different States are generally subject to the concurrent jurisdiction of the States. The territory of States and nations when bounded by rivers, extends, unless otherwise agreed upon, to the centre of the streams.

Public Easement of Passage.—The public have the right of passage over all streams which have a capacity for that purpose, and this includes the right of navigation in boats and vessels, and of floatage as in the case of rafts and logs, and of travel over the ice. In common law the right to navigate waters above the tide was acquired by using the same. Now it may be granted by express act of legislature, but it is generally regarded as an inherent public right needing no legislative sanction. The legislatures of the States having jurisdiction, and Congress may make rivers and streams public highways for particular purposes when they are not public highways or navigable for other purposes. For instance, the Legislature may make a river a public highway for the purpose of floating logs, although it cannot be navigated by boats or vessels.

Use of Banks and Shores.—By the civil law the public have the right to use banks and shores of navigable rivers as appurtenant to the right of passage, and this is true of the States where that system prevails; but under the

common law the right to use the shores and banks by navigators was limited to high water mark and the right to pass over the waters does not include the use of banks for general purposes. But the public have the right of anchoring and of mooring on the banks against all except the owners of the banks. There is no public right at common law of towing on the banks. The owners of stranded property may go upon the banks for the purpose of taking it. In the use of rivers for navigation, the boats going down stream have a right to the centre of the stream or the centre of the current, and those going up stream must keep to the sides in passing. A descending boat may keep to the shore, but if she meets an ascending boat hugging the same shore and signaling her intention of keeping the shore, the boat going down stream must keep to the middle of the river. The rule is for the protection of vessels navigating up and down rivers crowded with boats to hold to the centre as nearly as possible. The rule both of statute and the general laws of navigation, which requires steamboats approaching one another to turn to the right applies to steamboats crossing a river, and ferry-boats crossing rivers making frequent trips, are obliged to use great care to avoid other sailing craft. Steamboats must keep out of the way of barges and flat boats floating down the river guided only by oars.

Rivers not Navigable.—Rights of Owners.—When a river that is not navigable forms the boundary of property, one half usually belongs to one proprietor and the other half to the other, the centre of the stream being the line between the owners of the lands on each side, and when the land on both sides belongs to one owner he is then the owner of the whole bed of the stream. This rule of law refers to the land under the water, and it is the property of the riparian owner as much as the banks of the river. The owner of the land has not an absolute ownership of the water, but he can use it for necessary purposes, as for the use of his family and house and to water his stock. If he takes more than the usual quantity and for such purposes as are not necessary, he is liable for damages to riparian owners farther down the stream in case they suffer damages. One owner of the land cannot change the bed of the stream to the injury of other owners; but if the line be changed slowly by accretion at one side, the line of ownership will still follow the centre of the stream. The rule might be different if, for any unforeseen and uncontrollable cause, the stream should burst its banks and make a new channel in a different place.

Fishing.—Each riparian owner has the right to fish in the waters on his own side of the river, subject to the fishing laws. It is customary, however, for owners of opposite sides of rivers to allow each to fish in the whole stream, for the convenience of both parties. Where the river bed is owned by the public and the river is navigable any person has a right to fish.

Accretions.—The owner of the land along the side of and under a river has the right to all deposits of alluvium along and upon his land. If an island is formed by accretions in an unnavigable stream, the ownership will be determined by the *filum aquae*, or centre of the stream, and it will belong to the parties owning

RIVERS

the land on the side of the line on which it is formed. If the island is on the line, each will own his proportionate share.

Bridges.—Congress has power to authorize the erection of bridges over navigable rivers; the power may be exercised and authority given even when the bridges obstruct to a certain extent the free navigation of the rivers. States also have power to authorize the building of bridges over navigable waters within their boundaries, although they may to a certain extent interfere with navigation. This power in the States, however, is subject to the exercise of the power of Congress to regulate navigation. The proposition has come to be recognized as not disputable that but for the power granted by the Constitution to Congress, the State Legislatures would have as full and entire control of the waters of their several States as they have over the land. The States reserve all power not granted to Congress. The sovereignty over the waters of the States vests in Congress and in the several State Legislatures. Congress and the State Legislatures can provide for the erection and maintenance of draw-bridges over navigable rivers, and provide for the safe passage of vessels in the draws.

Boundaries.—When land along the bank of a river is described as being bounded on the bank or shore instead of the centre of the stream, then low water mark on the shore will usually be the boundary line. Where land is bounded by a common law navigable stream, that is, one in which the tide ebbs and flows, the boundary is the high water mark on the shore, and in some States in which there are large rivers that are navigable, although the tide does not ebb and flow, the boundary line is held to be low water mark. The proprietor has a right subject to government supervision to erect wharves and piers extending to low water mark or into the channel of the stream. In deciding what is low water mark, the ordinary rise and fall of the water is taken into account. There is not a unanimity of legal opinion in all the States upon the subject of the ownership of the beds of streams.

Dams.—The owner of land on both sides of a stream not navigable may erect a dam and swell the water of the stream or form a pond up to the line of the land of the next owner up the stream. An owner of but one bank cannot, without permission, erect a dam beyond the thread of the river. The erection of dams has been encouraged by the legislatures in many of the States on the ground of public policy. The right to erect dams has been given to riparian owners even when they flow the lands above them, and in some cases permission has been given to riparian owners to erect dams across the stream, although they owned land only upon one side. In these cases the statutes authorizing the erection of such dams have provided the method of assessing and collecting damages. Riparian owners on navigable streams, whether navigable by nature, or declared to be public highways by the legislatures of the States through which they flow, cannot erect dams across such streams without permission of the legislature having jurisdiction, or Congress. This permission is granted in some States by general law, and in others, as in New York, by special laws. The legislatures in granting permission to erect dams always

provide for ordinary navigation and for the maintenance of fishways. The right given by legislatures and by Congress to erect dams is not a protection against injuries to private owners. Such owners have a right to collect damages.

Ferries.—A ferry franchise is a right to transport passengers and property across a stream and to land at a particular place on its bank. In the United States this right is established by legislative authority. It is the creature of a sovereign power and no one can exercise it without the consent of the State. It is within the control of the government. In England the right was granted by the Crown, or founded upon prescription. A ferry franchise is real estate and can be sold like any other real estate.

Fishing.—Ordinarily any person may take fish out of navigable streams if he can do so without trespassing upon the lands of private owners. In most of the States of the United States as at common law, the exclusive right to fish is in the owners of the banks of rivers that are not navigable unless otherwise appropriated by statute. This right, however, is subject to legislative control. The preservation of fish in the waters of a State is of such public concern as to fall within the domain of legislative power. No owners of land have the right to obstruct the free passage of fish up and down the streams. The legislatures have the right to regulate the taking of fish from private rivers, which are unquestionably private property.

Floods.—Riparian owners who collect water on their land must keep such water under control at their peril, and dams erected for the purpose of confining water or creating ponds, must be constructed with such care and skill as to make them capable of resisting usual and ordinary floods.

Ice.—Water congealed is ice. Ice formed upon private waters, and that includes rivers owned by individuals, is real estate and is the property of the owner of the soil over which it is formed. In some of the States, however, as in Michigan, it is held as personal property and can be sold as personal property. After it is cut and removed it is always personal property. The owners of land bordering upon navigable streams in States where they are held to be public property, have no title to the ice which forms on such streams; such ice belongs to the first person who appropriates it, but generally ice forming upon private fresh-water streams belongs exclusively to the riparian proprietors and they may prevent others from removing it and maintain trespass against those who cut it without permission.

Irrigation.—The right to take water from streams passing over land owned by individuals is regulated by law, and differs in different States. The right, however, is generally recognized that there may be a reasonable appropriation, but no total diversion of the water.

When the State or the government intervenes and takes control of rivers for the purposes of irrigation, then the streams are to be used according to the laws enacted for the purpose. This is so as to the use of all rivers that can be used for the general good of the public. The courts have jurisdiction over questions arising out of the use of rivers. The United States admiralty courts have jurisdic-

tion over causes of action arising in the large rivers as they do in the Great Lakes and the sea and coast waters.

Riverside, Cal., city and county-seat of Riverside County: on the Santa Fe, Southern Pacific, and Salt Lake R.R.'s; about 60 miles east of Los Angeles. It was founded in 1870 by settlers largely from the New England States and New York, and was incorporated as a city in 1886.

Riverside is famous as the largest citrus producing and shipping point in the world, the annual output of the citrus fruits in Riverside County being over 8,000 cars, of which something over 1,000 cars are lemons, the balance being oranges (nearly 6,000 cars of this fruit are shipped from the city of Riverside alone). There are about 40 packing houses in the city where oranges and lemons are shipped, employing over 1500 persons at the height of the season. Alfalfa and deciduous fruits are also successfully grown, and there is a large grain-producing area in the county.

Riverside has one of the most extensive and complete irrigation systems in southern California. The climate is remarkably healthful and the place is famous as a health resort. The architecture of the public buildings has been largely developed along Mission lines, and among the famous buildings of this character are the Glenwood Hotel, the Carnegie library and the high school building. The courthouse is a single-story building built along classic lines, all on the ground floor, and cost \$250,000. Riverside is the seat of Sherman Institute, a United States Indian School, which has over 600 pupils.

There are three banks with a combined capital of \$250,000, and deposits of about \$3,000,000. The government of the city is vested in a board of trustees of five members, two chosen at one election and three at the next, elections occurring every two years. Pop. (1905) about 10,000.

E. P. CLARKE,
Editor (*Daily Press*.)

Rives, rēvz, Alfred Landon, American engineer, son of William Cabell Rives (q.v.) and father of Amélie Rives: b. Paris, France, 25 March 1830; d. 1903. He was educated at the University of Virginia and at the Ecole des Ponts et Chaussées, Paris, where he was graduated in 1854. He was assistant engineer in completing the Capitol at Washington, was engaged on the aqueduct there, and later was in charge of the United States survey for improving the Potomac River. He was colonel of engineers in the Confederate army during the Civil War, and was afterward manager of various railways and engineering enterprises.

Rives, Amélie. See TROUBETZKOY, A. R.

Rives, Hallie Erminie, American novelist, b. Christian County, Ky., 2 May 1876. She has published: 'Smoking Flax' (1896); 'As the Hart Panteth' (1896); 'A Furnace of Earth' (1900); 'Hearts Courageous' (1902); etc.

Rives, William Cabell, American legislator and diplomat: b. Nelson County, Va., 4 May 1793; d. near Charlottesville, Va., 26 April 1868. He was educated at Hampden-Sidney and William and Mary colleges, studied law, and in 1816 was a member of the Virginia constitutional convention. In 1817-19 and in 1822 he served in the State legislature, and in 1823-9 was a member of Congress. He was minister to France in 1829-32, and in that capacity negotiated the treaty of indemnity in 1831. He served in the United States Senate in 1832-4, 1835-45, and in 1849-53 was again minister to France. He was a member of the peace conference at Washington in 1861, and after the secession of the South sat in the provisional congress at Montgomery, Ala. He published 'Life and Times of James Madison' (1859-69).

Riveting Machines. See METAL WORKING MACHINERY.

Riviera, rē-vē-ā'rā, a district bordering the Mediterranean coast, partly in France, partly in Italy, with Genoa as its central point. It extends to Spezzia on the east and Nice on the west, and is a favorite winter resort of invalids and others. The whole coast is traversed by a road and by a railway.

Rivière, rē-vē-ār', Briton, English painter: b. London, England, 14 Aug. 1840. He studied art under his father, a drawing master, worked at illustrating for many English and American publications and exhibited at the Royal Academy for the first time in 1864. He was elected A. R. A. in 1878, and R. A. in 1881. Among his most notable pictures, many of which have been engraved, are: 'Strayed from the Flock'; 'The Lost Sheep'; 'Legend of St. Patrick'; 'An Anxious Moment'; 'Circe'; 'Giants at Play'; 'Actæon'; 'Væ Victis'; 'Rizpah'; 'A Fool and His Folly'; etc. He is also known as a sculptor by his 'Anatomical Lion' (1888); 'A Dying King' (a lion, 1894); and 'The Last Arrow' (a lion-hunting scene, 1896).

Rivière du Loup, rē-vē-ār dü loo. See LOUISEVILLE.

Riv'ington, James, American printer: b. London about 1724; d. New York 4 July 1802. Early in life he was a bookseller in London, but in 1760 came to America, and opened a shop in Philadelphia, then in 1761 established himself in New York, and on 22 April 1773 began the publication of a newspaper entitled the 'New York Gazetteer, or the Connecticut, New Jersey, Hudson River, and Quebec Advertiser.' It was Royalist in sympathies and circulated among the Tories and gave to its publisher a position of some prominence. His affairs seem to have been under investigation by both the Provincial and Continental congresses, and he himself placed in temporary confinement. In November 1775, in consequence of his constant assaults upon the patriots, and especially Captain Sears, that officer came from Connecticut with a company of horsemen, proceeded to Rivington's printing office, destroyed the press, and converted the types into bullets. Rivington then went to England, and being appointed king's printer in New York, returned with a new press after the city had fallen into the hands of the British, and in October 1777 resumed the publication of his paper under the old title, soon changed to 'Rivington's New York Loyal Ga-

zette,' and on 13 December to the 'Royal Gazette.' About 1781, when the success of the British was becoming very doubtful, he played the part of a spy, furnishing Washington with important information. When therefore New York was evacuated, Rivington remained in the city and changed the title of his paper to 'Rivington's New York Gazette and Universal Advertiser.' The paper finally suspended publication in 1783, and he passed the remainder of his life in comparative poverty.

Rix, Julian, American painter: b. California 1851; d. New York 24 Nov. 1903. He used to say that he was "a pupil of nature," and appears to have had no regular academic training. He came to New York in 1888, and his work immediately attracted attention by its marked personal qualities. His California landscapes have been familiar ever since to all visitors to the exhibitions. His best paintings, among which are scenes in the Maine woods, were produced during the last five years of his life.

Rix Dollar, the English way of writing the names of different silver coins used in various European countries, as the *rigsdaler* of Denmark = 53 cents; the Swedish *riksdaler* = 27 cents.

Rizal, José, *hō-sā' rē-thāl'*, Filipino patriot and author: b. Calamba, province of La Laguna, Luzon; d. Manila 30 Dec. 1896. He studied medicine at Manila, and was graduated from the University of Madrid as doctor in medicine and philosophy; studied farther in Paris, Heidelberg, Leipsic, and Berlin; made researches in philology and ethnology; and was elected a member of the Berlin Anthropological Society. Having returned to the Philippines, he was soon compelled to emigrate, owing to the hatred visited upon him by the old Spanish party on account of his story, 'Noli Me Tangere,' descriptive of political conditions in the Philippines. He then resided in Japan, North America, and London, where he prepared an edition of Morga's 'Sucesos de las Islas Filipinas,' originally printed in Mexico in 1609. On the continent he wrote another political novel, 'El Filibusterismo.' Subsequently he practised medicine at Hong Kong, and went to North Borneo, where he purposed to establish an agricultural colony of Filipinos. Though he had obtained permission to visit the Philippines, he was arrested on arrival there, and banished to Dapitan. On the outbreak of the native insurrection against Spain, he was accused of being its instigator; and on a third trial was condemned and shot. The proceedings against him have been described as farcical. He was undoubtedly the most talented Filipino of recent times.

Rizal, rē-thāl', Philippines, a province of the island of Luzon, formed by the consolidation of the former province of Manila (excepting the city of Manila) and the district of Morong, bounded on the east by the province of Infanta and the Bay Lagoon, and on the west by the Bay of Manila: area, 1,026 square miles. The surface, except that part of the former province of Manila which lies south of the Pasig River (q.v.), is mountainous, traversed by a number of short irregular ranges. There are many plains which, though fertile, are often inundated by the Bay Lagoon to the destruction of crops. In the western part of the province, the betel is grown extensively, especially in the

vicinity of the town of Pasay; other products of the province are rice, sugar, corn, and tobacco; there are also extensive forests. A fine variety of building stone is quarried on the island of Talim, in the Bay Lagoon. The industries other than agriculture include lumbering, fishing, and the manufacture of lime, mats, and clothing for native wear. The trade of the province naturally concentrates at the city of Manila, and the railroad from Manila to Dagupan, numerous roads, and the waters of the Bay Lagoon and the Pasig River provide means of communication between the different parts of Rizal and Manila. The province was created and civil government instituted in June 1901. Pop. 246,940.

Rizzi, rēt'sē, Antonio. See RICCI, ANTONIO.

Roach, rōch, John, American shipbuilder: b. Mitchelstown, Ireland, 1815; d. New York 19 Jan 1887. He came to this country in 1829, obtained employment in various iron works and foundries, became a machinist and finally erected a foundry of his own. Later he established the Aetna Iron Works, where he constructed the first compound engines built in the United States, and also built the largest engines which had been made in the country at that time. In 1871 he purchased the Rainer shipyards at Chester, Pa., enlarged the establishment until its value was estimated at \$2,000,000, and under the name of the Delaware River Iron Shipbuilding and Engine Works, of which he was entire owner, built a large number of merchantmen and also constructed the first ships for the new United States navy, among them the cruisers Atlanta, Boston, and Chicago, and the despatch-boat Dolphin.

Roach, a small European fresh-water fish (*Leuciscus rutila*), of the family *Cyprinidae*, related to the dace, chub, etc., and a favorite of anglers, because so much skill is needed in hooking it. It rarely weighs more than a pound, and is grayish or bluish green on the upper parts, lightening into lustrous white on the abdomen.

Roach, an insect. See COCKROACH.

Road-runner, a bird. See CHAPARRAL-COCK.

Roads, Improvement of, the rural highways of America are poor, probably the poorest that prevail in any country which has reached so high a state of civilization. Americans have excelled their competitors in other countries in nearly all industrial pursuits and methods, and have produced nearly everything required for the advancement of civilization in greater abundance and greater perfection than is to be found elsewhere in the world. The deficient highway system of the United States is now receiving the earnest attention of the people and they will soon excel in good roads as they have already done in so many other lines of development. In extenuation of the existing condition it must be remembered that the territory is extensive and the mileage necessarily great. Much of the country is still new, and, in the older States, the improper location of many roads has been a hindrance to their permanent improvement because it is evident to the people in many cases that the permanent improvement of these mislocated roads would result in a loss of money, and, therefore, they are inclined to wait for a

GRADER AT WORK.

re-location. In the western country roads are mostly located on section lines running with the cardinal points of the compass east, west, north, and south, one mile apart; but in the older States roads were not located on section lines nor on scientific principles.

Some people object to the disadvantages in the western country that result from following section lines, because sometimes they run against obstructions. But it is better to have roads located on section lines, as they are in the West, than to have them located at random, as they are in the East, where they are seldom direct in their course. There are many places in the old States of the East where you will not see a road, nor a fence, nor a property line, nor a building nor an object of any kind erected or located by the hand of man that corresponds with any of the cardinal points of the compass. The lack of any uniform principle in the location of the permanent improvements in a country leads to circuitous roads and needless labor in a community. In following section lines in the West some of the roads may be wrongly located, but, owing to the absence of any system in the East, nearly all are wrongly located.

In addition to the ordinary difficulties encountered in so vast a work as permanently improving the highways of a great country, it has been supposed by many of the people that the railway system, which has been developed to such a remarkable extent in this country, would prove to be a sort of substitute for the ordinary highway system. President Roosevelt, speaking to this point in an address which he delivered before the National Good Roads Convention at Saint Louis, Mo., 29 April 1903, said:

... Of course, during the last century there has been an altogether phenomenal growth in one kind of road, wholly unknown to the people of old—the iron road. The railway is of course something purely modern. Now, a great many excellent people have proceeded upon the assumption that having good railways was a substitute for having good highways. A more untenable position can not be imagined. (Loud applause.) What the railway does is to develop the country, and of course this development implies the need of more and better roads.

In the United States the composite nature of the government has often led to a doubt as to who should have jurisdiction of the roads and who should bear the cost of their improvement. Some have thought that the United States government should assume the burden, and, in the early part of the 19th century, it built a great national road from Cumberland, Md., to Saint Louis, Mo., and other national roads of less importance. (See *ROADS AND HIGHWAYS*.) Some have thought that the States should assume jurisdiction and bear the burden of cost required for improvement, and this is now being done to a great extent in New England and New York. But the prevailing opinion of the people heretofore has been that the counties or local communities should maintain jurisdiction and bear the burden of cost. So, for generations the people living in the rural districts and owning the agricultural lands have borne the entire burden and have made substantially all the roads of this country. This is a burden, however, that rests too heavily on the rural communities and which they are either unable or unwilling to bear, and, as a result of this fact, all permanent improvement has been retarded. We are now

passing through in this country what England passed through 200 years ago, that is to say, we are trying to require a portion of the community—those living in the rural districts—to build and maintain the roads for the use of all the people. This is an unjust proposition that cannot be maintained successfully in this country any more than in England or other European countries. Macaulay, in his 'History of England,' after describing the almost impassable condition of the rural highways of England during the closing years of the 17th century, says:

One chief cause of the badness of the roads seems to have been the defective state of the law. Every parish was bound to repair the highways which passed through it. The peasantry were forced to give their gratuitous labor six days in the year. If this was not sufficient, hired labor was employed, and the expense was met by a parochial rate. That a route connecting two great towns, which have a large and thriving trade with each other, should be maintained at the cost of the rural population scattered between them is obviously unjust; and this injustice was peculiarly glaring in the case of the great North road, which traversed very poor and thinly inhabited districts, and joined very rich and populous districts. Indeed it was not in the power of the parishes of Huntingdonshire to mend a highway worn by the constant traffic between the West Riding of Yorkshire and London. Soon after the Restoration this grievance attracted the notice of Parliament; and an act, the first of our many turnpike acts, was passed, imposing a small toll on travellers and goods, for the purpose of keeping some parts of this important line of communication in good repair. This innovation, however, excited many murmurs; and the other great avenues to the capital were long left under the old system. A change was at length effected, but not without much difficulty. For unjust and absurd taxation to which men are accustomed is often borne far more willingly than the most reasonable impost which is new. It was not till many toll bars had been violently pulled down, till the troops had in many districts been forced to act against the people, and till much blood had been shed, that a good system was introduced. By slow degrees reason triumphed over prejudice, and our island is now crossed in every direction by nearly thirty thousand miles of turnpike road.

In a government having a composite nature like that of the United States it is not always easy to determine just what part the General Government, the State government, and the local government should respectively take in carrying out highway work, though it is generally admitted that there should be co-operation among them all. Leaders in State politics, governors, and other high officials, are very reluctant to recommend to the people that they levy taxes or issue bonds sufficient to meet the great expense of making the roads what they should be. For the past 100 years the leaders in the various States have been reluctant to recommend that their States assume the burden of cost which is necessary. As a result of this policy the entire burden finally fell on the local communities, that is, the counties, parishes, townships, and districts; so it is true as a general rule and with slight exception that all the rural highways of America have been produced by the farmers of this country, the general theory and practice being that the people in the cities should pave their streets and the people in the country should build and maintain their roads. But this burden has rested so heavily upon the shoulders of the agriculturists that they have not been able to make the progress which is required in order that our highway system may keep pace with our industrial development. It seems to those who have studied the question that the burden is too heavy for the agriculturists to bear, especially in view of the decline in land and agricultural

products within the last 25 years. And the case appears stronger when you consider that during the last 25 years there has been a most remarkable concentration of population and wealth in the great cities. In all of the States east of the Mississippi and north of the Ohio a majority of the people are living in cities and much more than half of the wealth is concentrated there. If the policy is pursued of resting the entire burden of improving the highways upon the people of the rural districts, one half, and in some cases more than three fourths, of the wealth of the country wholly escapes this burden.

When practically all the people lived in the country and very few in the city, this system of taxation was a fairly just one; nearly all the people contributed. It was the intention of the founders of the government that this should be the case. But with the concentration of wealth and population the burden has been shifted, and a large proportion of those most abundantly able to bear the cost now escape. In order to re-establish in a measure the original policy whereby all the people should bear all the cost of improving the roads, it is necessary to adopt a different plan.

The State aid plan works well in the States where it has been tried. New Jersey, Massachusetts, Connecticut, and New York have tried it, and now Pennsylvania and Delaware have come to the front with State aid laws. The plan of State aid, briefly stated, is this: The State pays a fixed part of the cost of building roads out of the general fund raised by taxation of all the people and all the property in the State. Under those circumstances corporations, railroads, trusts and the various representatives of concentrated wealth in the cities, all contribute to this fund. When the appropriation of the money is made, however, the fund is expended in the rural districts, but it must be supplemented by money raised by local taxation. In the State of New York, which I believe has the best method of all, the State pays one half, or 50 per cent, the county 35 per cent, and the township 15 per cent.

This leads to a consideration of the wisdom of extending the principle involved in State aid so as to include the United States government. As already stated, the United States began by building certain roads and paying the total cost. Later this policy was reversed and the government did nothing. Under the early policy the government did too much, and under the later policy too little. A policy should be adopted under which the government will supplement the funds raised by State and local taxation. In States which have adopted State aid, the funds raised locally are supplemented by the State funds. So, on the same principle, the funds raised by State and local taxation, should be supplemented by a fund contributed by the General Government.

It is a remarkable fact that no country in the world has ever succeeded in producing a permanent system of well improved highways without the aid of the general government of the country. To the extent that the matter has been left to the local authorities, to that extent the roads have remained unimproved or deteriorated after improvement. It is true that the English government has never taken any portion of the imperial revenues to improve the roads in the United Kingdom; but it is also true that during

the closing years of the 17th century Parliament passed many acts giving exclusive jurisdiction of the roads named to turnpike companies, with authority to collect revenue by taking toll from all the people passing over the road. Subsequent acts finally placed all the principal roads of the kingdom under the jurisdiction of these turnpike companies; and so the burden of building and maintaining the roads was shifted from the shoulders of the local community to the shoulders of the traveling public, which in those days was obliged to pass over the common roads as there were no railways. This practice continued for nearly 200 years and was only recently changed by abandoning the toll gates and placing the repair of the roads again upon the shoulders of the local communities. But this has proven to be unsatisfactory and the roads are deteriorating under the new plan, which is really a return to the old plan that had been abandoned more than 200 years ago. It seems likely that half the cost of maintaining these roads will have to be paid out of the imperial revenues of the general government.

A comparison of the cost of transportation over the common roads of the United States with the cost of transportation over the macadamized or highly improved roads in Europe shows that it costs from two to three times as much to transport the products of the country over the unimproved roads of the United States as it costs to transport similar productions and tonnage over the improved roads of Europe. About 8 cents per ton per mile is the average cost on European roads; whereas in the United States the cost is about 25 cents per ton per mile. This question has been thoroughly investigated by different State governments and by the United States government with the following results: In 1893 the Highway Commission for the State of Ohio reported that the average cost per ton per mile in that State was 25 cents. In 1896 the United States government, through the Office of Road Inquiries in the Department of Agriculture, after an extensive inquiry covering 1,200 counties in nearly all the various States of the Union, reported an average cost of 25 cents per ton per mile; and the Highway Division in the State of Maryland in 1898 reported the cost per ton per mile to be 26 cents in that State.

The macadam road is the cheapest, most durable and most suitable for the permanent improvement of country highways of anything yet devised, developed or discovered. The value of this road consists largely in its cheapness and simplicity. Before the days of John L. Macadam it was thought necessary to lay a substructure of heavy stone under the superstructure of the finished road in order to support it. Macadam contended that the substructure of heavy stone was not only useless but harmful, and that a comparatively thin layer, not to exceed 10 inches, composed of the angular fragments of broken stones reduced to a uniform size, would make a better road than a greater mass underlaid with a heavy substructure. He would allow no stone of greater weight than six ounces to go into the road. He also insisted that these angular fragments without a mixture of any other substance would consolidate under the traffic of the road so as to form a crust, smooth, hard, and impervious to water. The earth itself, he said, must not only bear the weight of traffic passing over

ROADS AND HIGHWAYS.

2. Typical State Road in New Jersey, built under the State aid plan by Hon. H. I. Budd, State Highway Commissioner.

ROADS AND HIGHWAYS

it, but the weight of the road itself, and the earth, when kept dry, is abundantly able to bear this weight; but if wet the foundation will sink irrespective of the heavy stone that may be laid in it. Isaac B. Potter, writing on this matter for the Good Roads Library, says of the origin and development of the macadam road:

The macadam road was not invented in a day. It is more a development than a creation. The roads of the ancients were often made of huge blocks of stone and some of them were laid to a depth of several feet, as though the stone itself were the main thing on which they relied to support their traffic. By and by it came to be noticed that large blocks of stone when placed at the surface of the road, soon became slippery; that the edges were soon rounded off; that this surface made an insecure footing for the horses' feet and a "bumpy," unpleasant roadway for travelers who rode over it. Then smaller stones, and in some cases gravel, was used as a top layer, but the large stones were still retained in the bottom of the road. When a new road was made huge trenches were dug to the full width of the roadway and sometimes several feet deep. In the bottom of one of these trenches large, rough stone blocks were laid, one layer on another, until the trench was nearly filled. Small stones were used in the upper layers and finally the finishing layer was composed of small broken stone or gravel. Some of these roads were very good, but they were all expensive and unreasonably so. Thousands of tons of stone, millions of wealth and endless labor were wasted in work that was wholly unnecessary and useless. Macadam rejected the method of Tresaguet which included a pavement of large, rough stones set on edge and adopted a method of construction which soon proved its excellence and made him famous. It has since been largely adopted by the engineers of France and other countries and is today the method almost wholly used in making country roads in France, Switzerland, Germany and England.

Nothing has marked the advancement in road building within the last generation as much as the application of labor-saving machinery, now used in road construction. In the days of Macadam the stone was all broken by hand and the process of consolidation was effected by the daily traffic as it passed over the road while in the process of construction. At the present time we have rock crushers for the purpose of reducing the stone to angular fragments; revolving screens for the purpose of separating the stone into different sizes, and from the dust, which is used as a filler and binder over the larger fragments. The power that crushes the rocks also elevates the resulting product into high bins, from which the road surfacing material is loaded into automatic dumping carts by gravity alone, and then these automatic dumping carts or wagons when driven to the road that is under construction are emptied of their contents by gravity and the material spread upon the roadbed at a uniform width and thickness by the forward motion of the automatic dumping carts or wagons as they discharge their loads. These angular fragments are crushed by machinery and separated by the automatic process without the hand of labor being applied in the ordinary manner, and are finally consolidated into a hard, smooth and impervious crust by the passing of a steam roller over the surface many times in succession after the mass has been sufficiently moistened by the application of water, which is generally done by means of an ordinary street sprinkler. So that the finished road may now be produced in a more scientific manner than ever before, but at the same time with greater economy and much less cost, because the application of machinery has been substituted for the primitive hand of common labor.

In addition to the improvements introduced

in the crushing, handling and consolidating of the mass of stone used in the macadam roads, there are many other useful inventions in the way of earth handling machinery by which the cost of grading and shaping the road-bed is much reduced. In addition to the macadam road there are various other kinds in use in the United States, among them being the chert roads common in the South, the brick roads common in the North, and the gravel roads common in both the North and South.

MARTIN DODGE,

Director Public Road Inquiries, United States Department of Agriculture.

Roads and Highways. Statesmen, diplomats, historians, and scientists agree that the most important element which lies at the root and beginning of a nation's progress, and that which is indeed the greatest part of the foundation of a country's civilization, is a system of good roads. Without this the national resources and energies remain to a degree unawakened and useless. Roads are the veins and arteries by means of which the circulation of the social body is carried on. Where they are clogged the march of civilization is retarded. The people have little in common. Unity of purpose finds little place with them. Limited opportunity for intercourse of any kind hurts their commercial prospects. The natives of a country entirely without roads would of necessity be simply savages. The absence of good roads would manifestly have retarded progress in the United States had it not been for the fact that the country and the locomotive practically grew up together.

Roman Roads.—The ancient Romans were the pioneer constructors of roads, and regarded them as of vital importance for conquest and the maintenance of their empire. They are said to have learned the art from the Carthaginians. Except where some natural barrier made it impossible, the Roman roads were almost invariably in straight lines. The substantial character of these early highways is well demonstrated by the fact that they have in some instances borne the traffic of 2,000 years without material injury. The Appian Way, the "Queen of Roads," reaches its magnificent distance of 350 miles out from the gray walls of imperial Rome, under arches of imperishable fame, past massive ruins, over weird catacombs, and has won a name for all time as the royal Roman road. The Appian Way was begun by Cæsar Appius Claudius, the blind, in the year 312 B.C., and reached to Capua, afterward being extended to Brundisium. Over the "Queen of Roads" passed the Apostle Paul, and other saints and martyrs have trod the imperial way over the Campagna, and under the arch of Drusus into Rome.

British Roads.—It was the boast of Great Britain 100 years ago that, beyond all rational

ROADS AND HIGHWAYS

dispute, it stood at the head of the world's civilization, because no country on the face of the earth was so well provided with good roads. The length of pike-roads and highways in Great Britain in 1820 reached a total of 114,829 miles. These British roads were often the noblest exemplification of engineering skill, which subjugated and triumphed over great physical difficulties. Many of the British roads were carried over rivers, supported across ravines and hollows by stupendous embankments, driven underground through mountains, and sometimes terminating on piers extending far into the sea. The union of England and Scotland was due not to the kingly compact of 1707, but to the completion of a great highway between London and Edinburgh. This Great North Road, as it has been called, was later extended north from Edinburgh to the remotest extremity of Scotland—a distance greater than from London to Edinburgh. The North Road, which passes through Stamford, Doncaster, York, Durham, and Newcastle, is some 340 miles in length. Arched bridges, as a part of it, were built over the South Esk at Montrose, over the Don at Aberdeen, and over the Dean and the Tyne, the Findhorn, and the Lossie. For 37 miles the road follows the coast line entirely at Aberdeen, and thence strikes across country to Elgin, a distance of 67 miles. Notwithstanding that this section passes over much hilly country, it is so artfully conducted that hardly a single heavy grade is encountered the whole way. The good results of such a road were soon made manifest. The manufacture of coaches and private carriages was materially increased. Inns were established along the highway, the mails were carried more frequently and more quickly, the value of property was greatly increased, trade was promoted, and the general condition of even the poorest inhabitants was ameliorated by numerous accommodations and comforts which were formerly entirely beyond their reach.

The progress of civilization in India is owing largely to the military highway built by the British from Bombay to Calcutta. The English did much also for the interesting island of Jersey by building military roads across the island and around it in the year 1817. In Norway there are many important, well kept roads, and among them the great highway extending from Christiania to Leirdalsoren is conspicuously prominent. This road is 150 miles long and for the greater part of the distance winds through the mountains. The road systems of Austria, Switzerland, and some of the German states are vastly superior to anything in the United States.

Roads in France.—To-day France probably leads the world in a system of good roads. Although her area is only about four times as great as that of the State of New York, France has spent about \$600,000,000 in the construction of her common roads, and annually spends about \$18,000,000, or three per cent, of the first cost, in keeping them in repair. France has 87 departments, answering somewhat to our counties, and within these are various forms of local governments bearing some resemblance to those generally adopted in our cities and towns. The government maintains a large body of trained engineers in its special department of roads and

bridges, to which is entrusted the practical work of constructing and repairing the common roads. These comprise: first, national roads, which generally cross several departments, connecting important cities and towns; and second, department roads, which connect the chief cities and towns within the department. The less important roads are still further classified and divided, but the roads within a department are under charge of an engineer-in-chief, whose directions to his corps of subordinate superintendents and overseers must be implicitly followed. No part of the road system of France escapes attention, and every road is subdivided into sections varying in length according to its importance.

Chinese Roads.—Even in China, the great uncivilized, the public roads are in many ways admirable from their regularity, good condition, and comfort. Upon the government highways immense bridges have been built from mountain to mountain and over deep ravines. In the Alpine-like region of Xeusi there is a government road built for the most part over bridges and along the sides of mountains at an enormous outlay of labor. This road is said to have been built under the supervision of a famous general and by his army of many hundred thousand men. In building imperial highways, as in the construction of their canals, the Chinese delight in straight lines, consequently mountains are leveled or tunneled and valleys filled up to meet the road requirements. In some provinces the public highways are flanked by rows of trees on either side, or by a wall eight feet high to prevent travelers from damaging the well-cultivated fields and gardens.

American Roads.—In America, the construction of extensive public highways in this country was begun so long ago as 1776, when the first artificial road was built from Philadelphia to New York, and later the famous stage road from New York to Boston. An often proposed grand boulevard from ocean to ocean had its genesis early in the century when Ohio asked for admission to the Union. It was then a debatable question whether emigration would be drawn to Ohio, from the fact that it was cut off from the seaboard at the east—the great Alleghany Mountains forming a barrier which seemed to be impassable. The natural highways then were the waterways, the navigable streams, but it was a very long distance down the Ohio and down the Mississippi, and the journey was attended with such risks and expense that it was deemed almost impracticable. In the Senate of the United States, Henry Clay devised the means. He suggested that when Ohio was admitted into the Union there should be set aside 20 per cent,—afterward reduced to 5—of the proceeds of the sale of public lands in that State, after deducting expenses, for the purpose of building a road to connect with the Ohio River the waters that flowed into the Atlantic Ocean. Among the appropriations that were designed by Congress to help and aid that work two were vetoed, but by the indomitable perseverance of Henry Clay, which won for him the appellation, "The Father of Public Improvements," he carried his plan to a successful termination. The road which was finally built was variously known as the Great Western or National Turnpike Road, the National Highway, and the Cum-

ROADS AND HIGHWAYS.

ROADS AND HIGHWAYS

berland Road, and connected the District of Columbia with the Ohio River. Commenced in 1806 and built at a cost of \$1,800,000, it was the first internal improvement of any magnitude undertaken at public expense. Before the close of the year 1831 over \$200,000 had been expended upon it in repairs. The road ran from between a point nearly opposite Steubenville, Ohio, and Wheeling, in West Virginia, through Ohio and Allegheny counties to Cumberland, thence through Cumberland and Washington counties and in Frederick County to Frederickton, all in Maryland. Connecting there was a road that led to Baltimore and one that led to Washington, D. C. The national road had a uniform width of 80 feet, and was afterward extended westward from the Ohio River to Indianapolis. Other highways followed this pioneer turnpike, and prominent among these was the Old State Road from Albany to Buffalo and thence westward through Cleveland to the prairie lands of the Mississippi Valley.

The Santa Fé Trail.—The original highway across the western prairie region was the famous Santa Fé Trail extending from Saint Louis to Santa Fé, N. M., and was first established early in the century. The people of Missouri in 1825, secured a congressional appropriation of \$30,000 for the building of a better wagon road to Santa Fé. I. C. Brown made the survey, but the road was never completed. The first Santa Fé Trail was directly westward from Independence, Mo., to the mountains of Colorado, and thence south to Taos, which is about 175 miles north of Santa Fé. Afterward, as the trade grew, another trail was considerably used, the route which was followed substantially by the Atchison, Topeka and Santa Fé Railroad. But the favorite "old Santa Fé Trail" was that along the Arkansas, thence across to the Cimarron, thence almost in a direct line to Wagon Mound, N. M., a conspicuous landmark, thence to Las Vegas, San Miguel, and Santa Fé. To the northward the pony express blazed the way across the plains to the Pacific coast, followed by the stage-coach and the wagon trains, and later the Union Pacific Railway marked the path of commerce that eventually brought the Atlantic and Pacific in close relation. From those pioneer days to the present the United States have been building roadways—north, south, east, and west—only when increasing internal commerce made it necessary, and the roads thus constructed were made cheaply and with no eye to the future.

Road Building.—The fact is patent that the United States government has practically wasted hundreds of thousands of dollars in repairing and maintaining poor roads, which is in itself another argument in favor of great national highways of proper construction. Measured by every rule of economy, the common roads of the United States constitute a poor investment and are the worst in the civilized world. For nearly a century the United States has been expending more in labor and money to carry on a system of inefficient and shiftless roadways than would be sufficient to keep in proper repair double the length of high class roads under the methods pursued by France, Italy, and other countries in Europe. In this almost hopeless struggle for road reform America has but followed in the footsteps and repeated the history of European

nations, where, in the beginning, the same obstacles were encountered and the same objections urged which meet the American to-day. Road building is in itself an art apart—a type of engineering accomplishment—to which few men have given more than brief study, and none, so far as we know, have made the subject a life-work. The properly built highway is something more than the work of an engineer, for it is a boon and a blessing to mankind and to civilization. Like a great poem, it will live in after years and bring fame to the man who has built intelligently and for all time. In the laying out of a new road the skill and ingenuity of the engineer are taxed to make the gradients easy, with as little expense as possible in excavating and embanking, without deviating much from the direct course between the fixed points through which the roads must pass. In order to do this, an accurate survey of the tract, including the relative levels of its different parts, and the nature of the strata, is a necessary preliminary. The formation of an extended line of road often involves the construction of extensive bridges, viaducts, and the like, which requires the greatest engineering skill. The best method for road building is a much debated subject among engineers, and there are many systems which are worthy of consideration. The great rival systems of Telford and Macadam are perhaps the most widely known, but the many systems afford a fascinating study for one interested in the welfare of mankind.

Ocean to Ocean Boulevard.—Considering the plan for a great national highway from ocean to ocean, a grand boulevard stretching from the Atlantic to the Pacific, the scheme appears so feasible that one marvels it was not accomplished long ago. The air-line distance from New York to San Francisco is 2,600 miles, and the railroad distance 3,370 miles. The railroads, in order to reach commercial, mining, and manufacturing centres, vary greatly from their natural route. A national ocean-to-ocean highway should traverse the distance in about 3,000 miles, starting from Boston and passing through the cities of Buffalo, Cleveland, Toledo, Chicago, Omaha, and Denver to San Francisco. The suburban system of boulevards in each of these cities will average 25 miles from east to west, making a total of 200 miles of a great national roadway already constructed. A hundred smaller towns and cities with well paved roadways, averaging from 2 to 10 miles from east to west, will add 500 miles, making in all scarcely more than 2,000 miles of roadway to be built. Of this 2,000 miles, fully 1,200 miles of roadway already exist in main-traveled highways from east to west, and these inland roads would be widened and improved. This would leave but something like 800 miles of roadway to be bridged, blasted, or filled. In the event of a national highway being built across the continent, it has been suggested that convict labor be employed in the construction of the road, each State adding its quota. Heretofore, there has been great objection to this class of labor in almost every line of work, on account of the feeling that convicts employed in this way deprive free labor of its function. This is universally true except in road building, for on account of the great expense coincident with the employment of free labor, no State has un-

ROAN ANTELOPE — ROANOKE ISLAND

dertaken to build roads to an extent great enough to require a large amount of it. Convicts have been used abroad in building many important local and national works. The great docks at Liverpool, which virtually made that city famous, were constructed entirely by such labor. It is safe to say that these huge structures would never have been built had the work necessitated the employment of free labor with its accompanying cost. Time need be given little consideration in the construction of an ocean-to-ocean boulevard. In this age of rapid construction the element of time is practically annihilated. That far-famed monument of antiquity, the Great Wall of China, was completed within a space of five years, and the length of this great wall is upward of 1,500 miles. The country over which it passes is wild and hilly, and in some places it is built on the steep sides of mountains between 5,000 and 6,000 feet above the level of the sea. The wall crosses rivers and valleys, and in some places large tracts of marsh land were great obstacles to the architects, but all these difficulties were overcome. To accomplish this work the power of a despotic emperor was exerted, and every third man in the kingdom was forced to labor at the undertaking.

WILL M. CLEMENS,

Editorial Staff, 'Encyclopedia Americana.'

Roan Antelope, a large and handsome South African antelope (*Hippotragus equinus*), related to the exterminated blaubok and the beautiful sable antelope, which is of a reddish hue, with strong black and white markings on the face. It is becoming very rare.

Roanne, rô-än, France, town in the department of the Loire and an important railway junction, 59 miles by rail northwest of Lyons. Extensive engineering work shops are located here, besides iron and copper foundries, many dye-works, pottery and tile works. Pop. (1901) 34,568.

Roanoke, Va., city in Roanoke County; located on the Roanoke River and on the Norfolk & Western railroad, 53 miles west of Lynchburg. Roanoke was formerly a leading tobacco market, but in later years has become the centre of a large section rich in iron mining and farming interests.

Industries.—Roanoke has extensive iron manufacturing interests, rolling mills, tobacco factories, bottling works, box factories, locomotive and car shops, canning factories, wheel and spoke factories, machine shops, saw mills, planing mills, wooden-ware factories, knitting and silk works, iron furnaces, bridge works, foundries, rolling mill, cotton mill, carriage and wagon factories, and many smaller industries. It had an assessed property valuation in 1903 of \$13,158,881.58. Municipal tax rate, \$1.25 on the \$100.

Public Buildings.—The Virginia College for young ladies and the National Business College for both sexes are located here, and the famous Hollins Institute for young ladies is located within seven miles of Roanoke. There is also a very fine high school, and grammar and other schools, court-house, city-hall, Academy of Music, and numerous fine business blocks.

Government.—The city is governed by a mayor and city council elected by the people. There is an excellent paid fire department and

electric street railways and electric lights. The city has an improved sewer system and two waterworks plants. There are several national and State banks, excellent hotels, daily and weekly newspapers and monthly periodicals.

Population.—Roanoke was incorporated in 1884, and has grown steadily in population and wealth. At that time the population was 5,000; in 1890 it had 16,159 inhabitants, and in 1900 this had increased to 21,495. The estimated population in 1904 is 27,000.

E. B. JACOBS.

Secretary Roanoke Chamber of Commerce.

Roanoke, a river in Virginia and North Carolina, formed by the confluence of the Dan and Staunton rivers at Clarksville, Va. It flows south and southeast for nearly 300 miles, entering the Atlantic Ocean through Albemarle Sound. It is a tidal stream fully 80 miles from its mouth and is navigable to its source. The Dan and Staunton are navigable for small vessels for some distance from the Roanoke. At Halifax, N. C., there are rapids and falls which furnish considerable water-power. A canal has been built around this obstruction to navigation.

Roanoke College, located at Salem, Va. It was established in 1853 under the auspices of the Evangelical Lutheran Church, and is governed by a self-perpetuating board of trustees. It offers a classical course, leading to the degree of A.B., and a business course, and has also a preparatory department. It is coeducational, but few women have enrolled. The college possesses a numismatic collection of considerable value, a library with 22,000 volumes (in 1904); and grounds and buildings valued at over \$100,000. The productive funds amount to \$65,000, and the annual income in 1903-4 was \$14,000. The students numbered 152, and the faculty 11.

Roanoke Colony, The, in American colonial history, the name applied to a famous land grant of the crown. In 1584 Sir Walter Raleigh, having obtained a large grant of land from Queen Elizabeth, sent out 9 April, seven vessels and 108 settlers under the command of Sir Richard Grenville. After skirting the West Indies and Hispaniola, they landed at Roanoke, in North Carolina, 20 June. Ralph Lane was left in charge of the settlement and Grenville returned to England. During the following winter Lane made numerous exploring expeditions and suffered greatly from Indian attacks. In the spring he received some aid in men and supplies from Sir Francis Drake, but finally the settlers persuaded Drake to take them home. Soon after Grenville arrived with new settlers. These had been destroyed by the Indians when, in 1587, a new colony of Raleigh's, under White, came out. White himself returned to England. When he came back (1590) he found the colony vanished. It seems to have been destroyed by the savages, though there is a theory that descendants of the colonists are still to be found among North Carolina half-breeds.

Roanoke Island, Battle of. After the capture by Union troops of Forts Hatteras and Clark, at Hatteras Inlet (q.v.), 29 Aug. 1861, the Confederates began to erect works on Roanoke Island, to command the narrow channel connecting Albemarle and Pamlico sounds, considered as the key to one third of North Caro-

CARROLLTON AVENUE, NEW ORLEANS.

This street, on the outskirts of the city, was chosen for improvement. The picture was taken on the morning of April 26th, before the experiment was begun.

ROARING—ROBBE-FLY

lina, the possession of which by the Union forces would enable them to reach the railroad connecting Richmond with New Orleans. The Union authorities decided to seize the position, and 7 Jan. 1862 Gen. Burnside, who had a division of 12,000 men, was ordered to seize and hold Roanoke Island, capture Newbern and Fort Macon, open the harbor of Beaufort and, if practicable, to advance from Newbern and seize the railroad to Goldsboro. On 7 January vessels carrying the troops set sail from Annapolis, and by night of the 10th more than 80 vessels of all kinds had rendezvoused at Fort Monroe, 20 being war vessels, carrying over 60 guns, under command of Flag-Officer L. M. Goldsborough. The fleet was divided into two columns under Commanders S. F. Hazard and S. C. Rowan. The expedition sailed from Fort Monroe on the night of the 11th, and after many mishaps, in which some vessels were lost, by 4 February had passed into Pamlico Sound, and orders were given for the advance on Roanoke Island. On the morning of the 5th the start was made, with 65 vessels in all, naval vessels and transports. On the 7th the armed vessels engaged the Confederate batteries on the west side of Roanoke Island, and also small gunboats, which were soon driven off. The forts were silenced and on the morning of the 8th Burnside had over 8,000 troops and a battery ashore at Ashby's Harbor. Confronted by Confederate works, manned by nearly 6,000 men, he had formed his division into three brigades, commanded by Gens. J. G. Foster, Jesse L. Reno, and John G. Parke. The advance was ordered early in the morning, Foster leading, in the centre, Parke on the right and Reno on the left. While Foster pressed the front and engaged with his artillery, Reno, marching at times waist-deep in the mud of the swamps, gained the right of the Confederate position, Parke, in the same manner gaining the left, and, after a more than three hours' fight, a simultaneous charge was made and the entire position carried. This cleared the road. Burnside marched to the head of the island, where the forts on the shore and their entire garrisons were captured. The Union loss was 37 killed, 214 wounded, and 13 missing. The Confederate loss was 23 killed, 58 wounded, 62 missing and about 2,650 captured, including 159 officers. The Confederate gunboats went up Albemarle Sound to Elizabeth City, pursued next morning by Commander Rowan, with 14 vessels. Rowan promptly attacked, and after a short but severe engagement, Lynch, the Confederate commander, ordered the abandonment of his boats, ran them aground and set them on fire. Rowan had 2 killed and 6 wounded. Having gained entire possession of Roanoke Island and the control of the inland waters of North Carolina, Burnside's next step was the capture of Newbern (q.v.). Consult: 'Official Records,' Vol. IX.; the Century Company's 'Battles and Leaders of the Civil War,' Vol. I. See NEWBERN, OPERATIONS AT, IN THE CIVIL WAR. E. A. CARMAN.

Roaring, a disease of horses whereby the air-passages are partially obstructed, giving rise, when the horse is briskly exercised, to a peculiar noise in breathing. The disease is due to inflammation of the larynx or of the windpipe, with wasting or paralysis of some of the laryn-

geal muscles, whereby the glottis becomes contracted. The fluid discharged from the affected parts, changing into a tough, viscid substance, adheres to the larynx and upper part of the windpipe and further obstructs them. But the specific causes of roaring are various. It sometimes follows strangles. Carriage-horses are more subject to it than saddle-horses, and this is explained by the injury done to the larynx by tight reining. There are also various kinds of roaring, distinguished by the sounds, as whistling, wheezing, high-blowing, and piping. The disorder does not appear to be amenable to treatment, though in early stages, as when it proceeds from catarrh or influenza, it may be relieved by blisters or setons. The disease renders a horse unsound, as it unfits him for the ordinary strain of work.

Roaring Forties, a sailor's term for a region of the great Southern Ocean lying south of latitude 40° to 45° S., where strong and often stormy west-northwest winds prevail. Owing to these winds the outward voyage to Australia by sailing vessels is made via the Cape of Good Hope and the homeward voyage via Cape Horn. The same name is sometimes given by analogy to a belt of the North Atlantic about 40° to 50° N.

Roasting. See COOKERY.

Rob Roy (Robert the Red), Roy, or Gael Ruidh, meaning "red"; Scottish Highland freebooter; b. Buchanan parish 1671; d. Balquhiddy 28 Dec. 1734. His true name was Robert Macgregor, but he assumed that of Campbell, on account of the outlawry of the clan Macgregor by the Scottish Parliament in 1693. He was a trader in cattle previous to the rebellion of 1715, in which he joined the adherents of the Pretender. On the suppression of the rebellion the Duke of Montrose, with whom Rob Roy had previously had a quarrel, took the opportunity to deprive him of his estates; and the latter began to indemnify himself by a war of reprisals upon the property of the duke. His was a lengthy and eventful career with many hair-breadth escapes from his enemies. Consult: Sir Walter Scott's 'Introduction' to his novel of 'Rob Roy' (1818) for a full account of this chieftain, interest in whose name was aroused largely by that work; also lives by Macleay (new ed. 1881) and Miller (1883).

Robber Council. See EUTYCHES.

Robber-fly, one of the slender and long-bodied but strong and active flies of the family *Asilidae*, which prey upon many kinds of insects, by darting upon them, and stabbing them with their dagger-like beaks. These instruments are armed at the tip with bristles which prevent the victim from escaping until his death is accomplished. Some species might easily pierce a man's skin, but do not do so, nor attack cattle. They are an enemy to be dreaded by bee-keepers, however, as they attack bees and where numerous may seriously interfere with their disposition to gather honey or even prevent swarming. Hence a common name is "bee-killer." Some of them resemble wasps, to whom their evil deeds are often attributed. They lay their eggs in earth-mold or rotten wood, and the larvae live in the ground where they prey upon insects and their eggs. Over 3,000 species are known, of which about 400 are American. Consult Howard, 'The Insect Book' (New York, 1901).

Robber Palm, or **Cocoanut Crab**, a large and powerful land-crab (*Birgus latro*) of the East Indies, related to the hermit-crabs, which lives in a hole in the earth under trees, lining its burrow with the fibrous cocoanut husks, has an almost lung-like modification of the gill-cavity for breathing air directly, yet visits the sea annually in droves to spawn. It goes abroad only at night and feeds on cocoanuts, though it does not climb for them, and is itself eaten in Amboyna and elsewhere. Darwin has graphically described how it tears the husk from the cocoanuts, and hammers on the round depressions at one end until entrance is effected. Consult Forbes, 'A Naturalist's Wanderings' (1885).

Robbery, is the wrongful taking, without a claim of right, of a thing of value from one's person against his will, or by force, or through placing him in fear. In the United States the offense is regulated by the statutes of the various jurisdictions, in some of which the degree of guilt depends on the nature of the act. Actual force need not be employed to induce fear, and fear may extend to a threatened destruction of one's property, or injury to reputation. The law does not hold that the property must be in the actual physical possession of one, or in contact with his person, but merely that it must be in his presence, or in his immediate control; the property need not belong to the person from whom it is taken. Two or more persons may be equally liable for robbery if participating in any of the acts by which it is carried out. Punishment for robbery is fixed by statute.

Robbia, rōb'bē-ā, **Luca della**, Italian sculptor: b. Florence 1400; d. 1482. In the Early Renaissance he appeared as the foremost artist of all his contemporaries, and created a new school of sculpture by his marble friezes for the organ-loft of the Duomo at Florence. These are still to be seen in the Bargello Palace of the same city. The work was completed in 1445 and represents in ten panels angels and boys, singing and playing on various instruments, to the rhythmic movement of the dance. For refined and chastened fancy, skilful grouping and animated expression this masterpiece showed a vast advance on the hieratic sculptures of mediævalism. The enthusiasm with which it was greeted was redoubled, when in conjunction with Michelozzo and Maso di Bartolommeo, he executed the bronze doors for the Old Sacristy of the Duomo (1446-64). His name is, however, especially associated with works in clay reduced to pottery in the kiln, and colored and glazed like faience. This faience sculpture was unknown before his time and in it he improved the common process of glazing by a new method all his own. Numberless were the reliefs, medallions, tympanum groups, altars and other decorations which he and his pupils produced in this style. He began by plain white reliefs on a flat blue ground; the flawless beauty of his profiles in many sculptures of this kind have been the inspiration of succeeding artists. But he gradually enriched the coloring by the addition of other tints, some critics think, with a loss to classic purity and simplicity; yet the harmonious composition of his designs, the charm of expression which appears in everything he did, added to the boldness with which he ventured into a new field of plastic art have won

for him a sort of unique glory among the artists of the Renaissance. His works and those of his pupils are met with in every part of Tuscany, and some examples may also be seen in the museums of Europe. Among his most eminent pupils were his nephew, Andrea della Robbia (1437-1528); and the sons of this latter, Giovanni (1469-1529); and Girolamo (1488-1566). Consult: Barbet de Jouy, 'Les Della Robbia' (1835); Cavallucci et Mohnier, 'Les Della Robbia' (1884); Leander Scott, 'Luca Della Robbia' (1883).

Robbin, rōb'īn, **Albert Farthing**, English writer: b. Launceston, Cornwall, 1 Aug. 1856. He entered journalism in 1871 and has long been London correspondent of the *Birmingham Post*. In addition to several comedies and other dramas he has published 'Practical Politics or the Liberalism of To-day' (1888); 'The Early Public Life of William Ewart Gladstone' (1894); etc.

Robbins, rōb'īnz, **Wilford Lash**, American Protestant Episcopal clergyman: b. Boston, Mass., 7 Aug. 1859. He was graduated from Amherst in 1881, studied at Cambridge Theological Seminary, was ordained deacon in 1884 and held his first charge at Lexington, Mass., where he was advanced to the priesthood in the following year. He was appointed dean of the Cathedral of All Saints at Albany 1887-1903 and in the year last named became dean of the General Theological Seminary. He has published: 'An Essay Toward Faith' (1900); 'A Christian's Apologetic' (1902); etc.

Robert I., king of Scotland. See **BRUCE**, **ROBERT** (3).

Robert II., king of Scotland, son of Walter III., steward of Scotland, and Marjory, daughter of Robert Bruce: b. Scotland 2 March 1316; d. Dundonald Castle, Ayrshire, 13 May 1390. He was recognized as heir to the Scottish throne by Parliament in 1318, but superseded by a son afterward born to King Robert, who succeeded him in 1329 under the title of David II. In 1333, Robert, then steward of Scotland, was a leader at Halidon Hill and in 1334 was appointed joint regent with Moray. In 1338-41 he was sole regent and after the battle of Neville's Cross in 1346, where King David was taken prisoner, was again made regent. After the death of David in 1371 Robert was declared king and was crowned shortly afterward, the first of the Stuart dynasty. He ratified a treaty with France in the first year of his reign, and continued a nominal truce with England until the succession of the English king, Richard II., with whom he waged two wars. In the latter of these Richard II. and the Duke of Lancaster made successful forays into Scotland. In 1388 these were avenged by an invasion of England by two armies and the famous battle of Otterburn (Chevy Chase) was then fought. The long continued border wars and the disorders caused by the turbulent barons caused the king, whose increasing age disinclined him to the arduous duties of reigning, to entrust the management of the kingdom to his second son, the Duke of Albany, in 1389, and he then retired from public life.

Robert III., king of Scotland, eldest son of Robert II.: b. Scotland, about 1340; d. Rothesay, Bute, 4 April 1406. He was originally known as John Stuart, Earl of Carrick, but assumed

the name of Robert on his coronation in 1390. He possessed little strength of mind and incapacitated for military service by his lameness, delegated, therefore, the guidance of military affairs to his brother, the Duke of Albany. The friends of the king's eldest son, the Duke of Rothesay, forced the abdication of Albany in 1398 and war was renewed with England. Scotland was invaded for the last time by an English king in 1400, and in 1402 the Scottish troops met with disastrous defeat at Homildon Hill. Albany then regained the regency, imprisoned Rothesay at Falkland Castle, where he starved him to death, and caused Robert III., in his terror of him to send his second son James to France for safety. James was captured and imprisoned by the English and his father on learning of the event went into melancholy and died soon after. Scott's 'Fair Maid of Perth' is based upon various incidents related above.

Robert, Duke of Normandy, surnamed **THE DEVIL**: d. Nicæa, Asia Minor, 22 July 1035. He was the younger son of Duke Richard II. and ascended the throne in 1028 in succession to his brother, Richard III., whom he was said to have poisoned. The earlier years of his reign were passed in the subjugation of his vassals. Then he interfered in various princely quarrels, restoring Baldwin IV. of Flanders to his estates, and aiding Henry I. of France against the plots of the latter's mother. In 1034 he undertook an expedition against England, in support of his nephews, whom Canute had excluded from the succession, but his fleet was wrecked off Jersey, and the attempt failed. He now set out on a pilgrimage to Jerusalem; and while returning died suddenly in Nicæa, poisoned, perhaps, by his servants. His heroic deeds and penance have given rise to numerous stories. 'La Vie du terrible Robert le Diable, lequel fut après l'Homme de Dieu' appeared in 1496, and was much imitated. On it was based the grand opera, 'Robert le Diable,' text by Scribe and Delavigne, music by Meyerbeer. William the Conqueror was his son. Consult: Tardel, 'Die Sage von Richard dem Teufel' (1900).

Robert, Henry Martyn, American military engineer: b. Robertsville, S. C., 2 May 1837. He was graduated from West Point in 1857, was assistant professor of philosophy, and later of military engineering there in 1857-8 and served on frontier duty 1858-61. He was on the staff of General McClellan and on duty as an engineer through the Civil War, was promoted captain in 1863 and served as professor of military engineering at West Point in 1865-7. In 1867-95 he was on duty in connection with river and harbor improvements, lighthouses and fortifications. He was made president of the board of engineers for fortifications in 1895, was promoted brigadier-general chief of engineers in 1901 and was retired shortly after. He has published 'Robert's Rules of Order' (1876).

Robert, Louis Leopold, French painter: b. Les Eplatures, near Chaux-de-Fonds, Switzerland; d. Venice 20 March 1835. His teachers were the copperplate engraver Girardet in Paris, and the painter David. In 1818 he visited Rome and the study of life among the common people there furnished material for some of his smaller genre pictures. He was especially happy in his representation of robber life in Italy, and his

'Sleeping Brigand' in the National Gallery at Berlin is much admired. But it was at Naples that he found material for his first masterpiece 'The Improvisator' (1823). This was succeeded by 'The Return from the Festival of the Madonna' (1827), now in the Louvre; 'The Arrival of the Reapers in the Pontine Marshes' (1830) in the Louvre; of which latter a replica with variations is in the Berlin National Gallery. In 1832 he visited Venice and completed 'The Departure of the Fishermen of the Adriatic.' An unrequited attachment for the Princess Charlotte Bonaparte preyed upon his mind and he committed suicide in Venice. In his pictures the life of the Italian common people is delicately idealized, and among his contemporaries his works were greeted as they appeared with the greatest enthusiasm.

Robert of Gloucester, English historian. He was a monk in the abbey of Gloucester in the latter half of the 13th century, but of his life there nothing is known. His history of England extends from the fabulous Brutus to about 1300 A.D. The work is written in Anglo-Saxon, showing the transition stage of the language previous to Chaucer, and its chief value is linguistic. It is in verse, and contains upward of 10,000 lines and is filled with the most absurd fables. Numerous manuscripts prove its popularity. These are found in the Bodleian, Cottonian, Heralds' College, and other libraries. Thomas Hearne printed it at Oxford in 1724, but the best edition is that of Aldis Wright in the Rolls series (two vols. 1887). It is partly based on earlier works, is wholly destitute of originality and some have thought it a translation from the French.

Robert of Molesme, mō-lām, **Saint**, founder of the Cistercians: b. Champagne 1018; d. Molesme 1110. At 15 he became a Benedictine monk in the abbey of Montier-la-Celle, where on account of his high and religious character he was elected prior while still the youngest member of the community. He was afterward appointed abbot of Saint Michael de Tonnerre. He was induced to leave this abbey through the recalcitrancy of the monks. In Colan, however, a desert place near the abbey, there lived certain anchorites, and at their request he became their superior; they thence removed to the forest of Molesme, where they built themselves cells and an oratory dedicated to the Holy Trinity (1075). Here the community became relaxed in discipline through the bounteous contributions provided by the bishop of Troyes and others. Robert therefore left them and eventually settled with some devout members of the abandoned community at a place called Cistercium, or Cîteaux, five leagues from Dijon in the diocese of Chalons. They chose a spot in the uninhabited forest with the consent of Walter, bishop of Chalons, and Renand, viscount of Beaune, lords of the territory. The day of their establishment was Saint Bennet's Day, 21 March 1068, from which must be dated the foundation of the Cistercian Order. The rule established by Saint Robert allotted four hours for sleep, four for singing the offices, four for manual labor and four for study. Thus was the great, practical, and highly useful Cistercian Order founded: and it was presided over by Abbot Robert until his death.

Robert College, Constantinople, Turkey, so called after Christopher R. Robert of New York, its chief benefactor, was organized by James H. and William B. Dwight, sons of the Rev. Harrison G. O. Dwight, an American missionary to Turkey. It was opened in 1863, its financial support being guaranteed by the philanthropy of Mr. Robert who died in 1878, and whose total contributions to the institution amounted to \$450,000. In 1864 the college was affiliated to the University of New York. Its first president was the Rev. Cyrus Hamlin, D.D., who at his resignation in 1877 was succeeded by the Rev. George Washburn, D.D. The curriculum is similar to that of the average American college; while English is the principal language in use, instruction is also given in 13 other languages. The first home of the college was in a private house; the two college buildings built in 1871 and 1891 respectively occupy a fine site on the Bosphorus.

Robert Elsmere, a novel by Mrs. Humphry Ward, published in 1885. It is a brilliant example of the embodiment in a work of fiction of intellectual problems of contemporary interest and recounts the struggles of an Anglican clergyman who cannot accept all the miracles and dogmas of Christianity, while in deep sympathy with its spirit. The work had a phenomenal success, partly owing to the nature of its subject, and partly to its genuine literary merit. Aside from its intrinsic value, the sensation it produced entitles it to rank as one of the most remarkable books of its generation.

Robert-Fleury, rô-bâr flê-rî, **Joseph Nicolas**, French painter: b. Cologne 8 Aug. 1797; d. Paris 5 May 1890. In early life he studied under Gros at Paris, and after visiting the galleries and studios of Italy finally settled in the French capital. His works are distinguished for impressive characterization and profound sentiment; and among them may be mentioned: 'Night of Saint Bartholomew's' (1833); 'Religious Conference at Poissy in 1561' (1840); 'Jane Shore after her Condemnation Insulted by the People' (1850); 'Sack of a Jew's House at Venice in the Middle Ages' (1855); the last three are in the Luxembourg Museum. He also decorated with paintings the hall of the Chamber of Commerce at Paris.

Robert-Fleury, Tony, French painter: b. Paris 1 Sept. 1837. He was a pupil of Delaroche and Cogniet and is known for his historical and genre pictures, as well as for portraits. Among his best works are: 'Warsaw on 6 April 1861'; 'Scene During the Polish Insurrection'; 'The Old Women of the Piazza Ravona, Rome' (1867, in the Luxembourg); 'The Daughters of Danaus' (1873); 'Charlotte Corday at Caen in 1793' (1874); 'The Sack of Corinth' (1870, in the Luxembourg); and a ceiling picture in the Luxembourg 'The Apotheosis of French Sculpture.'

Robertson, E. H., English mining engineer: b. West Riding, Yorkshire, 1877. He was graduated from Christ Church, Oxford, in 1899, studied engineering at Rutherford College, Newcastle-on-Tyne, and in 1892 became demonstrator of mining at the University of Birmingham. He has also assisted in the studies and investigations connected with the Royal Coal Commission.

Roberts, Benjamin Stone, American soldier: b. Manchester, Vt., 1811; d. Washington, D. C., 29 Jan. 1875. He was graduated from West Point in 1835, and in 1839 became chief engineer in the construction of the Champlain and Ogdensburg railroad. He was assistant geologist of New York State in 1841, and in 1843 was admitted to the bar and engaged in law practice. At the outbreak of the Mexican War he re-entered the army with rank as lieutenant. He served at Vera Cruz, Cerro Gordo, Contreras, Churubusco, Matamoras and the Galajara pass, was promoted captain, received brevet rank of lieutenant-colonel, and at the close of the war was voted a sword of honor by the Iowa legislature. In 1861 he was commissioned brigadier-general of volunteers and served under General Pope as chief of cavalry in the Army of Virginia. He was present at Cedar Mountain and the second battle of Bull Run and at the close of the war was brevetted brigadier-general in the regular army. In 1866 he became lieutenant-colonel of cavalry and in 1868 accepted the chair of military science at Yale which he occupied until his retirement in 1870. He was the inventor of the Roberts breech-loading rifle.

Roberts, Benjamin Titus, American Methodist clergyman: b. Leon, Cattaraugus County, N. Y., 1823; d. Chili, N. Y., 27 Feb. 1893. He was graduated at Wesleyan University in 1848, joined the Genesee Conference of the Methodist Episcopal Church, but in 1860 was one of the seceders from that body who founded the Free Methodist sect, of which he became the first general superintendent. In the same year he began a monthly magazine called 'The Earnest Christian' and in 1865 founded the Cheeseborough Academy at North Chili, N. Y., serving as its president from 1869 until his death. He wrote: 'Fishers of Men'; 'Why Another Sect'; 'First Lesson in Money'; 'Ordaining Women.'

Roberts, Brigham Henry, American journalist and politician: b. Warrington, Lancashire, England, 13 March 1857. In the summer of 1866 he emigrated with his parents to Davis County, Utah. In 1878 he was graduated from the University of Utah, and soon afterward was called by the Mormon Church to its missionary service. After laboring for some years as a missionary he was elected to a high office in the church. He also engaged in journalism and was editor-in-chief of the Salt Lake *Herald*. In 1895 he was a member of the State Constitutional Convention. At the first State election he was the Democratic nominee for Representative to Congress, but was defeated. In 1898, however, he was elected by a large majority. His election created widespread agitation throughout the country, and on 25 Jan. 1900 the House of Representatives by an overwhelming majority voted to exclude him as constitutionally ineligible, as a polygamist, to a seat in that body. He is the author of 'The Gospel' (1888); 'Life of John Taylor' (1892); 'Outlines of Ecclesiastical History' (1893); 'Succession in the Presidency of the Church' (1893); 'A New Witness for God' (1895); 'Missouri Persecutions' (1900); 'The Rise and Fall of Nauvoo' (1900).

Roberts, Charles George Douglas, Canadian author: b. Douglas, near Fredericton, New

ROBERTS

Brunswick, 10 Jan. 1860. He was educated at the University of New Brunswick, in 1883-4 was editor of the Toronto 'Week'; in 1885-7 was professor of English and French literature in King's College (Windsor, N. S.); and was professor of economics and international law from 1887 until his resignation in 1895, since when he has lived in New York. His reputation was first made as a poet with a gift of melody, a clear and grave manner, and a particular felicity, noticeable in the Canadian school, in pictures of nature. Later, he became equally known for his prose work in 'The Heart of the Ancient Wood' (1900), and 'The Kindred of the Wild' (1902), the latter one of the most successful of imaginative treatments of wilderness life. The collection of short stories, 'Earth's Enigmas' (1896), also is marked by an interesting individual quality. Among Roberts' other volumes are: 'In Divers Tones' (1887); 'Ave: An Ode for the Shelley Centenary' (1892); 'Songs of the Common Day' (1893); 'The Raid from Beau-sejour' (1894); 'A History of Canada' (1897); 'The Book of the Native' (1897); 'The Forge in the Forest' (1897); 'By the Marshes of Minas' (1900); 'The Book of the Rose' (1903).

Roberts, David, English painter: b. Edinburgh 24 Oct. 1796; d. London 25 Nov. 1864. In 1818 from being a house painter he advanced to the profession of scene painter, and in 1821 painted scenery for the stage of Drury Lane, London. All this while he was studying drawing and oil painting, and in 1826 and 1827 he attracted attention by his pictures of Rouen and Amiens cathedrals. Later on he traveled in Spain, Morocco, Egypt, Palestine, Italy, Belgium, making drawings of great buildings and landscapes with picturesque edifices, and working them up into pictures. Among his works the following are the most noteworthy: the drawings from Spain for the 'Landscape Annual' (1835-8); and illustrations for the volume entitled 'The Holy Land, Syria, Idumea, Arabia, Egypt, and Nubia' (1842). His other pictures represent numerous interiors of churches; as St. Miguel at Xeres, Holy Nativity at Bethlehem, St. Jean at Caen, St. Paul at Antwerp, St. Peter's at Rome, the cathedrals of Milan and Seville. Among his religious historic pictures are 'Departure of the Israelites from Egypt' (1829); 'Ruins of the Great Temple at Karnac' (1845); 'Destruction of Jerusalem' (1849), which were followed by 'Rome' (1855); and 'Grand Canal at Venice' (1856). Roberts' style was essentially spectacular; he produced grand, broad effects, with magnificent architectural arrangements, to which the details are of course generally sacrificed.

Roberts, Ellis Henry, American financier: b. Utica, N. Y., 30 Sept. 1827. He was graduated from Yale in 1850 and in the following year became editor and proprietor of the *Utica Morning Herald*. He sat in the State legislature in 1867, was a member of Congress 1871-5, afterward continuing his editorial work until 1889, when he was appointed assistant treasurer of the United States. In 1893-7 he was president of the Franklin National Bank in New York, and since 1897 has been United States treasurer. He has published: 'Government Revenues' (1884); 'The Planting and Growth of the Empire State' (1887).

Roberts, Sir Frederick Sleigh Roberts, 1st EARL, English military officer, son of General Sir Abraham Roberts: b. Cawnpore, India, 30 Sept. 1830. He was taken to England at two and was educated at Clifton, Eton, the Royal Military College at Sandhurst, and at the East India Company's cadet college at Addiscombe. In December 1851 he was appointed 2d lieutenant in the Bengal artillery and in the following April sailed to join his company at Dum-Dum. A few months subsequently he became aide-de-camp to his father, then in command of the Peshawur division, and in November 1854 was posted to a troop of horse artillery on the north-western frontier. His ability secured for him a staff appointment as deputy assistant quartermaster-general and when the Punjab movable column was formed to quell the mutiny, young Roberts was chosen by Neville Chamberlain as his staff-officer, a position he likewise held under Chamberlain's successor, Nicholson. His first experience of actual warfare was at the siege of Delhi, where he was wounded, and in June 1857 he was promoted lieutenant. In September he left Delhi in command of a force bound for Cawnpore, and in the subsequent operations for the relief of Lucknow took an active share. At Khundaganj he rescued at the risk of his life a comrade hard pressed by the enemy, and then captured a standard guarded by two sepoys, for which services he was awarded the Victoria Cross. He participated in the re-establishment of English authority at Fategarh and at Lucknow, and in 1858-60 was on leave of absence to England. He returned to India in the latter year with rank as captain and brevet major, and served again under Sir Neville Chamberlain in the Umbeyla campaign of 1863. In the Abyssinian campaign in 1868 he served as assistant quartermaster-general, held a command in the Lushai expedition of 1871-2 and in 1872-5 was deputy quartermaster-general. He was promoted major-general in 1878 and on the outbreak of the Afghan war was assigned to command the Kuram field force. On 21 November he advanced into Afghanistan though without communication with India and wholly dependent upon a hostile country for supplies. Nine days later he forced the Afghan position at Peiwar Kotul, but further operations were suspended by the treaty of Gandamak. The murder of the British ambassador, Sir Louis Cavagnari, at Kabul, resulted in renewal of the war in 1879, and in October General Roberts again moved against the Afghans. He utterly defeated the forces of Yákúb Khan at Kabul, forced his abdication, sent him a prisoner to India, and then occupied with the British forces the fortified cantonment of Sherpur. In 1880 intelligence of the siege of the British garrison at Kandahar by Ayub Khan reached General Roberts and on 9 August he set out to the relief of the garrison with an army of 10,000 picked men. For three weeks the army was lost from the view of the world, but on 31 August Roberts reached Kandahar, gave battle to Ayub Khan, routed his army, and captured his artillery and camp. After the withdrawal of troops was effected he visited England, where he was enthusiastically welcomed and showered with honors. He was created a baronet, presented with the freedom of cities, received the thanks of Parliament and a special

medal was struck in honor of his march to Kandahar. In 1881 he was ordered to South Africa as governor of Natal and commander-in-chief against the Transvaal Boers, but peace was concluded before his arrival. He returned to India in November 1881, with rank as lieutenant-general in command of the Madras army, and in 1885 became commander-in-chief of India. In 1890 he received full rank as general and in 1892 was created a baron. He resigned his command in 1893 and returned to England, where he was appointed commander-in-chief of the forces in Ireland in 1895, sworn as a member of the privy council of Ireland, and later in the same year made field-marshal. After the disasters which had continuously beset the British arms in South Africa in 1899 at Stormberg, Magersfontein and Colenso, where Roberts' only son fell, the public turned their attention once more to the field-marshal and clamored for his appointment as commander. He arrived at Cape Town early in 1900 with Lord Kitchener as his chief of staff and at once proceeded to the relief of Kimberley. He captured General Cronje with a large share of his force at Paardeburg, then continued a steady fight until Ladysmith was relieved, and a forced march to Bloemfontein followed by the occupation of that post with British troops. Three months later came the second critical point in General Roberts' manipulation of the war. He made a rapid advance upon Johannesburg and Pretoria by way of Kroonstad and Vereeniging and though handicapped by short rations, opposed at almost every step of the way by the enemy, and with railway communication cut off, Roberts moved steadily upon the Boer capital, seized it, relieved Mafeking, annexed the two republics by proclamation, and in the latter part of 1900 declared the war ended. He then resigned his command and returned home. Parliament voted him its thanks and a gift of £100,000, he was advanced to the peerage as Earl Roberts of Kandahar, Pretoria, and Waterford, and Viscount Saint Pierre, and made commander-in-chief of the United Kingdom. In 1901 he became a member of the privy council. His only son having been killed at Colenso, the peerage will by special grant descend to his daughter. Lord Roberts is to the British army the ideal of a soldier, and by the rank and file is affectionately termed "Bobs." Added to his military skill is an inexhaustible capacity for detail, a quick grasp of possible alternatives, a tireless energy, and the power to command men and to infuse them with his own indomitable courage and determination. He has written: 'The Rise of Napoleon' (1895); and 'Forty-one Years in India' (1897).

HARRIET BRUNKHURST,

Editorial Staff, 'Encyclopedia Americana.'

Roberts, Howard, American sculptor: b. Philadelphia 1843; d. Paris 19 April 1900. He studied at the Pennsylvania Academy of Fine Arts, and in 1866 went to Paris and studied under Dumont and Gumery at the Ecole des Beaux Arts. In 1875 he established a studio in Philadelphia and at the Centennial Exhibition exhibited a statue, 'La Première Pose,' that created a sensation on account of its superior technical qualities. He received one of the three medals awarded to American sculptors.

Other works are 'Eleanor'; 'Hester Prynne'; 'Hypatia'; 'Lot's Wife,' nearly all being at the Pennsylvania Academy.

Roberts, John Bingham, American surgeon: b. 29 Feb. 1852. He was graduated at the University of Pennsylvania in 1871, and at the Jefferson Medical College in 1874. He is president of the Philadelphia County Medical Society, Medical Society of the State of Pennsylvania, and vice-president of the American Surgical Society. He is a contributor to medical and scientific papers and has published 'Paracentesis of Pericardium' (1880); 'Surgery of Human Brain' (1885); 'Fractures of Radius' (1897); 'Deformities of the Face' (1900); etc.

Roberts, Margaret, British novelist: b. Honyngs, North Wales, 1833. She has lived much on the Continent and wrote her first book in Italian. Her books, which have been published, for the most part, anonymously, include: 'Atelier d'Lys'; 'Mademoiselle Mori' (1860); 'Denise' (1863); 'Madame Fontenoy' (1864); 'On the Edge of the Storm' (1868); 'In the Olden Time' (1883); 'Under a Cloud' (1888); etc.; several of these have been much read in this country.

Roberts, Morley, English novelist and journalist: b. London 29 Dec. 1857. After study at Owens College, Manchester, he went, in 1874, to Australia, and there worked on railways in Victoria and as a sheep and cattle rancher in the New South Wales bush. Then he was before the mast in merchant ships, and after some experience in the quartermaster general's department of the British war office and in the India office, set out again traveling, visiting in 1884-6 many of the western United States, Canada, British Columbia, and Manitoba, and later the South Seas. His hardships and adventures have lent a certain element of vigor to his stories, which are better known in England than in the United States, and include: 'King Billy of Ballarat' (1891); 'The Reputation of George Saxon' (1892); 'Red Earth' (1894); 'The Degradation of Geoffrey Alwith' (1895); 'The Great Jester' (1896); 'The Circassian' (1896; with Max Montesole), an interesting book of Eastern life; 'The Keeper of the Waters' (1898); 'The Colossus' (1899), which, as giving a portrait of Cecil Rhodes (q.v.), was perhaps most talked of among Roberts' works; 'Immortal Youth' (1902); 'The Way of a Man' (1902), etc.

Roberts, Robert Richford, American Methodist bishop: b. Frederick County, Md., 2 Aug. 1778; d. Lawrence County, Ind., 26 March 1843. He removed with his family in 1785 to Ligonier Valley, Western Pennsylvania, and was brought up on the frontier. He obtained Methodist books, studied for the ministry, in 1802 was licensed to preach, served as an itinerant preacher for several years, and later was in charge of important pastorates in Baltimore and other cities. In 1816 he was elected bishop and soon after removed to Indiana. He did much for Indian missions and among the Indians he was known as "the grandfather of all the missionaries." Consult: Charles Eliot, 'Life of Bishop Roberts' (1853).

Roberts, William Charles, American Presbyterian clergyman: b. Aberystwyth, Wales, 23 Sept. 1832. He was graduated from Princeton

University in 1855 and from Princeton Theological Seminary in 1858. He was pastor of the First Presbyterian Church, Wilmington, Del., 1858-62, the First Presbyterian Church, Columbus, Ohio, 1862-4, and the Second Presbyterian and Westminster churches, Elizabeth, N. J., 1864-82. He was president of Lake Forest, Ill., University, 1886-92, and was moderator of the General Assembly of the Presbyterian Church 1889. He has published 'The Great Preachers of Wales' (1865); translation of 'Shorter Catechism into Welsh' (1867); 'New Testament Conversations' (1895).

Roberts, William Milnor, American civil engineer; b. Philadelphia 12 Feb. 1810; d. Brazil, South America, 14 July 1881. As early as 1831 he was senior principal assistant engineer on the Allegheny Portage railroad, and in 1835 he planned and built across the Susquehanna River at Harrisburg the first combined railroad and highway bridge in this country. During the next 20 years he was engineer or contractor on many American railroads and canals. In 1857 he went to Brazil and undertook the construction of the Dom Pedro II. railroad. During 1866-8 he was U. S. civil engineer in charge of improvements of the Ohio River; from 1868-70 associate contractor with James B. Eads in building the bridge across the Missouri at Saint Louis. In 1870 he became chief engineer of the Northern Pacific railroad, and in 1874 visited Europe on an observation tour of jetties as member of the commission of civil and military engineers to report on plans for the improvement of the mouth of the Mississippi River. In 1879 the emperor of Brazil appointed him on a commission of hydraulic engineers to report on harbors and rivers of Brazil, and in prosecution of these labors he died of a fever. He was president of the American Society of Civil Engineers in 1879.

Roberts-Austen, William Chandler, English metallurgist; b. 1843; d. 22 Nov. 1902. He was graduated at the Royal School of Mines, London, and became an assistant in the mint. In 1869 he was made assayer to the mint, and in 1882 was appointed queen's assay master. He had already, in 1880, been appointed professor of metallurgy at the Royal School of Mines, and held the two positions at the time of his death. He assumed the name of Austen in 1885. He was one of the founders of the Physical Society of London, of which he became vice-president; a member of the British executive council of the Paris Exposition of 1889; vice-president of the International Mining and Metallurgical Congress at Paris. He contributed papers mainly relating to metals to the 'Philosophical Transactions.'

Robertson, rōb'ert-sōn, Frederick William, English clergyman; b. London 3 Feb. 1816; d. Brighton 15 Aug. 1853. He was ordained in 1840; was graduated from Brasenose College, Oxford, in 1841; in that year he was made curate of Christ Church, Cheltenham; and from 1847 until his death was pastor of Trinity Chapel, Brighton. His eloquence was remarkable, and soon extended his renown far beyond local limits. He was an eclectic in theology, and declared for no party in a time when the clergy were generally partisans. His frequent dissent from various positions of the schools of thought, brought upon him numerous attacks, whose importance he was wont to overestimate. His views were colored by study of the Germans, and developed

considerably during the progress of his ministry. His mind was positive, original, and without fear; and his constant labor greatly affected his health. He was deeply interested in the workmen's institute, which he founded at Brighton, and whose work he made very effective. His 'Sermons' (1855-90), though derived from inadequate shorthand notes or from recollections prepared by himself, have been very widely read. His other important work has been collected in his 'Literary Remains.' Consult the 'Life and Letters' by S. A. Brooke (1865).

Robertson, Harrison, American journalist and author. He is associate editor of the Louisville *Courier-Journal*, Kentucky, and has written: 'How the Derby Was Won' (1889); 'If I Were a Man' (1899); 'Red Blood and Blue' (1900); 'The Opponents' (1902); etc.

Robertson, James, English royal governor of New York; b. Fifeshire, Scotland, about 1720; d. London, England, 4 March 1788. He entered the army and after various services sailed for America in 1756, was appointed major-general of the royal troops raised in America and barrack-master at New York. He commanded a brigade at the battle of Long Island in 1776 and after André's capture made an earnest effort to secure his release. In 1779 he was appointed royal governor of New York, and in 1782 received rank as lieutenant-general. He returned to England in the following year. His reputation was that of an avaricious and supercilious officer and in his position as governor he was charged with arbitrary measures.

Robertson, James, American pioneer; b. Brunswick County, Va., 28 June 1742; d. Chickasaw region, Tenn., 1 Sept. 1814. In 1769 he accompanied Daniel Boone (q.v.) on the latter's third exploration, and stopping at Watauga (now Elizabethton, Tenn.), planted corn. In 1770 he returned thither with a band of North Carolinian settlers. The settlement soon numbered some 200. Both North Carolina and Virginia asserted jurisdiction over it, but neither colony offered protection; and it was left an independent outpost of civilization. With John Sevier, Robertson became the head of the communities which gathered about the Holston and Watauga. In 1777 he was commissioned agent of North Carolina among the Cherokees, and during his residence of more than a year thwarted the British agent and kept at peace the great body of Cherokees and Creeks. With a party of settlers he set out in 1779 for the French Lick of the Cumberland, and on 25 December made the beginnings of a town on the site of Nashville, then 15 days' journey from the westernmost white confines. A fort built, a military organization was made, with Robertson as colonel. Troubles increased. Provisions were low, and the Indians hostile. He detached the Chickasaws and Choctaws from their English alliance and concluded a treaty with the Cherokees. He also defended the settlement against the Creeks, who were abetted by the Spanish authorities of Louisiana; and refused to organize a separate state in alliance with Spain. In 1790 Robertson was commissioned United States brigadier-general, and later he was government Indian agent. He was well fitted for his frontier career, and especially successful in his dealings with the savages. His favorite saying, "Man proposes, but God dis-

poses," he always insisted was somewhere in the Book of Job. Consult the 'Life' by Putnam (1859); Gilmore, 'The Rear Guard of the Revolution' (1886); and 'Harper's Magazine,' February 1888, pp. 420-6.

Robertson, James Burton, English historian: b. London 15 Nov. 1800; d. Dublin 14 Feb. 1877. He was educated at the Roman Catholic College of St. Edmund, near Ware, and was called to the bar in 1825. Later he studied literature, philosophy, and dogmatic theology in France. His first important publication was a translation of Frederick Schlegel's 'Philosophy of History' (1835). He lived in Germany in 1851-4, and here produced a translation of Möhler's 'Symbolism or Exposition of Doctrinal Differences Between Catholics and Protestants' (1843), a work which made a deep impression on the Tractarians. In 1855 J. H. Newman, then rector of the Catholic University at Dublin, called him to the chair of geography and modern history and later the department of English literature was assigned him. His original works comprise lectures 'On Subjects of Ancient and Modern History' (1859); 'On Subjects of Modern History and Biography' (1864); on the 'Writings of Chateaubriand, and on the Illuminati, Jacobins, and Socialists'; 'On the Life, Writings and Times of Edmund Burke' (1860), together with poetry and translations.

Robertson, James Craigie, Scottish clergyman: b. Aberdeen, Scotland, 1813; d. Canterbury, England, 9 July 1882. He was graduated from Cambridge in 1834, and took orders in the Anglican Church, in 1836. He was made canon of Canterbury in 1859, and from 1867-74 was professor of ecclesiastical history at King's College, London. He published: 'How Shall We Conform to the Liturgy' (1843); 'Church History' (1852-73); 'Plain Lectures on the Growth of Papal Power' (1876); edited Heylyn's 'History of the Reformation' (1849); 'Materials for the History of Archbishop Thomas Becket' (1875-82); etc.

Robertson, James Logie, Scottish educator and author: b. Milnathort, Kinross-shire, 18 Sept. 1846. He was educated at Edinburgh University, and has been first English master at Edinburgh Ladies' College from 1891. He has published several volumes of pleasing verse, 'Horace in Homespun' (1886); 'Ochil Idylls' (1896); 'Adaptations from Dunbar' (1895); etc., while among his prose works may be cited 'In Scottish Fields' (1890); 'A History of English Literature' (1894). He has also edited editions of Scott (1894) and Burns (1896); 'The Select Chaucer' (1902); etc.

Robertson, Morgan, American author: b. Oswego, N. Y., 30 Sept. 1861. He was educated in the public schools and at Cooper Institute; went to sea in 1877-86 and then engaged in business as a jeweler. He has published: 'A Tale of a Halo' (1894); 'Spun Yarn' (1898); 'Where Angels Fear to Tread' (1899); 'Shipmates' (1901); 'Down to Sea' (1903); 'Down to the Sea' (1905).

Robertson, Thomas William, English actor and dramatist: b. Newark on Trent, 9 Jan. 1829; d. London 3 Feb. 1871. He came of a theatrical family and played his first part at the age of four. He had a varied career as actor, newspaper writer, adapter of plays, as well as dramatist, in none more than successful enough

to gain a bare subsistence until he wrote 'David Garrick,' produced by E. A. Sothorn in 1864. This piece has taken a permanent place on the English stage. Following this a play called 'Society' had a long and successful run, making the fortunes of the Prince of Wales Theatre and the author. At the same house were produced his most successful series of plays, including 'Ours,' 'Caste,' 'Play,' 'School,' and 'M. P.' Some of these, especially 'Caste,' his masterpiece, are revived from time to time. His comedy was artificial, with a strong sentimental interest; but he was a good observer of manners and drew his characters from the life. He established a distinct school, and has had several followers, though in the best exponents of the later English dramas he has been replaced by writers whose methods are less artificial and hence more logical. His 'Principal Dramatic Works' were published with a memoir by his son in 1889. Consult also Pemberton, 'Life and Writings of T. W. Robertson' (1893); Cook, 'Nights at the Play' (1883); Clement Scott, 'The Drama of Yesterday and To-day' (1899).

Robertson, William, Scottish historian: b. Borthwick, Midlothian, 19 Sept. 1721; d. near Edinburgh 11 June 1793. After the completion of his course in Edinburgh University, Robertson obtained a license to preach in 1741, and in 1743 was presented to the living of Gladsmuir, in East Lothian. His 'History of Scotland During the Reigns of Queen Mary and King James VI.' appeared in 1759, and was received with general applause, though modern research has deprived it of most of its historical value. This work, which reached a 14th edition before the author's death, led to his nomination to the chaplaincy of Stirling Castle in 1759, as one of the king's chaplains in 1761, and as principal of the University of Edinburgh in 1762. The year after he was made historiographer-royal of Scotland, with a salary of £200 per annum. His 'History of the Reign of Charles V.' appeared in 1769, and his 'History of America' in 1777. His latest work appeared in 1791, under the title of a 'Historical Disquisition Concerning the Knowledge which the Ancients Had of India, and the Progress of Trade with that Country Prior to the Discovery of the Cape of Good Hope.' Consult: 'An Account of the Life and Writings of William Robertson' (1801-2); Gleig, 'Life and Writings of William Robertson' (1812); Graham, 'Scottish Men of Letters in the 18th Century' (1901).

Robeson, rōb'son, George Maxwell, American politician: b. Oxford, Warren County, N. J., 1829; d. Trenton, N. J., 27 Sept. 1897. He was graduated at Princeton University in 1847, and three years later was admitted to the bar. In 1867 he was appointed attorney-general of New Jersey, and during the two administrations of President Grant (1869-77) was secretary of the navy. He was a successful candidate for Congress in 1878 and 1880, and on retiring from Congress in 1883 resumed his law practice in Trenton, N. J.

Robeson, Henry Bellows, American naval officer: b. New Haven, Conn., 5 Aug. 1842. He was graduated from the United States Naval Academy in 1860, entered the navy as midshipman, and in 1862 was promoted lieutenant. He was engaged in the attack on Charleston, S. C., 7 April 1863, and later in the same year led a

ROBESPIERRE

party from the New Ironsides in the capture of the Confederate works at Morris Island. He participated in both attacks on Fort Fisher, was advanced to be lieutenant-commander in 1866 and commander in 1874. He was made commodore in 1898 and in 1899 was retired with rank as rear-admiral.

Robespierre, rō-bēs-pē-ār or rō'bēs-pēr, **Maximilien Isidore François Marie**, French revolutionist: b. Arras 6 May 1758; d. Paris 28 July 1794. He was the son of an avocat and having been left an orphan at 11 was sent by his grandfather to the college of his native town, from which he passed in 1770 to the Collège Louis-le-Grand at Paris on a scholarship given him by the Bishop of Artois. After pursuing the study of law with great distinction, he returned, in 1781, to Arras, where he adopted the profession of avocat. Solid, rather than brilliant, he quickly became known as a skilful lawyer and a man of unimpeachable integrity. With growing success he gave much of his time to the dilettante pursuit of literature, wrote essays in competition for prizes offered by the provincial academies and was a prominent member of the Rosati, a society devoted to the cultivation of wit and letters. He was an ardent student of Rousseau and a fanatical believer in the teachings of the Genevan philosopher; indeed Robespierre's unwavering convictions in the possibility of realizing Rousseau's ideal society explains his course in the days when he stood forth as the greatest figure in France, and gives the secret of his temporary success. In the events leading up to the election of the States-General Robespierre appeared prominently as the champion of the liberal views then so widespread among the French bourgeoisie. He was elected fifth deputy to the States-General from Artois, and allied himself with the radical faction in that body. In the constituent assembly he spoke frequently and always in the spirit of that equality which he believed was now at length to be established in France. Of small stature and by no means robust health, weak-voiced and pale-eyed, he did not impress himself on the mass of the assembly, but those who came into personal contact with him were gained over by his tremendous sincerity, and Mirabeau said of him: "That young man believes what he says; he will go far." Robespierre's great strength, however, was in the club of the Jacobins, where his polished, classical declamations gained him the ardent support of those members who had been recruited from among the working classes and the small bourgeoisie of Paris. His power in the club became absolute when the more conservative members seceded in 1791, after the more radical faction, under the inspiration of Robespierre, had prepared the petition for the deposition of Louis XVI., which led to the massacres in the Champ de Mars on 17 July. His popularity was demonstrated on the day of the dissolution of the National Assembly, 30 Sept. 1791, when Robespierre and Pétion were drawn in triumph through the streets of Paris, and crowned as "incorruptible patriots" by the people. In accordance with his own motion, adopted in May 1791, prohibiting members of the constituent assembly from sitting in the succeeding legislature, Robespierre took no direct part in the sessions of that body, but he continued to wield great

influence over its deliberations through his power in the Jacobine. In February 1792, he became public prosecutor at Paris, but resigned the office in April on account of the virulent attacks of the Girondists, who regarded him with special hatred because of his opposition to their favorite policy of war against Austria. Robespierre's opposition to the war was based on humanitarian grounds; he was, besides, a man of theories and not of action, and this would explain the little share he took in the uprisings of 20 June and 10 August, which, under the guidance of Danton, effected what Robespierre was quite pleased to see consummated, the overthrow of the Bourbon monarchy. Shortly after the storming of the Tuileries, Robespierre became a member of the Paris Commune; his personal popularity lent strength to that body, but his inability to prevent the prison massacres of September showed that his power was by no means absolute in the ranks of the radical party.

In the Convention to which he was elected as the first deputy from Paris, Robespierre became the leader of the Mountain. The Girondists turned the full force of their eloquence against him, and accused him of aiming at the dictatorship. In the crisis which attended the trial of Louis XVI., Robespierre for once assumed a firm and definite line of action. He pleaded for the death of the king and by so doing gained over to his side the party of Danton, Carnot and Bellaud-Varenne, who were disgusted by the temporizing policy of the Girondists at a time when France was in imminent danger of foreign invasion and needed a strong government to make headway against her enemies. The condemnation of Louis XVI. was a triumph for Robespierre, who, however, did not cease from his attacks on the Girondists. The struggle became one of life and death. In April, Robespierre denounced them in the body of the Convention, and on the fateful days of 31 May and 2 June the destruction of the party was accomplished with the aid of the Parisian mob. (See GIRONDIST.)

In July 1793, Robespierre was made a member of the Committee of Public Safety, which for a year was to be the virtual ruler of France. To curb dissension at home, so as to present a united front to the foreign foes of the country, the committee organized the Terror with which the name of Robespierre has become, through legend, synonymous. To the world at large Robespierre appeared as the master of the committee and the ruler of France. As a matter of fact, his power was in no way absolute. Of the 12 members of the committee, the majority were quite opposed to his Rousseauian ideals and only two of the 12, Couthon and St. Just, were professed followers of Robespierre. The rest of the committee were practical men of affairs, like Carnot, Bellaud-Varenne, or Collot d'Herbois, upon whose shoulders fell the real task of government. Robespierre's services to the committee were such as his immense popularity and spotless reputation could render it. He was the apologist for the committee in the Convention and before the people, but he differed from his associates entirely so far as the motives of his action are concerned. While the Terror to them was but a thorough, though possibly radical, means for establishing peace within the country, Robespierre saw in the Terror an effective

instrument for bringing about the erection of Rousseau's ideal state, by wiping out all opposed to his favorite theories. He first turned against Hébert (q.v.) and his followers in the Paris Commune, who had aroused his enmity by their uncompromising democracy, in their display of which they were guilty of the most ridiculous excesses, and their professed atheism, which attained its climax in the establishment of the worship of Reason by Chaumette (q.v.). The Hébertists were brought to the scaffold on 24 March 1794, and they were followed by Danton, Camille Desmoulins and their followers on 5 April. On 13 April came the turn of Chaumette. Danton fell because he had begun to advocate a moderation of the Terror and thereby had incurred the enmity both of the men of action on the Committee of Safety and of Robespierre, to whom alike the continuance of the Terror seemed essential. To hasten the work Robespierre caused the infamous law of the 22 Prairial (10 June) to be proposed by Couthon, whereby the revolutionary tribunal was freed from all restrictions of legal procedure, and thus improved sent nearly 1,300 persons to the scaffold between 12 June and 28 July.

On 8 June Robespierre attained the zenith of his career, when, as president of the Convention, he celebrated with great pomp the Feast of the Supreme Being, whose existence had been formally admitted by the Convention in the preceding month. His fall followed speedily. The men on the Committee of Safety who had suffered his official leadership as long as he was content to remain largely a figure-head, turned upon him when he began seriously to assert mastery over the committee. Besides, it became apparent that the excesses of the Terror could not go on, and that reparation would be demanded, and Robespierre was chosen as the scapegoat of the committee. The attack on Robespierre began 17 June, when Vadier, a member of the committee of general security, satirized him before the Convention. Instead of joining battle, as he was urged to do, Robespierre went into retirement for more than a month to prepare his defense. On 26 July he appeared in the Convention and declared that the Terror should cease, and that the committees of public safety and general security should be reorganized. Ominous threats appeared in his oration, which for a time held the Convention terror-stricken, and caused it to vote his proposition. Quickly, however, he was assailed by various orators, the Convention reconsidered its action, and in the session of the following day, the 27 July, the fateful 9th Thermidor, the secret intrigues of his associates on the committee, the fear of his intended victims and the resentment of the Dantonists, who had not forgotten the death of their leader, fell upon Robespierre. His arrest was ordered and with him that of St. Just, Couthon, Lebas, and his younger brother, Augustin Robespierre. Rescued by the national guards under Henriot, and brought to the Hôtel de Ville, the great Terrorist showed no capacity for action. The Convention placed him outside of the law, and despatched a portion of the national guard under Barras against him. In the assault Robespierre was shot in the jaw by a gendarme and taken in a pitiful condition to prison. On the following day he was brought before the revolutionary tribunal and with Couthon and St. Just and

others of his followers was sent to the guillotine. Consult: Aulard, 'La Société des Jacobins' (1891); Hamel, 'Vie de Robespierre' (1865-7), the principal authority; Belloc, 'Robespierre' (1902); Morse-Stephens, 'Principal Speeches of the Orators and Statesmen of the French Revolution' (1892).

Robin, a name originally applied in England to the red-breast (q.v.), a bird so familiar and so dear to the English heart that loyal colonists in many parts of the world have felt impelled to transfer the name to native species, which often resemble the original in little but the ruddy breast. The American robin is a true thrush (*Merula migratoria*) of the family *Turdidae*, and is found in summer throughout North America from Alaska to Virginia. Robins retire from higher latitudes only as their food begins to fail, or when driven south by inundating snows. During the winter months they are numerous in the Southern States, but even as far north as Boston robins are sometimes seen assembling round the open springs wherever berries may be found in the depth of winter. In the New England and the Middle States the robin is perhaps the most abundant breeding bird. Their nests of mud and grass are often seen on the horizontal branch of an apple tree, or in a shade tree, especially evergreens. The eggs, about four, are of a pale bluish-green, and without spots. They raise several broods in a season.

Robins feed upon insects, ripe cherries and other small fruits, but are especially fond of earthworms, which they extract from their burrows in the early morning and late afternoon with the greatest skill and industry, and of which they devour vast quantities. In spite of the fact that fruit growers consider them harmful, the cheery whistle and vivacious manners of the robin are rapidly gaining for it a place in popular esteem analogous to its English namesake. Unfortunately there are still parts of the country, and particularly of the South, where a sordid interest leads to the slaughter of great numbers of robins for the pot. In North Carolina they are killed at night in their roosting places. On the Pacific coast the robin varies to the sub-species *propinqua*, and in lower California a distinct species (*M. confinis*) occurs. *Hesperocichla nevada* is sometimes called the Oregon robin.

Robin Adair, a-dār, or **Eileen Aroon**, a familiar air, which, with the original words, was written, tradition says, by one Carroll O'Daly, an Irishman, of Elizabeth's time. However that may be, it was first popularized in England in the latter 18th century by Tenducci, an original singer in Dr. Arne's 'Artaxerxes.' Tenducci probably learned it in Ireland; at least it is known that he sang 'Eileen Aroon' with Irish words which had been phonetically arranged for him. The 'Robin Adair' form obtained currency through its rendering by Brahms at his benefit in London in 1811. Brahms's version was introduced by Boildieu into the latter's opera of 'La Dame Blanche.' Beethoven made a trio arrangement of it, with accompaniment by pianoforte, violin and cello.

Robin Goodfellow. See PUCK.

Robin Hood. See HOOD, ROBIN.

Robin Snipe, the red-breasted sandpiper or knot (*Tringa canutus*) in its summer plumage. This is among the largest of the sand-

pipers, and is distinguishable by the long, perfectly straight beak combined with the absence of webbing from between the toes, the middle one of which is much shorter than the tarsus. It is upward of 10 inches long and stoutly built, with rather short stout legs. In breeding plumage the entire under parts are reddish brown, and the autumn young, which are abundant during the gunning season, have the breast and belly whitish tinged with red, and the back very characteristically marked with white and black semicircles. Such seasonal changes in coloration are unusual among the *Scolopacidae*. The knot is nearly cosmopolitan, breeding in high northern latitudes and wintering in the southern hemisphere. It passes through the United States in April and May, and again more leisurely in August to October, frequenting the seashore in small flocks, and, less commonly, the large rivers and lakes of the interior. Its habits are similar to those of the other sandpipers (q.v.), with which it associates. Because of its large size it is a favorite with gunners, among whom it is known in the autumn plumages as the gray-back.

Robins, rōb'inz, Benjamin, English mathematician: b. Bath 1707; d. Fort Saint David, Coromandel coast, India, 29 July 1751. He early became known as a mathematician of unusual ability, and in 1728 published a confutation of the veteran Johann Bernoulli (q.v.), who had attempted a defense of Leibnitz's theory as to the laws of motion relative to bodies impinging on one another. After some time spent as a private instructor in mathematics and physical science, he turned engineer, and made particular study of fortifications and gunnery. He published in 1742 his 'New Principles of Gunnery,' which he had undertaken by way of furthering his unsuccessful candidacy for the professorship of fortification at Woolwich. It was translated into German and French, and has been regarded as the starting point of the modern scientific study of the matter. Much of it was derived from personal experiment with gunpowder. In 1749 he was made engineer-general to repair the forts of the East India Company. He wrote several political pamphlets, which brought him into some notice. In 1761 'Mathematical Tracts,' containing the 'Principles of Gunnery,' appeared under the editorship of James Wilson. There were subsequent editions. Consult the memoir by Wilson in this collection.

Robins, Edward, American author: b. Pau, France, 2 March 1862. He was educated at a military academy in Philadelphia, and in 1883 engaged in newspaper work. He was on the editorial staff of the Philadelphia *Public Ledger* in 1884-8, 1895-7, and has since devoted himself to authorship. He has published, besides several juvenile works, 'Echoes of the Play House' (1895); 'Twelve Great Actors' (1900); 'Romances of Early America' (1902); etc.

Robins, Elizabeth. See PARKES, ELIZABETH ROBINS.

Robinson, rōb'in-sōn, Agnes Mary Frances. See DARMESTER, AGNES MARY FRANCES ROBINSON.

Robinson, Albert Gardner, American journalist: b. Winchester, Mass., 21 Feb. 1855. He was engaged in commercial pursuits in 1871-98, but in 1898 became special war correspondent for the New York *Evening Post* in Cuba and Porto

Rico. He subsequently went to the Philippines and South Africa in the same capacity. He has published 'The Porto Rico of To-day' (1899); 'The Philippines—the War and the People' (1901); 'Historical Review of the Period of Intervention in Cuba'; etc.

Robinson, Beverley, American Loyalist soldier: b. Virginia 1723; d. Thornbury, England, 1792. He was a major under Wolfe at the taking of Quebec in 1759, and at the commencement of the Revolution was a large landed proprietor on the Hudson. He was opposed to the measures of the British ministry respecting the colonies, and abandoned the use of imported merchandise. Nevertheless, he remained loyal, and reluctantly entered the military service of the crown. The Loyal American regiment was recruited largely by him, and he was made its colonel. He was connected with the negotiations preliminary to Benedict Arnold's treason; and at the time Arnold was occupying as headquarters Robinson's country-seat. At the conclusion of the war he went to New Brunswick, where his name appears as a member of the first council, though he never took his seat; and thence to England. He lost his property by confiscation, and by way of compensation received £17,000 from the English government. Consult: Ryerson, 'The Loyalists of America and Their Times' (1880).

Robinson, Charles Mulford, American author: b. Ramapo, N. Y., 30 April 1869. He was graduated from the University of Rochester in 1891, was editor of the Rochester *Post-Express* in 1891-1902, and has published: 'The Improvement of Towns and Cities' (1901); 'Modern Civic Art' (1903); etc.

Robinson, Charles Seymour, American Presbyterian clergyman and hymnologist: b. Bennington, Vt., 31 March 1829; d. New York 1 Feb. 1899. He was graduated from Williams College in 1849, studied at Union Theological Seminary and at Princeton, and was ordained in the ministry in 1855. He held a pastorate in Troy 1855-60, and thereafter was pastor of various churches in New York with the exception of 1868-70, when he had charge of the American Chapel, Paris, France. He published several volumes of sermons and other works, and is widely known as a collector of hymns. His publications include: 'Songs of the Church' (1862); 'Church Work' (1873); 'The Pharos of the Bondage and the Exodus' (1887); 'New Laudes Domini' (1892); 'Annotations on Popular Hymns' (1893); 'Simon Peter: Later Life and Labors' (1894); etc.

Robinson, Edith, American novelist: b. Massachusetts 1858. Her literary work is partly of a juvenile character and includes: 'Forced Acquaintances' (1887); 'A Little Puritan Rebel' (1898); 'A Little Puritan Pioneer' (1901); 'A Puritan Knight Errant' (1902); etc.

Robinson, Edward, American Biblical scholar: b. Southington, Conn., 10 April 1794; d. New York 27 Jan. 1863. Graduated from Hamilton College in 1816, he went in 1821 to Andover to publish his edition of books, i.-ix., xviii., and xix. of the 'Iliad,' there aided Moses Stuart (q.v.) in the preparation of the second edition (1823) of the latter's 'Hebrew Grammar,' and rendered into English (1825) Wahl's 'Clavi

Philologica Novi Testamenti.' After European study, largely in Halle and Berlin (1826-30), he was professor extraordinary of sacred literature in the Andover Theological Seminary in 1830-3, and professor of Biblical literature in Union Theological Seminary from 1837 until his death. In 1838 and 1852 he visited Palestine with the scholarly missionary, Eli Smith (q.v.), and there made careful surveys and investigations. His chief work, 'Biblical Researches' (1841; 3 vols. compressed into 2, with a 3d 1856), which obtained for him the Royal Geographical Society's gold medal, was based on these studies. He was a leading member of the American ethnological, geographical and Oriental societies, and edited in 1831-4 the 'Biblical Repository,' in 1843 the 'Bibliotheca Sacra,' with which the 'Repository' was incorporated, and for which he continued to write until 1855. Among his other publications are: 'A Dictionary of the Bible' (1833); editions of Buttmann's 'Greek Grammar' (1833; 3d ed. 1851) and Gensenius' 'Hebrew Lexicon' (1836; 5th ed. 1854); and Greek (1845; 2d ed. 1851) and English (1846) harmonies of the Gospels. Consult: Hitchcock, 'Life, Writings and Character of Edward Robinson' (1863).

Robinson, Edward Arlington, American poet: b. Head Tide, Maine, 22 Dec. 1869. He was educated at Harvard and has published 'The Torrent and the Night Before' (1896); 'The Children of the Night' (1897); 'Captain Craig' (1902), collections of verse which display much promise.

Robinson, Sir Frederick Philipse, English soldier: b. near New York Sept. 1763; d. Brighton, England, 1 Jan. 1852. He became ensign in 1777 in a Royalist American regiment, raised by his father, and fought in the battles of Horse-neck, Stony Point and New London. He returned to England in 1784; entered the West India service in 1793 and was present at the capture of Martinique, St. Lucia and Guadeloupe. He became colonel in 1810, and commanded a brigade in the Peninsula campaign of 1813, where he fought gallantly; was promoted major-general in 1814 and rewarded with a medal. He took part in the engagement before Plattsburg in 1814 during the war with the United States, and in 1816 left Canada for the West Indies, where he was put in command of the troops in the Windward and Leeward Islands and for a time was governor of Tobago. At the time of his death he was the soldier of longest service in the British army.

Robinson, Frederick William, English novelist: b. London 23 Dec. 1830; d. there 6 Dec. 1901. He was educated at Clarendon House, Kennington, and in 1851 began his career as a novelist, though he frequently contributed special articles to periodicals and for five years wrote dramatic criticisms for the *Daily News*. He founded and edited 'Home Chimes,' which ran as a weekly two years and then became a monthly. He was a prolific writer and over 50 titles of novels stand to his credit. Some of them are as follows: 'The House of Elmore' (1855); 'One and Twenty' (1858); 'No Church' (1861); 'Female Life in Prison' (1862); 'A Woman's Ransom' (1864); 'Beyond the Church' (1866); 'Stern Necessity' (1870); 'Her Face Was Her Fortune' (1873); 'Second Cousin Sarah' (1874); 'The Romance

of a Back Street' (1878); 'Lazarus in London' (1885); 'The Keeper of the Keys' (1890); 'The Secretary' (1895); 'Sweet Nineteen' (1896). His skilfully constructed and fluently told fictions were as popular in this country as in his own.

Robinson, Henry Crabb, English barrister and diarist: b. Bury St. Edmunds 3 May 1775; d. London 5 Feb. 1867. In 1796 he entered a solicitor's office in London, and in 1800 went to Germany, where he spent five years in studying at Jena and elsewhere, and in making the acquaintance of Goethe, Schiller, Wieland, Herder, Kotzebue, and other noted Germans. In 1807 he went to Altona as *Times* correspondent, and in 1808-9 was war correspondent in Spain for the same newspaper. He was called to the bar in 1813, and practised until 1828. He was associated with the foundation of the University of London in 1828. His fame as a conversationalist approached that of Rogers, but he never made any serious attempt to gain distinction as a writer. His intimate acquaintance with many of the greatest men and women of his time, both in his own country and on the Continent, gives peculiar interest and value to the selections from his 'Diary, Reminiscences, and Correspondence,' edited by Sadler in 1869.

Robinson, John, English Independent clergyman: b. Lincolnshire about 1576; d. Leyden, Holland, 1 March 1625. It has been widely assumed that he was educated at Corpus Christi College, Cambridge. He was, say certain later writers, suspended from a benefice in Norfolk. He himself mentions a residence in Norwich, where he was religious director of a band of worshippers, and where certain persons were excommunicated for their interest in his instruction. In 1608 he emigrated to Amsterdam, with several of the congregation of the church at Scrooby Manor, Nottinghamshire, and thence in 1609 to Leyden, where he was ordained pastor, with William Brewster (q.v.) as ruling elder. In 1611 a building was purchased for 8,000 guilders for use as a meeting-house. Mather in his 'Magnalia' says that "those famous divines, Polyander and Festus Hommius, employed this our learned Robinson to dispute publicly in the University of Leyden against Episcopius, and the other champions of that grand choke-weed of true Christianity" (Arminian doctrine). There may be some foundation for the story of such a disputation; but it was probably not at Polyander's request, nor at the university, where Episcopius was in power. Robinson was admitted to the university in 1615, and attended Episcopius' lectures. He took a very active interest in the project for emigration to America; and had a majority of his church volunteered, would have accompanied them hither. Previous to the sailing of the *Speedwell*, he preached on 21 July 1620, observed as a day of prayer and humiliation. His celebrated address is given in Winslow's 'Hypocrisie Unmasked' (1646), the author remarking that Robinson "used these expressions, or to the same purpose," and some allowance must be made for such improvements and embellishments as Winslow may have made to suit his controversial purpose. Robinson corresponded with the "church of God at Plymouth, New England." Mather calls him "a most wise, grave, good man," and Robert Baillie, "the most learned, polished, and modest spirit" among

the separatists. His 'Works,' with memoir and notes of Robert Ashton, appeared in 1851. Consult also: Bradford, 'History of Plymouth Plantation' (Coll. of the Mass. Hist. Soc., 4th ser., Vol. III., 1856); Mather, 'Magnolia' (1702); Neal, 'History of New England' (1720); Brook, 'Lives of the Puritans' (1813); Dexter, 'Congregationalism of 300 Years' (1880); 'Life' by Davis (1903).

Robinson, John Cleveland, American soldier: b. Binghamton, N. Y., 10 April 1817; d. there 18 Feb. 1897. He entered West Point in 1835, but withdrew in 1838 to study law, accepting, however, a commission as 2d lieutenant in 1839. He was engaged in the Mexican and Seminole wars, was promoted captain in 1850 and at the outbreak of the Civil War was commissioned colonel of volunteers. He was in command of Fort McHenry at the opening of the war; successfully defended it, and was later engaged in organizing volunteer troops. He commanded a brigade in the Army of the Potomac in the Seven Days' battle before Richmond; was present at the battles of Fredericksburg, Chancellorsville, Gettysburg, Wilderness, and Spottsylvania, and in the last lost a leg and was prevented from further active service. He was voted a medal of honor by Congress; was brevetted major-general of volunteers in 1864, and of regulars in 1865. In 1866 he was mustered out of the volunteer service and accorded rank as colonel in the regular army. He was in command of the Department of the South in 1867, of the Lakes in 1868-9, and in the latter year was retired with rank of major-general. He was elected lieutenant-governor of New York in 1872, was commander-in-chief of the G. A. R. in 1877-8, and president of the Society of the Army of the Potomac in 1887-8.

Robinson, Joseph Armitage, English Anglican clergyman. He was educated at Cambridge, took priest's orders in the Established Church in 1882 and was vicar of All Saints, Cambridge, 1888-92. From 1893 to 1899 he was Norrisian professor of divinity at Cambridge, and was prebendary of Wells' Cathedral 1894-99. He was rector of St. Margaret's Westminster, 1899-1900, canon of Westminster 1899-1902, and in the year last named succeeded Dean Bradley as dean of Westminster Abbey. He has published 'A Collation of the Athos Codes of the Shepherd of Hermas' (1888); 'Appendix to the Apology of Aristides' (1891); 'The Passion of St. Perpetua' (1891); 'The Philocalia of Origen' (1893); 'Euthaliana' (1895); 'Unity in Christ' (1901).

Robinson, Lewis Wood, American naval officer: b. Camden County, N. J., 7 March 1840; d. Philadelphia, Pa., 16 Feb. 1903. He was graduated from the Polytechnic College of Pennsylvania in 1861, and entered the navy in that year as 3d assistant engineer in the West Gulf blockading squadron. He participated in the capture of Fort Jackson, Fort Saint Philip, and New Orleans; was engaged in the attack on Vicksburg and in the battle of Mobile Bay. After the war he continued in the naval service, was appointed chief engineer with rank of lieutenant-commander in 1883, became commander in 1895, captain in 1898 and in 1901 was retired with rank of rear-admiral.

Robinson, Philip (Stewart), English journalist: b. Chunar, India, 1849. He was educated

at Marlborough College, engaged in teaching and in journalism, and was special correspondent of the London *Daily Telegraph* in the Afghan and Egyptian wars. He was also special commissioner of the New York *World* in 1881-2, and during the Spanish-American war was in Cuba as correspondent of the *Pall Mall Gazette*. He has published: 'In My Indian Garden' (1878); 'Sinners and Saints' (1883); 'Some Country Sights and Sounds' (1893); 'Birds of the Wave and Woodland' (1894); 'In Garden, Orchard and Spinney' (1897); etc.

Robinson, Stillman Williams, American engineer and inventor: b. Reading, Vt., 6 March 1838. He was graduated from the University of Michigan in 1863, and for the three following years became assistant engineer in the United States Lake Survey. In 1866 he became attached to the University of Michigan in the department of geodesy and mining, and in 1870 was made professor of mechanical engineering at the University of Illinois, where he remained until 1878, when he assumed a similar post at the Ohio State University, and continued in its active duties until made professor emeritus in 1894. He has been an active inventor, and controls at least 40 patents. He invented the thermometer-graduating machine, and machines for shoe manufacturing, and has published: 'Teeth of Great Wheels and the Robinson Templet Odontograph' (1876); 'Railroad Economics' (1882); 'Strength of Wrought Iron Bridge Materials' (1882); 'Compound Steam-Pumping Engines, Analytical and Graphical Treatment' (1884); 'Principles of Mechanism' (1896); etc.

Robinson, Stuart, American Presbyterian clergyman: b. Strabane, near Londonderry, Ireland, 26 Nov. 1816; d. Louisville, Ky., 5 Oct. 1881. He was graduated at Amherst College in 1836, studied theology at Union Seminary, Prince Edward, Va., and was ordained in 1841. He was pastor at Kanawha Salines, W. Va., 1841-7, in 1856-8 professor of ecclesiology in the Presbyterian Seminary at Danville, Va., and then became pastor at Louisville. He edited the 'True Presbyterian,' which was suppressed by the government in 1862 for disloyalty, and he then removed to Toronto. In 1865 he published 'Slavery as Recognized by the Mosaic Civil Law, and Allowed in the Abrahamic, Mosaic, and Christian Church,' and in 1866 resumed his Louisville pastorate and reissued his paper as 'The True Christian Commonwealth.' His persistence in expressing his former views led to his expulsion from the Presbyterian general assembly, and by his influence the Kentucky synod joined the Southern general assembly in 1869, which body made him its moderator. He was a delegate to the Pan-Presbyterian council at Edinburgh in 1877. He wrote: 'The Church of God an Essential Element of the Gospel' (1858), and published 'Discourses of Redemption' (1866).

Robinson, Theresa Albertine Louise von Jakob, German-American author: b. Halle, Prussia, 26 Jan. 1797; d. Hamburg 13 April 1869. She was the second wife of Edward Robinson (q.v.), and was known in Germany as an author under the name of 'Talvj' (formed from her initials. While residing at Kharkoff she began to study Slavonian, and wrote her

first poems. In 1825 she published a few tales in a volume bearing the title 'Psyche.' She also published, in 1825-6, translations of a number of Servian popular songs entitled 'Volkslieder der Serben.' In America she began the study of the aboriginal languages, and translated into German Pickering's work on the Indian tongues. In 1834 she wrote a 'Historical Review of the Slavic Languages' for the 'Biblical Repository,' republished in enlarged form in 1850. During her husband's visit to Palestine she resided in Germany, where she published, in 1840, 'Charakteristik der Volkslieder germanischer Nationen mit einer Uebersicht der Lieder aussereuropäischer Völkerschaften.' 'Die Colonisation von Neuengland' was published at Leipsic in 1847; a defective translation by W. Hazlitt, Jr., appeared in London in 1851. She also wrote numerous tales, and contributed to magazines, both German and English.

Robinson, William Callyhan, American jurist: b. Norwich, Conn., 26 July 1834. He was graduated from Dartmouth College in 1854; studied at the General Theological Seminary in New York, and entered the Episcopal ministry in 1857, but later studied law and was admitted to the bar in 1865. In 1869 he became instructor in the Yale Law School, and later professor of elementary and criminal law, and the law of real property. He was judge of the court of common pleas, New Haven, 1874-6, and member of the Connecticut legislature in 1874. Since 1895 he has been dean of the law school of the Catholic University of America. He has published: 'Notes of Elementary Law' (1876); 'Elementary Law' (1882); 'Law of Patents' (1890); 'Forensic Oratory' (1893); 'Elements of American Jurisprudence' (1900).

Robinson, Ill., city, county-seat of Crawford County, on the Wabash River, and on the Cleveland, C., C. & St. L. and the Illinois C. R.R.'s; 36 miles southwest of Terre Haute, Ind. It was settled in 1842, when it became the county-seat; was incorporated as a village in 1866, and as a city in 1886. It is the trade centre of a fruit and grain growing and sheep raising region, and contains a few small mills. It has two banks, with a combined capital of \$75,000, doing business to the amount of \$800,000 annually. It contains a public high school founded in 1885, with a school library of over 500 volumes (1903), and a Carnegie library. The city government is by a mayor and a council of six; the members of the council are elected for two years, three being chosen each year. Pop. (1890) 1,387; (1900) 1,683.

G. W. HARPER,

Editor of the Robinson 'Argus.'

Robinson Crusoe, a world-famous tale by Daniel Defoe, published in 1719, and supposed to have been suggested by the experience of Alexander Selkirk (q.v.), who was shipwrecked and lived for years on a desert island. Crusoe, an Englishman, goes to sea in his youth, is captured by the corsairs, is shipwrecked and washed ashore on an uninhabited island, formerly supposed to have been in the Pacific, but recently satisfactorily identified with Tabago in the Caribbean Sea. The narrative consists of a careful description of his adventures and experiences during the 28 years of his exile. The first volume ended with the return of Crusoe to England, and met with such remarkable suc-

cess that the author, four months later, brought out a second volume, entitled 'The Farther Adventures of Robinson Crusoe'; and this in turn was followed, one year later, by a third, relating his 'Serious Reflections' during his wanderings. The simplicity of style and the realistic atmosphere pervading the narrative, have caused the popularity of this book to remain unimpaired.

Robison, John, Scottish scientist: b. Baldernock, Stirlingshire, 1739; d. Edinburgh 30 Jan. 1805. He entered Glasgow University in 1750. In 1758, as private tutor to the son of Admiral Knowles, he accompanied the expedition under General Wolfe for the reduction of Canada. In this situation, besides instructing his pupil, he was employed in making surveys of the coasts and harbors on the river Saint Lawrence. In 1763 he resumed his studies at Glasgow, devoting himself to mechanics, to which he was influenced by his acquaintance with James Watts, then employed in perfecting the steam-engine. In 1766 he was appointed to the chair of chemistry in the university. Admiral Knowles having been recommended by the British government to the Empress Catharine of Russia to superintend the improvement of her navy, Robison accompanied him as private secretary in 1770. In 1772 he was appointed by the empress inspector-general of the corps of marine cadets at Cronstadt. In 1773 he accepted the chair of natural philosophy at Edinburgh, which he continued to fill till his death. His writings include 'Elements of Mechanical Philosophy' (1804); 'A System of Mechanical Philosophy' (1822); and many contributions to the third edition of the 'Encyclopædia Britannica.'

Rob'john, William James ("CARYL FLORIO"), American musician and composer: b. Tavistock, Devonshire, 2 Nov. 1843. He came to New York in 1857, and in 1858-60 was first boy soloist at Trinity Church, New York. He afterward went on the stage as a singer, was organist in several churches, and also conducted opera in Havana and in New York. He organized the Palestrina Choir in 1886, and in 1889-91 was musical director of Wells College, Aurora, N. Y. His compositions include cantatas, overtures, symphonies, chamber music, and sacred music, in addition to the operettas: 'Inferno' (1871); 'Les Tours de Mercure' (1872); 'Suzanne' (1876); and the operas: 'Gulda' (1879); and 'Uncle Tom's Cabin' (1882).

Rob'sart, röh'särt, Amy, a character in Scott's novel, 'Kenilworth.' She is the unacknowledged wife of the Earl of Leicester, whom she follows to the castle of Kenilworth during the queen's visit; but there she is disowned, and is returning to her original place of concealment, when she meets the death prepared for her by Richard Varney.

Rob'son, Stuart, American actor: b. Annapolis, Md., 4 March 1836; d. New York 29 April 1903. His father's name was Charles Stuart, and he was christened Henry Robson Stuart. As a boy he acted as page in the House of Representatives during the 30th and 31st Congresses. Adopting the stage as a profession, he appeared first at the Baltimore Museum in 1852. He appeared in a play with William H. Crane in 1877 at the Park Theatre, New York, and their joint success led to a 12 years' partnership, during which time they produced 'Twelfth

Night,' 'The Comedy of Errors,' and 'The Merry Wives of Windsor,' besides other comedies and farces. In 1888 Bronson Howard wrote for them 'The Henrietta,' which was also played by Robson after their partnership ended. Plays in which he appeared as an independent star were 'Is Marriage a Failure?'; 'She Stoops to Conquer'; 'The Meddler' (1898) by Augustus Thomas; 'The Jucklins' (1900) by Opie Read.

Roburite, an explosive patented by Dr. Roth in 1887. It consists of dinitrochlor-benzene mixed with ammonium nitrate, and must be used dry. The detonation of the mixture is to be effected by means of fulminate of mercury. Roburite burns quietly, and is not sensitive to shock. Its most successful use has been in the mining of coal, where it is valuable not only because it causes little dust, but also because it allows of blasting the coal in large blocks.

Robusti, rō-boos'tē, **Jacopo**. See TINTO-RETTO.

Roc, rōk, a mythical bird of enormous size, supposed to have been able to perform wonderful feats of strength and ferocity. The most popular accounts of the roc are given in 'The Arabian Nights' Entertainments,' where the bird plays an important part in the fortunes of Sinbad the Sailor. Sinbad describes the roc as white, with a claw as large as the trunk of a large tree and with a beak of prodigious size and sharpness. Its egg, he declares to be 50 paces in circumference, about 150 feet. Another writer computes that the egg of the roc is equal to 150 hens' eggs. The bird is described as a bird of prey, "able to bear an elephant away in its talons," and "killing the moa, which it bore to its nest and destroyed to provide food for its young." See, in 'The Arabian Nights' Entertainments,' the accounts of the second voyage, and the third Calendar's Story. Attempts have been made to identify the roc with the so-called elephant-birds of Madagascar and New Zealand, but it is asserted by naturalists that neither this huge bird (which is not a bird of prey) nor the *Harpagornis*, the largest known rapacious bird, could have performed the feats commonly attributed to the roc. There was described to the Parisian Academy of Sciences the fossils of an enormous bird called the *Æpyornis* and two of its eggs, fossil remains of which had been discovered. (See reports for first quarter, 1851.) This little-known colossal has been accepted as the nearest approach to the fabulous roc.

Roca, rō'kā **Julio A.**, Argentine statesman: b. Tucuman, Argentina, 1 July 1843. He was trained in the Paraná military school, entered the army, and in 1874 became general. In 1878-80 he was war minister, and as such headed in person the expedition which subdued the Patagonian Indians. From 12 Oct. 1880 to 12 Oct. 1886 he was president of the republic. It was during his administration that the serious Argentine financial crisis occurred.

Rocafuerte, rō-kā-foo-ār'tā, **Vincente**, South American statesman: b. Guayaquil, Ecuador, 3 May 1783; d. Lima, Peru, 16 May 1847. He was educated in France and England, and in 1812 was elected to the Spanish Cortes by Guayaquil, but his opposition to the policies of Ferdinand VII. was resented, and he was obliged to escape to France. He went to Lima, and to

the United States in 1819, and in 1824 to Mexico, where he became secretary to General Michelena. He accompanied him to England, and after the recognition of Mexico's independence and Michelena's return, he remained in England as *chargé d'affaires*. In 1830 he resigned and returned to Mexico, where he edited the 'Fénix de la Libertad.' He went to Guayaquil in 1833, and was soon after elected deputy to congress for the province of Pichincha, but was exiled because of his opposition to the administration. The province of Guayaquil then revolted against General Flores and proclaimed Rocafuerte as supreme chief. He was defeated and captured by Flores, but an amicable arrangement was soon afterward made, co-operation in the reorganization of the republic was agreed upon, and Rocafuerte served as president in 1835-9. His administration was one of ability. He introduced many reforms, and placed the financial affairs of the country on a sound basis. His after life was spent in various diplomatic missions, in which he sustained his high reputation as a statesman. He wrote: 'Ideas necesarias á todo pueblo independiente, que quiere ser libre' (1820); 'Ensayo sobre tolerancia religiosa bajo el aspecto político y como medio colonización y de progreso' (1831); etc.

Rocaille, rō-kal-ē'. See Rococo.

Roc'amboule, a species of onion (*Allium scorodoprasum*) having bulbs resembling those of the garlic; but the cloves are smaller. It is cultivated for the same purposes, and is considered as having a more delicate flavor.

Rocha Pitta, Sebastiao, sā-bās-tē-ā'ñoō rōsh'ā pēt'tā, Brazilian author: b. Bahia, Brazil, 3 May 1660; d. near there 3 Nov. 1738. He was a leisurely student, and the author of some commonplace verse and fiction. He made very elaborate preparations for his 'Historia da America Portuguesa desde o seu Descobrimento até o Anno 1724' (1730), which won for him deserved success and numerous honors. The book was the first history of Brazil in any true sense, and the material it contained has proved of much value to subsequent workers in that field.

Rochambeau, rō-shān-bō, **Jean Baptiste Donatien de Vimeure**, COMTE DE, French marshal: b. Vendôme 1 July 1725; d. Thoré 10 May 1807. He was the son of the governor of his native town and was brought up for the church, but at 17 entered the army. He fought with distinction in the war of the Austrian Succession, attained the rank of colonel and in 1749 followed his father as governor of Vendôme. During the Seven Years' war he did excellent service in Minorca (1756) and later in Germany, winning the rank of brigadier-general. He was made lieutenant-general in 1780 and in the same year was despatched at the head of an army of 6,000 men to co-operate with the American forces in the War of Independence. In July he landed in Rhode Island and, intrenching himself at Newport, held his position till June of the following year, when, in pursuance of a plan of campaign arranged between Rochambeau and Washington, the French troops, reinforced by some 3,000 men, marched across Connecticut and joined the American army on the Hudson, whence was begun the southward march for Yorktown. The city was invested on 29 September and after two

brilliant assaults by the French troops and the defeat of the English fleet by the French under De Grasse in Chesapeake Bay, Cornwallis surrendered. Rochambeau's services to the American cause were enhanced by the utter absence of jealousy or self-assertion on his part; he placed himself implicitly under Washington's orders and within his own army maintained the sternest discipline. Congress voted its thanks to the French commander for his valuable services and presented him with two guns taken at Yorktown. Returning to France in 1783, he took part in the earlier events of the French Revolution and after being raised to the rank of field-marshal, was given in 1791, command of the Army of the North. Regarding with disfavor the progress of the Revolutionary policy, he resigned in June 1792 and soon after was imprisoned at Paris, regaining his liberty at the end of the Reign of Terror in 1794. In 1804 Napoleon made him an officer of the Legion of Honor. A statue of Rochambeau was erected at Vendôme in 1869, and a replica of it in Lafayette Square, Washington, was unveiled with much ceremony in 1902. He left behind him, 'Memoires du Maréchal de Rochambeau' (1890), translated, in part, into English (1838).

Rochdale, roch'dāl, a market-town and parliamentary borough of England, in Lancashire, 10 miles north-northeast of Manchester. The parish church of St. Chad, finely situated on a lofty height, and approached from the lower part of the town by a flight of 122 steps, is a spacious and venerable structure of the 12th century (restored in 1837), partly in the late Norman and partly in the Perpendicular style, with a square embattled tower, several windows of rich tracery, and some very ancient monuments. Rochdale is a place of considerable antiquity, and had a Roman station in its vicinity. Its woolen manufacture appears to have been introduced by the Flemings in the reign of Edward III., and having continued to flourish, is mentioned as famous in the reign of Elizabeth. The Rochdale Co-operative Store, which has about 12 branches in the town, was the first society of its kind, and has served as a model for other co-operative societies. Pop. (1901) 83,112.

Rochdale Pioneers, or Rochdale Society of Equitable Pioneers. See CO-OPERATION.

Roche, rôch, Alexander, Scottish artist: b. Glasgow 17 Aug. 1863. He began life as an architect, but turning his attention to painting, studied at Paris, and is now corresponding member of the Munich Secession. He has painted in landscapes and genre, and among his pictures are: 'Tête-a-Tête,' which carried off a gold medal at Munich in 1889; 'Fishers' (1891), bought by the Berlin Gallery; 'Landscape,' awarded a gold medal at Dresden (1897); 'Prue' (1902), bought by the Munich Gallery. He also executed the frescoes in the Banqueting Hall, Glasgow Municipal Building, 1900. He has published 'Finish in Art' (Transactions of the National Association for the Advancement of Art, 1889).

Roche, James Jeffrey, American author and editor: b. Mountmellick, Queen's County, Ireland, 31 May 1847. He was taken to Prince Edward's Island in infancy, was educated at Saint Dunstan's College, Charlottetown, and in 1866-83 was engaged in commercial pursuits in

Boston. In 1883-90 he was assistant editor of the Boston 'Pilot,' of which he has been editor-in-chief since 1890. He has published: 'Songs and Satires' (1886); 'The Story of the Filibusters' (1891); 'Her Majesty, the King' (1898); 'By-ways of War'; etc.

Roche, Regina Maria (Dalton), Irish novelist: b. south of Ireland about 1764; d. Waterford 17 May 1845. She attained sudden fame in 1798 by the publication of her four-volume story, 'Children of the Abbey,' much in the fashion of the 'Mysteries of Udolpho,' which it rivaled in popularity. She then set to work on a long series of similar books—'The Nocturnal Visit' (1800); 'The Tradition of the Castle' (1824); 'The Nun's Picture' (1834), and a dozen others.

Roche, rôsh, Troilus de Mesgouat, MARQUIS DE, French colonizer in America: b. France 16th century; d. Brittany after 1600. In 1598 he received from Henry IV. letters-patent creating him lieutenant-general of Canada and adjacent islands, with power to establish colonies anywhere in North America. With a crew drawn largely from French prisoners, he set sail with one Chedotel of Normandy as pilot. After landing 40 of his force on Sable Island, he explored Acadia. Head winds prevented a landing at the island, on his return; and sailed on for France, where he was impressed for a year. Chedotel was ordered to go in search of the 40 followers, who had fortunately made their escape by means of wrecked vessels found on the coast.

Rochefort, Henri, ôñ-rê rôsh-fôr (VICTOR HENRI, MARQUIS DE ROCHEFORT-LUÇAY), French journalist and politician: b. Paris 31 Jan. 1831. He became known as the author of successful vaudevilles and farces and as a contributor to *Charivari*, *Figaro*, and other Parisian periodicals, wherein his political reviews were marked by a brilliancy of wit and audacity of attack that brought upon him the resentment of the government. His assaults on Napoleon III. led the emperor to demand his expulsion from the staff of *Figaro*. Rochefort thereupon (1868) founded a weekly of his own, 'La Lanterne,' in which he continued his assaults on the government with unrivaled weapons of sarcasm and ridicule, beneath which the emperor and his ministers were helpless. The 'Lanterne' attained an enormous circulation, and when the editor was forced by repeated sentences of the courts to take refuge in Belgium, he continued its publication in a spirit all the more acrimonious. In 1869 he was elected to the Corps Législatif, and established the 'Marseillaise' with the professed object of combating the Second Empire. In January 1870 he was imprisoned for inciting to insurrection. After the fall of the Empire he became a member of the government of national defense, but was out of sympathy with the conservative tendencies of that body and strongly inclined to the radical element that afterward brought forth the commune. In May 1871 Rochefort fled from Paris, but was captured and sentenced by a court-martial to deportation. In 1873 he was transported to New Caledonia, but escaped in the following year, lived in Belgium and Switzerland, and renewed the publication of the 'Lanterne.' In 1880 he returned to Paris and founded the 'Intransigeant,' a periodical of virulent protest. He was deputy in 1885-6, be-

came an ardent supporter of Boulanger, and in 1889 was sentenced to imprisonment, but escaped to England. He returned under amnesty in 1895, and attracted public attention as one of the most violent opponents of Captain Dreyfus (q.v.) in that celebrated affair. He published 'Les Aventures de ma Vie' (1896).

Rochefort, or **Rochefort-sur-Mer**, France, chief city of an arrondissement of the department of Charente Inférieure. It is notable for its naval and army institutions, and its well-built public works. It has two harbors—military and commercial. Napoleon purposed embarking for America from this point, but his plans were frustrated. The manufactures include tiles, beer, candles, artificial flowers, naval clothing. There are also various metal foundries, etc. Pop. (1901) 35,528.

Rochefoucauld, rōsh-foo-kō, **François**, DUC DE LA. See LA ROCHEFOUCAULD.

Rochegrosse, **Georges**, zhōrzh rōsh-grōs, French painter; b. Versailles 1859. He studied at Paris, and developed under Lefebvre and Boulanger a powerful naturalistic style with an almost startling brilliancy of technique. His tendency to the brutal side of tragedy in his choice of subjects is, however, frequently revolting, and his pictures too frequently swim in blood. Among the best known and most characteristic are: 'The Death of Geta, Emperor of Rome,' and 'The Fall of Babylon.'

Rochejacquelein, rōsh-zhāk-lăn, **Henri de la**. See LA ROCHEJACQUELEIN.

Rochelle, rō-shêl', Ill., city in Ogle County; on branches of the Chicago, Burlington & Quincy railroad; about 70 miles west of Chicago, and 150 miles north of Springfield. It is the commercial and trade centre of a fertile agricultural region, in which stock-raising is an important industry. The manufacturing interests are connected with farm products. It has a high school, public elementary schools, and a public library. Pop. (1890) 1,789; (1900) 2,073.

Rochelle, La, la rō-shêl, France, chief town of the Charente-Inférieure, a fine port and strongly fortified. It carries on a trade, the value of whose imports amounted in 1899 to almost \$13,000,000; its exports to more than \$5,000,000. Rochelle played an important role in the Reformation period, resisting many assaults, but was finally forced by famine to succumb (1628). Pop. (1901) 31,318.

Rochelle Salt, sodium potassium tartrate, a white crystalline substance, discovered by Seignette, an apothecary of Rochelle, France. It has a mildly saline and slightly bitter taste, and is much used as a laxative, especially in sedlitz powders.

Roches Moutonnées, rōsh moo-tō-nă', bosses of rock smoothed and rounded by glacial action. Such protuberances occur as scattered knobs and undulating surfaces in former glacial areas. Those little acted on by the weather generally show the characteristic glacial scratches and groovings. Some are smoothed and polished all over, and have the appearance of whales' or dolphins' backs; others are smoothed only on the side which faces the direction from which the glaciating agent flowed; the other side, protected from abrasion, being left in its rough unpolished condition. The name is fancifully

applied because such rocks in a valley bottom, when seen from above, have a seeming resemblance to the rounded backs of sheep lying down.

Rochester, rōch'ēs-tēr, **John Wilmot**, 2D EARL OF, English poet and courtier; b. Ditchley, Oxfordshire, 10 April 1647; d. Woodstock Park, Oxfordshire, 26 July 1680. On his father's death in 1658 he succeeded to his titles and estates, the latter of which he soon dissipated. Having studied at Oxford, he served with credit in the fleet under Lord Sandwich at the attack on Dutch ships in the harbor of Bergen, but subsequently gave himself up to dissipation, and became the personal friend and favorite of Charles II., who is said to have encouraged and shared many of his exploits. He frequently fell into disgrace at court, though his pardon was not long in forthcoming. His constitution at length gave way, and at 30 he was visited with all the debility of old age. He lingered for some time in this condition, and died, after sending for Bishop Burnet and professing great penitence for his misspent life. The volume of obscure verse purporting to be his contains much that is spurious. He was no better and rather worse than the lax writers of his day; but the edition of his poems brought out by his friends in 1691 contains such exquisite lyrics as entitle him to rank as the best song writer between Carew and Burns. He wrote the famous epigram on Charles II., asserting he "never said a foolish thing and never did a wise one."

Rochester, **Nathaniel**, American pioneer; b. Cope Parish, Westmoreland County, Va., 21 Feb. 1752; d. Rochester, N. Y., 17 May 1831. Having gone in 1763 to Granville County, N. C., he was made a member of the committee of safety for Orange County in 1775, in 1776 was a member of the first provincial convention in North Carolina, and was appointed by the convention a deputy commissary-general of military and other stores. He soon afterward resigned and was elected to the North Carolina legislature. In 1783 he established various manufacturing enterprises at Hagerstown, Md., and in Maryland became a member of the assembly, judge of the county court, and a presidential elector. Independently and in association with others, he purchased tracts of land in western New York, including (1802) one of 100 acres in Falls Town. He removed (1810) to Livingston County, near Dansville, and (1815) to Bloomfield, Ontario County. In April 1818 he went to Falls Town, which had been named Rochester in his honor; and in 1821-2 was the first representative of Monroe County in the State legislature. Consult Rochester, 'Early History of the Rochester Family in America' (1882).

Rochester, England, in the county of Kent, a river port on the Medway, 29 miles southeast of London. Its ancient castle (11th century) on an eminence overlooking the river, commands the view of a vast expanse of the surrounding country. The great tower of this ruined castle is one of the finest specimens of Norman architecture extant. The cathedral founded by Saint Augustine in 604 presents a mixed style, as it was destroyed by the Danes, and parts were added and remodeled subsequently at various epochs. There are many monuments of great antiquity. Of secular buildings, the town hall, exchange, municipal buildings

ROCHESTER

and almshouses, schools, and Working Men's Institute are the most important. There is a large shipping trade, a steam-engine manufactory, and other industrial establishments, and lucrative oyster fishing. The town was founded by Ethelbert. The castle was built by Henry III. Henry VIII. visited Rochester, accompanied by Charles V., and Elizabeth spent five days there in 1573. Dickens introduces Rochester into 'Pickwick,' 'Edwin Drood,' and others of his novels. Pop. (1901) 30,622.

Rochester, Minn., city, county-seat of Olmsted County; on the Zumbro River, and on the Chicago & N. and the Chicago and G. W. R.R.'s; about 92 miles southeast of Saint Paul and 45 miles west of Winona. It was settled in 1854 by James Bucklin and Mr. Proudfoot, and incorporated as a city in 1858. The city was visited by a cyclone in 1883, which caused the death of 27 persons and the loss of a large amount of property. It is in a productive agricultural region, in which wheat is one of the principal crops. Considerable attention is given to stock-raising. The chief manufacturing establishments are flour and grist mills, a foundry, and machine shops. There are large grain elevators and stock yards. The principal buildings are the court-house, municipal building, Masonic Temple, Odd Fellows' building, opera house, Saint Mary's Hospital, a number of churches, and the convent of the Sisters of Saint Francis. The educational institutions are the high school, public and parish elementary schools, private commercial schools, Notre Dame de Lourdes Academy (R. C.), founded in 1877, and four libraries. The three banks have a combined capital of \$200,000; and the annual business amounts to \$1,500,000. The government is vested in a mayor, alderman-at-large, and a council of six members, three of whom are chosen by popular vote each year. Pop. (1890) 5,321; (1900) 6,843.

A. W. BLAKELY,

Editor (*Post and Record*.)

Rochester, N. H., city in Strafford County; on the Cocheco and Salmon Falls rivers, and on four railroads, all operated by the Boston & Maine railroad; about 30 miles east by north of Concord, and 35 miles northeast of Manchester. It was settled in 1722 by emigrants from England; incorporated as a town in 1722 and chartered as a city in 1891. It is the commercial and industrial centre of a large part of Strafford County; the chief manufacturing establishments are shoe factories, which have 1,000 employees; woolen mills, 400 employees; brick works, box factories, and other manufactories having fully 500 employees. The trade is chiefly in its own manufactures and in farm products. The principal public buildings are the Gaffney Home for the Aged, the 13 church buildings, and the schools. The educational institutions are a high school, public and parish schools, private commercial schools, and a public library. The three banks have a combined capital of \$150,000. The government is vested in a mayor and a council of 18 members. The members of the council hold office three years, six being elected each year. Pop. (1890) 7,396; (1900) 8,466.

WILLIS M. DUFFEE,

Editor (*Rochester Courier*.)

Rochester, N. Y., city and county-seat of Monroe County, on the Genesee River and

the Erie Canal, and on the New York Central and Hudson River, the West Shore, the Lehigh Valley, and the Erie, and other railways; 229 miles west of Albany. Almost in the centre of the city are the Upper Falls of the Genesee. The city lies on a plateau, 263 feet above Lake Ontario, and is built on both sides of the river.

The Genesee River.—Midway through Rochester runs the Genesee, which is spanned by 10 bridges within the city limits, the middle one of which, built of stone, is enclosed by stores on both sides, but the others, of iron construction on stone piers, are open, affording beautiful and diversified views of the river, particularly from the northernmost bridge, whence can be seen a winding gorge nearly 200 feet deep. The sides of this display several distinct geological strata, showing the gradual formation of the earth, the red Medina sandstone being plainly visible as it rises from the water's edge for more than half the height of the precipice, when it gives place to successive layers of green shale, limestone, hematite iron ore, green and purple shale, and finally a topmost crust of limestone, all belonging to the Upper Silurian Age. At the point referred to are the lower falls, about 80 feet high, a curtain of water more beautiful, though less imposing, than the principal cataract, two miles farther back, in the centre of the city, from which, with its sheer descent of 96 feet, Sam Patch jumped to his death in 1829.

The Erie Canal.—Crossing the city from west to east is the Erie Canal, completed in 1825, which spans the river by means of an aqueduct of pleasing proportions, built of Lockport limestone at a cost of \$600,000. This canal, the surface of which at this point is 506 feet above tide-water, was, for many years after its construction, the great highway of commerce through the State, carrying to the eastern seaboard the cereal products not only of this region but of the growing West and enriching Rochester as well as other places on its banks. Wholly as a means of travel and largely as a medium of traffic its function was long ago appropriated by railroads, of which 11 enter the city.

Parks.—The Rochester Park Commission was created in 1888, since when work has been done so judiciously by the aid of the best landscape architects and nurserymen, taking advantage of the rolling lands that were obtainable, that few cities present so attractive an appearance in this regard; there are now three principal parks—the Genesee Valley, Seneca, and Highland—besides 11 smaller locations, making in all 666 acres of park territory.

Public Buildings.—There are four well-equipped hospitals—the City, Saint Mary's, the Homeopathic, and the Hahnemann—besides a municipal hospital for contagious diseases and the insane asylum, or State Hospital. There are numerous hotels—of which the largest are the Powers, the Whitcomb, the Bristol, and the Osburn—and many apartment houses, which are greatly in demand. Of legitimate theatres there are four, the Lyceum and the Cook on the east side of the river, the National and the Baker on the west. Six daily newspapers are published here—the *Democrat and Chronicle*, the *Herald*, the *Union and Adver-*

1. The Falls of the Genesee, Upper Falls.

2. The Falls of the Genesee, Lower Falls.

ROCHESTER

tiser, the *Post Express*, the *Times*, and the *Abend Post*—besides a large number appearing less frequently. Of the social clubs the principal are the Genesee Valley, the Rochester, the Eureka, the Rochester Whist, and the Columbia Rifle; of literary clubs the leading ones are the Pundit, the Fortnightly, and the Wednesday Morning.

Manufactures.—Rochester was built up by the milling industry; the quality and amount of wheat grown in the valley during the early days made a demand for flouring-mills, which was strengthened by the presence of the high falls, so that those structures sprang up rapidly on both banks of the river and became so numerous that the place was long known as "the flour city" and its preeminence in this respect was recognized throughout the country. The development of the enormous wheat-fields of the West caused a decline in this business, so that its relative position was taken by the nursery industry; this was started here in 1838, after which it increased so that in 1904 there were more than 30 firms engaged in the business; besides the nurseries there are several large seed-houses, Rochester being the foremost city in the world in this regard; the first trees sent to California went from here in 1849. Rochester is the home of the camera, and practically all of the film cameras that are made in the world are manufactured here, as well as the great majority of plate cameras; in other photographic apparatus, in optical instruments, and in fruit canning it also leads all other places on the globe. Although Rochester is only the 24th city in the United States in point of population, it is the first in many things; it ranks third as to clothing, with an annual output of \$10,000,000, and fourth as to boots and shoes, with a production of \$7,000,000; its total manufacture exceeds \$70,000,000 annually, with over \$50,000,000 invested in that and the wholesale trades. The receipts at the post-office for 1903 were \$619,785.95; 640,000 tons of bituminous coal and over 360,000 tons of anthracite are consumed and shipped from here annually.

Banking and Commerce.—In the promotion of trade and in the inducement of outside manufacturers to locate in Rochester an important factor is the Chamber of Commerce, organized in June 1888, which now has a membership of 389. For providing the money necessary to carry on the business above indicated there are eight banks and five trust companies, with a combined capital of \$3,025,000, besides four savings banks, the total resources of all these institutions being \$103,124,410.73; the amount passing through the clearing-house in 1903 was \$133,773,705.89. For 1904 the assessed valuation of real estate will be above \$109,000,000, the tax levy is \$2,129,646.48, the total city debt 1 January being \$10,370,328.54.

Education.—The Rochester Athenæum and Mechanics' Institute—generally known by the latter part of its title—was founded in 1885 as a free drawing-school and has so expanded that it now gives instruction in practical arts and sciences to about 4,000 pupils and ranks fourth among the technical trade schools of the country. The University of Rochester, founded in 1850 and located in beautiful grounds in the eastern part of the city, has a faculty of 23 instructors, with 264 students, and a library

of 41,000 volumes. There are also the Rochester Theological Seminary, of the Baptist denomination, founded in the same year, with a present faculty of 11, over 100 students, and 32,000 books; Saint Bernard's (Roman Catholic) Theological Seminary, occupying capacious grounds north of the city, started in 1893, having now 13 professors, 145 students, and 15,000 volumes, and the Wagner Memorial Lutheran College, chartered in 1885, having at present five professors and about 50 students. The public school system, under the control of a board of education of five members, is among the best in the country; it maintains 34 buildings, with as many principals; during 1903 there were 606 teachers, with 26,325 registered pupils; the East Side high school was lately completed at a total cost of \$322,000; the expenditures of the board in 1903 were \$765,117.54. There are also 18 parochial schools and many private ones, including three academies—two of them for girls, one for boys—and one large institution for the instruction of deaf-mutes. The only free public library is the Reynolds, with 52,000 volumes, mainly books for reference and consultation.

Churches and Charities.—There are over 100 churches in Rochester. The first congregation (Presbyterian) was formed in 1815; the Roman Catholic diocese of Rochester was created in 1868. Of the seven cemeteries the oldest is Mount Hope, opened in 1838, remarkable for its natural beauty, owing to the undulations of the ground in every direction. There are five orphan asylums, three of which are under Catholic control, one under Jewish. In 1822 the Female Charitable Society was organized, from which have risen the kindred institutions of to-day, including, besides the hospitals and asylums, the Industrial School—not to be confounded with the State Industrial School, a large establishment for the reformation of young criminals—the Home for the Friendless, the Humane Society, the Children's Aid Society, the Society for the Organization of Charity, and a host of other associations for relieving distress, the most of which are connected, more or less directly, with the various churches.

Public Service.—In 1873 the Holly system of waterworks was introduced for fire protection. In the same year pipes were laid to Hemlock Lake, 28 miles away, by which water is obtained for drinking and other purposes that is unsurpassed, possibly unequaled, in its purity by any other city in the United States; 22,000,000 gallons are delivered daily; there are within the city limits 290 miles of distributing mains, with 300 miles of subsidiary pipe, and 3,050 hydrants; the total cost of the works was over \$7,500,000. The street cleaning is done by water-carts, instead of by the unsanitary means of dust-raising brooms. It is probably owing, partly, to the agencies just described that Rochester is one of the most healthful cities of the Union, the annual death rate during five years averaging 13 to the 1,000. The police force consists of 193 uniformed men; the fire department has 201 men, with 12 steamers and hose-carts, five truck companies, two chemical engines, one water tower, three separate hose companies, and one protective. The meteorological records of the past 33 years show that the mean annual temperature was 47.3, the mean maximum 55.4

the mean minimum 39.2, the absolute maximum 99, the absolute minimum 14 below zero, the mean annual precipitation 34.5 inches, the average number of clear days annually 83, partly cloudy 126, cloudy 156.

Rochester has always been free from overwhelming calamities. The worst two disasters, financially, in its history, in neither of which was a single life lost, were the great flood of 17 March 1865, when much of the city was under water for two days, doing a million dollars' worth of damage, and the fire of 26 Feb. 1904, which devastated a large portion of the dry goods district and inflicted a loss of \$3,000,000. Rochester has a well-equipped electric street car system, with 103 miles of track, besides the lines that run to surrounding villages in every direction. There are two telephone systems in the city, one owned by a foreign corporation, the other a home enterprise, which, though new, is very successful.

History.—In 1789 a saw-mill and a grist-mill were built on the west bank of the river by Ebenezer Allan—commonly called "Indian Allan," from his life-long association with the savages—who received, as compensation for the work, from Phelps and Gorham, the owners of the land, 100 acres surrounding those pioneer structures. Though no settlement was made at the time, that tract became the nucleus of the future city. In 1803 it was bought by Col. Nathaniel Rochester, Col. William Fitzhugh, and Maj. Charles Carroll, all of Maryland, for \$17.50 an acre. Some scattered dwellings were built in the vicinity within the next few years, but no house was erected in what was then called Rochester, after the first-named proprietor, till 1812, when a log cabin was built on the spot that has ever since been known as the Four Corners. Other residences soon went up, in one of which the first white child was born, 2 Dec. 1814. Settlers from the New England States came pouring in and when the first census was taken in December 1815, the population was shown to be 331.

In 1817 it was incorporated as a village, under the name of Rochester ville, but in 1822 the title was changed to Rochester. In 1823 the size of the village was augmented by taking in a part of the town of Brighton, on the east side of the river, and subsequent additions have so increased the area that it now embraces 11,365 acres, with 325 miles of open streets, 126 miles of which are improved, with 230 miles of sewers. It was incorporated as a city in 1834, the first mayor being Jonathan Child. Rochester was the birthplace of modern Spiritualism, the famous Fox sisters having given here, in 1849, the first manifestations of mysterious rappings, which speedily became known as the "Rochester Knockings."

During slavery times Rochester was one of the centres of the Abolition movement and one of the principal stations of the "underground railroad." It was the home of Frederick Douglass, the celebrated negro orator, and was the place in which William H. Seward (q.v.), in 1858, uttered, in a public address, his memorable phrase in speaking of the struggle between freedom and slavery as an "irrepressible conflict between opposing and enduring forces."

Population.—In 1900, Rochester ranked 24 in the list of cities in the United States. The

population in 1820 was 1,502; (1825) 5,273; (1834) 12,252; (1880) 89,363; (1890) 133,896; (1900) 162,608; (1904) 180,000. This shows an increase between 1880 and 1890 of 50 per cent, and between 1890 and 1900 of 21 per cent.

Bibliography.—Bragdon, 'Notable Men of Rochester and Vicinity' (1902); Ward, 'Churches of Rochester' (1871); Peck, 'Landmarks of Monroe County' (1895); Parsons, 'History of Rochester Presbytery' (1889); Mathews, 'Fire Service of Rochester' (1888); Parker, 'Rochester, a Story Historical' (1884); Peck, 'History of Rochester' (1884); O'Reilly, 'Sketches of Rochester' (1838); Peck, 'History of the Police Department of Rochester' (1903); *Union and Advertiser* Year Book (1888-1903); Annual Reports of the Rochester Chamber of Commerce (1888-1903).

WILLIAM F. PECK,

Author of 'The History of Rochester.'

Rochester, Pa., borough in Beaver County; at the junction of the Ohio and Beaver rivers, and on the branches of the Pennsylvania railroad; about 25 miles northwest of Pittsburgh. It is connected by electric lines with Beaver, Beaver Falls, New Brighton, and other nearby places. A bridge across Beaver River connects the borough with Bridgewater. Also one across the Ohio connects the town with Monaca. It is in the coal and oil region, and in the vicinity are deposits of fire-clay and building-stone quarries. The chief manufactures are flour, lumber, brick, glass ware, foundry products, mining tools, structural iron, and oil well supplies. The principal public buildings are the churches, schools, and Masonic Temple. Pop. (1900) 4,688.

Rochester Theological Seminary, founded at Rochester in 1850 by the New York Baptist Union for Ministerial Education. As early as 1847 an attempt was made to remove Madison (now Colgate) University from Hamilton to Rochester, but this was opposed by the Baptists of Hamilton and legal obstacles were found, so that the plan was abandoned. The University of Rochester (q.v.) was established at the same time by the Baptists, and for a time the two institutions occupied the same buildings, but there has never been any organic connection between the university and the seminary, the latter being essentially a professional school. The regular course is three years; instruction is given in the departments of Hebrew language and literature (Old Testament), theology, church history, New Testament, homiletics and pastoral theology, elocution, English Bible, and Christian ethics. Graduation from college or preparation in Greek sufficient for the study of the Greek Testament is required for admission; formerly there was an English course for those who had no classical training; this was abandoned in 1889-90. In 1852 a German department was organized; the course is literary as well as theological, and covers six years. The seminary was at first without endowment, and at the end of 10 years had only \$75,000; in 1903 the productive funds amounted to \$953,768. The library is one of value, including the whole collection of Neander, the German church historian, and numbering 32,500 volumes. The total number of students including the German department was 115 in 1903-4.

Rochester, University of. See UNIVERSITY OF ROCHESTER.

Roch'et, the name given a lawn or lace garment, somewhat like the surplice in shape, but with close-fitting sleeves, worn by bishops, abbots, prelates, and other ecclesiastical dignitaries.

Rochette, Désiré Raoul, dā-zē-rā rā-ool rō-shēt, French archaeologist: b. Saint-Armand, France, 9 March 1790; d. Paris, France, 3 July 1854. He was educated at Bourges, removed to Paris in 1811, in 1815 became assistant professor to Guizot, whom he afterward succeeded in the chair of history at the Sorbonne. In 1826 he became professor of archaeology at Paris, and in 1838 was elected permanent secretary of the Academy of Fine Arts. He gained a wide reputation for learning, was popular as a lecturer, and enjoyed high favor after the Restoration. Besides his unfinished history of ancient art he wrote 'Antiquités du Bosphore Cimmerien' (1822); 'Tableau des Catacombs du Rome' (1837); 'Lettres archéologiques sur la Peinture des Grecs' (1840); 'Mémoire sur l'Acropole d'Athènes' (1845); 'Mémoires d'Archéologie comparée, Asiatique, Grecque, et Etrusque' (incomplete, 1848); etc.

Rock Drills. The steam or rock drill is known to-day as an American invention and its inception dates back to the excavation of the Hoosac Tunnel in Massachusetts. This enterprise was fathered during its period of construction by the State of Massachusetts and was beset with enormous difficulties. To commence the excavation of a tunnel five miles long through hard rock, and to do the drilling by hand, was an audacious proposition. Still this was undertaken by the State of Massachusetts. In those days of inexperience, many methods of excavation were proposed and tried. Machines were built, tested and condemned. Among the inventors, the man who schemed the machine which in general features embodied the requirements of a perforator for making holes for blasting, was Mr. Fowle, of Boston. He constructed the first machine in which the drill used was made the extension of the piston rod of a reciprocating steam engine, which was moved forward toward the rock as the drilling advanced. The drill had a slow rotary as well as a reciprocating motion to insure the boring of a round hole. With this beginning, machines were improved in details, but operated without notable economy. The drills were heavy and could be used practically only when mounted on heavy carriages running on wheels on a track. They were much too heavy for mine or quarry work, although a few were used for such purposes.

Later came a demand for a lighter machine, and the Little Giant and Eclipse machines, both built by the Ingersoll-Rand Company, of New York, were found useful. The Little Giant was operated by a positive motion valve, and the Eclipse by a piston valve. With the introduction of light drills came various improvements which were found to be invaluable as the scope for the use of the rock drill enlarged. In fact, almost a new drill was made when the

machines were applied on a large scale in New York city for outside excavation at a tunnel under 42d street and under Hell Gate, and also in the hard ore mines of Lake Superior.

As soon as the rock drill attained a reasonable state of perfection, its improvement was immediately manifested to the world at large. It has often been called the advance agent of civilization, and it undoubtedly has a better claim to that title than any other mechanical invention of recent date. All modern engineering is dependent on its use, and problems which would be impracticable without this machine are rendered easy. Its influence on mining, quarrying, railroading and navigation has been felt all over the world. The rock drill has developed the mines of South Africa; and such modern engineering feats as the Hoosac and Mount Saint Gothard Tunnels, Hell Gate, Niagara Tunnel, the tunnel under Bergen Hill and the Palisades, the Croton aqueduct and the Chicago drainage canal were carried to success by rock drills. The work done by the rock drill may be said to be from 60 to 150 lineal feet of hole drilled per day of 10 hours in ordinary stone, including shifting and setting up of the drill, cleaning holes, etc. In tests and special cases the figures have been largely exceeded, sometimes as much as 400 lineal feet being made. Records of 24 inches per minute are not uncommon, all, of course, for down holes in favorable rock, but 70 feet per day of 10 hours in granite, including moving and setting up, averages a fair working basis. The cost of drilling in this way may be stated to vary from 2½ to 13 cents per lineal foot, according to local conditions. From four to five cents per foot of hole drilled may be taken as the working figure for general calculations, and this includes all expenses. Compared with hand methods, the cost of which runs from 25 to 70 cents per foot, with an average of 40 to 65 cents per foot of hole in hard rock, this shows that a given amount of drilling may be accomplished by the rock drill for from 1/8 to 1/12 the cost of doing it by hand. There are two distinct methods of machine drilling, one the auger drill, which bores the rock, and the other the percussion drill, such as the Little Giant or Eclipse, working by direct impact, that is, by striking repeatedly in the same spot and by simply bruising or chipping away the rock. Experience has proved that a reciprocating drill operates with the greatest economy and efficiency. The following are improvements made in the rock drill as used to-day.

Commencing with the cylinder of the drill, the method of using long bolts to hold the top and bottom heads in place with an elastic or spring buffer, whereby the blow (struck accidentally upon either head by the piston) is absorbed, may be placed first. The method of gripping the steel and the chuck by means of the "U" bolt and chuck key stands second. The device of flanged and rotating bar dropped through the ratchet box marked a great advance in the art. The use of the taper throttle was also a very neat device for preventing leakage and providing a graduated admission of the working fluid. In passing from the cylinder to its mounting the most important achievement was in the very simple device of mounting the drill on the horizontal arm attached to a vertical column, which in turn was

ROCK EXCAVATING MACHINERY

mounted to a block and jacked in place by two screws, one on either end of the block. A kindred invention was the universal joint applied to the legs of a tripod.

The requirements of a perfect rock drill are numerous, but it should first of all be simple in construction and strong in every part. The parts as far as possible should be so arranged that any broken or worn portion may be easily removed and a new part substituted, causing the least possible delay in the work. The drill should occupy but little space and should be light enough for easily handling. The mountings on which it is set for different kinds of work should be easily put up and easily removed, insuring a great range of adjustability. It must, of course, be economical in its use of the driving fluid and must put down a hole in the shortest possible time.

Surface and Underground Work.—Surface work includes that class of excavation which occurs in open air, and underground operations include such borings as are underground. Surface drilling may be applied for opening up canals, for quarrying purposes, for opening up ways for railroads and similar undertakings. Such work may necessitate the use of tripod, column and shaft bar, quarrying machines, channelers, gadders and the like. Underground work necessitates the use of rock drills and compressed air machinery for purposes of sinking shafts, opening mines, etc. In shaft sinking and tunnel work, as in driving headings and enlarging, it has been found that the column is the best means of mounting rock drills. These columns are simply round, extra heavy, wrought steel tubes with a suitable claw-foot or rosette on one end and either one or two clamping or jack screws on the other. Stopping bars and tripods are also extensively used for special features.

Submarine Work.—Submarine or subaqueous rock excavation is essential for converting shallow rivers and harbors into navigable waterways. The conditions under which submarine rock excavation must be done are difficult to the last degree, calling for special apparatus of unusual strength and endurance. This character of work is nearly always carried on where tides, currents, winds and storms are present in a varying degree, and these elements are practical obstacles to rapid and economical work. But add to these troubles deep water, irregular bottom covered over with mud, sand and other shifting material, which fills in almost as fast as removed, and the undertaking is seen to be extremely difficult. In the early days, the usual method was to lower explosives to the surface of the rock and attempt fracturing by surface blasting. Later a form of drop bore was introduced by means of which holes were drilled and charges inserted as is at present done. Still another form consisted of a very heavy cast iron bar tipped with a sharp steel point, which was raised and allowed to drop. In operation the sharp point strikes the rock and is supposed to break off a certain amount with each blow. This system is used to some extent abroad, even to-day, but in America it has been abandoned entirely for the more progressive method of drilling a hole and inserting the charge of explosive the same as is done in rock excavation on land.

The removal of submarine rock is daily

becoming a more important feature owing to the increasing depth of ocean and lake-going vessels demanding deeper channels for harbors and rivers. A barge, scow or float fitted with a suitable frame to support the drill guides, drill, boilers and other auxiliary apparatus, is usually employed in submarine excavation. The barge is towed into place and anchored by means of cables, anchor chains or spuds, or a combination of these methods, depending upon the rise and fall of the tide, or the currents to be encountered. The form of framework depends largely upon the system used to feed the drills down, as the hole is cut into the rock. The height of the frame and the length of feed depend on the rise of tide and the depth of water over the rock and the depth to which the hole is to be drilled.

Various styles of mountings are employed in submarine excavation work. The drills used for such operations are generally of the heaviest type, as the work to be done is always severe and difficult. EDWARD F. SCHAEFER, M.E.,
Ingersoll-Rand Company, New York.

Rock Excavating Machinery. In quarrying the most important machines are the channeler, the gadder, rock drill, air compressor, etc. To meet the varying requirements of different classes of work four styles of track channelers are manufactured.

Upright Channeler.—This consists of a truck mounted on four flanged wheels running on a track. Upon this truck is carried a boiler, (in the steam driven machine) or a reheater (in the air driven channeler) together with a powerful chopping engine mounted at one side on a frame of great strength. At the end of the piston rod of this engine are connected cutting steels which are driven against the rock by steam or air power in the engine cylinder.

Swing Back Track Channelers.—In machines of this type, the frame carrying the cutting engine swings on a hinge joint, giving an angular adjustment up to 45 degrees from the vertical in the bare machine, or 15 degrees in the outfit carrying the boiler or reheater. In addition to this movement the cutting engine swings in the plane of the frame, with an angular range up to 45 degrees either side of the vertical.

Under Cutting Chambers consist of a heavy frame of cast iron mounted on four wheels, carried on steel axles running in babbitted boxes. At either end of the frame is a special guide shell provided with a swinging adjustment in both horizontal and vertical planes by means of which all angular conditions may be met, and cuts carried clear into the corners. The shells are hung very low, thus giving the least possible offset in cutting. The use of the two shells permits the channeler to work close to the wall and adapts the machine to deposits of any angle or dip.

The **bar channeler** consists of a carriage supporting the cutting engine mounted on two parallel bars along which it is moved automatically by means of a three cylinder engine actuating a traveling feed nut. The engine is automatically reversed at each end of the travel; or the stops may be set at any intermediate point.

The **quarry bar** consists essentially of the

single bar mounted on four tripod legs, two on either end. On the bar is mounted a carriage which supports the drill and which may be moved along the bar by means of ratchet and pinion and operated by a hand wheel.

The *gadder* consists of a heavy solid cast iron body mounted on four wheels forming a truck running close to the floor of the quarry. To one end of the truck is hinged a standard or arm which can be swung from nearly horizontal to vertical and firmly locked in any desired position. On the swinging arm or standard is a sliding carriage on which may be mounted by means of a cone pivot and bolt, any one of several sizes of rock drills, according to the work to be done. To raise or lower the drill and move it along the slide a chain is attached to the saddle and run up and over a shaft at the end of the swinging arm and down to a small drum on which it is wound by turning a crank conveniently placed for the operator. A special taper gib or wedge clamp is fitted on the saddle, wherewith the saddle is firmly locked to the swinging arm by simply throwing down a small lever when the drill has been raised or lowered to the proper position. At each corner of the truck frame is a large pointed steel pin or pointer, slipping freely in a guide socket and when the machine is properly arranged a blow from a sledge on each of these pins anchors the truck in place.

See AIR COMPRESSORS; ROCK DRILLS; PUMPS, COMPRESSED AIR; PNEUMATIC TOOLS; MINING AND MILLING MACHINERY; COAL MINING MACHINERY; CRUSHING AND GRINDING MACHINERY; TOOLS AND TOOL-MAKING; ETC.

Rock Falls, Ill., city in Whiteside County; on Rock River and on the Chicago, Burlington & Quincy railroad; across the river from Sterling, where connection is made with the Chicago & Northwestern railroad; about 110 miles west of Chicago. It was settled in 1867 by Augustus P. Smith. It is the commercial and industrial centre of the eastern part of the county south of Rock River. The water power is good; the chief manufactures are wire fencing, rivets, agricultural implements, butter tubs, flour, furniture, wooden-ware, wagons, carriages, and dairy products. The number of employees is about 1,000. There are seven churches, a high school, elementary schools, and a public library. The government is vested in a mayor and a council of six members, who serve two years; three members are elected annually. Pop. (1890) 1,900; (1900) 2,176.

Rock Fever. See MALTA FEVER.

Rock-fish, the name of several fishes usually found about reefs and on rocky bottom. In the United States the most prominent one is the striped or rock bass (see BASS); another is a grouper (*Epinephelus adscensionis*) of the West Indies, called by English-speaking fishermen "rock-hind." The name applies on the Pacific coast to the whole family *Scorpanida*, represented in the Atlantic by the dory or rose-fish (*Sebastes marinus*), which looks somewhat like a perch in form, reaches a length of two feet, has a rosy hue, and is excellent for the table; it may be known by its nearly uniform orange-red color, and its spiny head. The genus *Sebastes* contains more than 50 species of

Pacific coast rockfish, and several are constantly brought to market. Says Jordan: "*Sebastes pauci spinus*, the bocaccio, large and swift, is abundant in California. *Sebastes flavidus*, the yellow-tail rockfish, reaching a length of two feet, is one of the most valuable species. It is abundant from San Francisco to San Diego. *S. mystinus*, the black rockfish, is the most abundant species in rather shallow water about San Francisco. Another abundant species is the orange rockfish, *S. pinniger*, found from Puget Sound to San Diego. It reaches two feet in length, and is a common market fish; and the rasher (*S. miniatus*) is another important species, reaching a length of two feet and abundant from San Francisco to San Diego. The red rockfish (*S. ruberrimus*) is the largest species of all, reaching a length of 2½ feet; it is abundant from San Diego to Puget Sound, and is a valued food fish. Another important species is the yellow-backed rockfish (*S. maliger*), which is found from Monterey to Sitka. It is especially abundant northward, and reaches nearly two feet in length. The Spanish flag, *Sebastes rubrovinctus*, banded red and white, is perhaps the handsomest sea fish in our waters." Consult Jordan and Evermann, 'American Food and Game Fishes' (1902).

Rock Hind. See ROCK-FISH.

Rock-hopper, a rock wallaby or kangaroo (q.v.).

Rock Island, Ill., city, county-seat of Rock Island County; on the Mississippi River, and on the Chicago, R. I. & P., the Chicago, B. & Q., and the Chicago, M. & St. P. R.R.'s; 180 miles west by south of Chicago, opposite Davenport (q.v.), Iowa, a few miles below Moline (q.v.), and 125 miles, in direct line, north by west of Springfield, the State capital. The city is named after the island in the river between the cities of Rock Island and Davenport. The United States government and the Chicago, Rock Island & Pacific railroad built a combined railroad and highway bridge from Rock Island city to the island and thence to Davenport. The original cost of this bridge was \$1,000,000. Another bridge connects Moline with the island, thus making the three cities ("The Triplets"); one in many matters commercial and industrial. Rock Island has steamer connections with all the Mississippi ports. The island is three miles long, composed largely of limestone. A government arsenal and armory are on the island. That portion of the river between the island and Davenport is navigable, but on the west side of the island the river has been dammed by the United States government, thus furnishing Rock Island, Moline, the island, and Milan (a few miles below the city) with extensive water-power, which has contributed to the development here of a large and important manufacturing centre. Rock Island has excellent transportation facilities which make it of importance as a commercial city.

The chief industrial establishments are the arsenal, in which there are 2,000 employees; plow factory, which has 800 employees; lumber mills, 1,000 employees; railroad employees 500; brewery, 150 employees; oil-cloth factory, 150 employees, and a number of smaller industries which give employment to some hundreds of persons. The prominent public buildings are the

government arsenal, with \$10,000,000 of improvements; the court-house, which cost \$175,000; the high school, \$125,000; the library, \$75,000; Saint Anthony's Hospital; the 20 churches, and a number of fine business blocks. The Davenport mansion, on the island, is of historic interest. The educational institutions are Augustana College (Lutheran), opened in 1860, Villa de Chantal (Sisters of the Visitation), public and parish schools, several private schools, one city library, and three school libraries. The five banks have a combined capital of \$400,000. The government is vested in a mayor and a council of 14 members, each elected for a term of two years.

Rock Island was settled in 1826 by Colonel George Davenport. It was platted in 1835, and called Stephenson. In 1841 it was united with Farnhamburgh under its present name, and in 1849 was chartered as a city. When Colonel Davenport built his home on the island, in 1833, the neighboring places were a fort and an Indian trading post. Prior to his settling in this locality, in 1826, he had been there in 1816 with the government troops, when Fort Armstrong was established. Black Hawk, the Indian chief, often visited him here, and many of the people who are now regarded as "history makers" often visited Davenport in his island home. During the Civil War, the prison here was the place of detention of many Confederate prisoners. When the Mississippi Valley began to change from a raw producing region to a section sending to the world the finished and polished product of the best in manufacturing methods, Rock Island was among the leading cities which were quick to welcome the railroad and the manufactory, and the first to use the improved means presented to extend the commerce of the city. Pop. (1880) 11,659; (1890) 13,634; (1900) 19,493. Since 1900 there has been a large increase in population.

H. P. SIMPSON,

Editor 'Rock Island Argus.'

Rock Kangaroo or Wallaby. See KANGAROO.

Rock-melon. See MELONS.

Rock Ptarmigan. See PTARMIGAN.

Rock-rabbit. See HYRAX.

Rock Rapids, Iowa, town, county-seat of Lyon County; on the Rock River, and on the Illinois C., the Burlington, C. R. & N., and the Chicago, St. P., M. & O. R.R.'s; about 58 miles north of Sioux City. It is in an agricultural and stock-raising region. It has considerable manufacturing interests connected chiefly with farm and dairy products. It is the commercial centre of a large part of the county. Pop. (1890) 1,394; (1900) 1,766.

Rock River rises in the State of Wisconsin, 50 miles west of Lake Michigan; it flows south-southwest, receives several tributaries, enters Illinois, and crossing the State in a south-westerly direction, flows into the Mississippi a little below Rock Island. Its whole length is estimated at 330 miles, about 225 of which have been ascended by small steamers, though with some difficulty, owing to the various rapids. The region which it drains is one of great fertility.

Rock-roses. See CISTUS.

Rock Salt. See SALT.

Rock-snake, a name among English colonists for pythons generally; especially for *Python regius* of southeast Africa, which sometimes grows to a length of 15 feet.

Rock-soap, a hydrated silicate of aluminum, containing peroxide of iron and water. It is a variety of halloysite, is found only massive, is earthy, easily broken, black or nearly so, very soft, somewhat greasy to the touch, and adheres strongly to the tongue. Rock-soap is used for crayons, and is also useful, by reason of its saponaceous properties, in the washing of cloths, etc.

Rock Springs, Wyo., in Sweetwater County; on Bitter Creek, and on the Union Pacific railroad; about 250 miles west of Laramie. It is on a plateau, in a mountainous region in which there are extensive coal fields. The principal industries are connected with the mining and shipping coal. There are two banks, which have a combined capital of \$125,000. The educational institutions are a public high school, public and parish elementary schools, and a high school library. Pop. (1880) 763; (1890) 3,406; (1900) 4,363.

Rock-temples. In many parts of western India, as at Ellora, Elephanta, Karli, and Salsette Island, natural rocks have been cut into temples; as also into caves and forts. Out of India well-known instances of the same kind occur at Petra, in the Arabian Desert, at Abu-Simbel, in Egypt, and in China and Siam. See also CAVE-DWELLERS.

Rock-trout, a valuable fish (*Hexagrammus decagrammus*) of the coast of California and northward. It is one of the greenlings (q.v.), and is known northward as boregat and bodioron. It reaches a length of 18 inches, and is regarded as an excellent food-fish.

Rock-work. See MASONRY.

Rock-wren, a grayish-brown migratory wren (*Salpinctes obsoletus*) of the Rocky Mountain region which haunts the mountain gulches and makes a big rough nest in some rift of rock, or on a ledge. It has a charming song, and is likely to come familiarly about the mountaineer's cabin. Consult Coues, 'Birds of the Southwest' (1878).

Rock'all Islet, in the North Atlantic Ocean, 160 miles west of Saint Kilda, 260 miles north of Ireland, and 290 miles west of the mainland of Scotland, is an isolated conical rock of stratified granite, 100 yards in circumference, rising 70 feet above the sea, from a sandbank about 50 miles long and 25 miles broad. The vicinity is a cod-fishing ground for Scotch and English fishermen. The first known landing was made in 1810, and the islet was the object of a scientific expedition in 1896.

Rockefeller, rök'e-fäl-ër, **John Davison,** American capitalist: b. Richford, Tioga County, N. Y., 8 July 1839. After an education in the public schools of Cleveland, he there entered a mercantile establishment as clerk, and subsequently was made cashier and bookkeeper. In 1858 he became a member of the firm of Clark & Rockefeller, and in 1860 the concern entered the oil business as Andrews, Clark & Company. The firm, its style having been changed to William Rockefeller & Company, built the

JOHN D. ROCKEFELLER.

ROCKET — ROCKHILL

Standard oil works at Cleveland in 1865, and in 1867 the various interests with which John and his brother William were connected were consolidated into one corporation. In 1870 the Standard Oil Company was incorporated, with John Rockefeller as president. Increasing business led to the formation in 1881 of the Standard oil trust, which, however, was dissolved in 1892. Since that time Rockefeller has continued in control of the various separate companies in which he is the principal stockholder. His chief gifts have been to the University of Chicago; these, unconditional and conditional, aggregating more than \$20,000,000. He presented also to Cleveland real estate and cash to the value of \$600,000; to Vassar College a \$100,000 building and 3,000 volumes on Greek art and literature; to Tarrytown, N. Y., \$50,000 for a high-service water tower; to the American Baptist Missionary Union, \$400,000; and to Barnard College, \$1,375,000; to the General Education Board (total) \$43,000,000; etc.

Rocket, the name of several plants; one salad plant, chiefly used by Italians, is the *Brassica crucca*; the yellow rocket is the common winter cress, *Barbarca vulgaris*; but the sweet or dame's rocket is the most widely known. It is a tall perennial, with purplish or white single flowers in a loose raceme, and fragrant at night, much used in old-fashioned gardens.

Rockets. See PROJECTILES.

Rockford, rŏk'fôrd, Ill., city, county-seat of Winnebago County; on the Rock River, and on the Chicago & N. W., the Chicago, M. & St. P., Chicago, B. & Q., and the Illinois Central R.R.'s; 81 miles northwest of Chicago. It was settled in 1834, being the first settlement in the county; and was incorporated as a city in 1853. In 1890, it obtained a considerable increase of territory by annexation. It is built on both sides of the river, which is here crossed by three railroad and three highway bridges. A dam 800 feet long across the river secures excellent water power for manufacturing, and the city is one of the most important industrial centres of northern Illinois. The chief manufactures are agricultural implements and furniture; others are pumps, watches, silver-plated ware, knitting wool, paper, flour, and grape sugar. According to the census of 1900 the manufacturing establishments numbered 450, with a capital of \$14,126,834; in 1904 the number of employees was about 13,000. There are six banks with a combined capital of \$650,000, doing an annual business to the amount of \$22,969,727.53 (clearing-house, 1903). Rockford is surrounded by a fertile agricultural region, and with its railroad facilities is an important shipping point for the products of this district. The city is well built with wide, regular streets; among its notable public buildings are the Memorial Hall for Soldiers, the city-hall, the court-house, two hospitals and the public library; the library contains over 20,000 volumes. The public school system is of the best, and includes a high school, organized in 1857; there is also a Roman Catholic parish school; and the city is the seat of Rockford College (for women) and of Brown's Rockford Business College. The government is vested in a mayor and a council of 15, elected

biennially; the council has the power of appointing the city officers. There is an excellent water supply from five artesian wells, and the waterworks are owned and operated by the municipality. Pop. (1890) 23,584; 1900 31,051. Consult C. A. Church, 'History of Rockford and Winnebago County, Illinois' (1900).

J. STANLEY BROWNE,
Editor 'Morning Star.'

Rockford College, a college for women, located at Rockford, Ill. It was founded in 1849 as a seminary, and received its college charter in 1892. It has a collegiate department, department of music, and preparatory department; the collegiate work is in two courses, classical and general scientific, for the completion of which the degrees of A.B. and B.S. are conferred. In 1903 the ground and buildings were valued at \$150,000; the productive funds amounted to \$125,906, and the annual income to \$4,206. In 1903 the students numbered 81, and 95 in 1902.

Rockhampton, rŏk-hämp'tŏn, Australia, capital of the county of Livingstone, Queensland, on the Fitzroy River, about 420 miles by rail northwest of Brisbane, almost on the Tropic of Capricorn. It is enclosed by hills, and is the gateway to rich pasture lands, and the adjacent Mount Morgan mineral fields. It has considerable river traffic with the ports of Alma and Broadmount at the mouth of the river, 35 miles distant. Pop. (1901) 15,461.

Rock'hill, William Woodville, American diplomatist; b. Philadelphia 1 April 1854. He was educated at the Lycée Bonaparte and the Collège de France, Paris, and was graduated from the military school of Saint Cyr in 1871. He served with a French regiment in Algeria but returned to the United States in 1876. In 1881 he returned to France and resumed his oriental studies begun during his college course, and in 1884 entered the diplomatic service as 2d secretary of legation at Peking, China. He was *chargé d'affaires* at Seoul, Korea, 1887-8; visited China, Mongolia and Tibet during 1888-92 on exploring tours; was appointed chief clerk of the State Department in 1893; was made 3d assistant secretary of state a year later; and 1st assistant in 1896. He was minister to Greece, Rumania, and Servia, 1897-9, and the following year went as United States commissioner to China, where in 1901, under appointment as special ambassador, he signed the final peace negotiation. In October 1901 he resumed his duties as director of the Bureau of American Republics to which he was appointed in 1890. He has published 'Udanavarga, the Northern Buddhist' (1883); 'A Life of Buddha, and the Early History of his Church' (1884); 'Land of the Lamas' (1891); 'Diary of a Journey in Mongolia and Thibet' (1893).

Rockhill, S. C., town in York County; on the Southern and the South Carolina & G. E. R.R.'s; about 25 miles south-southwest of Charlotte, N. C. It is in a fertile agricultural region in which cotton is one of the principal products. The principal industries are connected with cotton and farm products and lumber. The Winthrop Normal College, with about 500 students, is located here. The banks

ROCKING STONE—ROCKLAND

have a combined capital of \$150,000. Pop. (1890) 2,744; (1900) 5,485.

Rocking Stone, or Loggan-stone, a block of stone, or a mass of rock, often of great size and weight, so nicely poised on a lower mass that it can be moved backward and forward with but little force. Some rocking stones are evidently artificial, others natural. The former appear to have been contrived by cutting out a mass of rock round the centre-point of the base of the block. The latter are generally granitic rocks, in which porphyry and feldspar are abundantly found. These ingredients being rapidly decomposed, and the sand and dust swept away by wind and rain, what was originally a solid rock becomes a group of pillars of irregular shape, separated by horizontal and vertical fissures. Gradually the edges of the block forming the pillar decay, and it assumes the appearance of two or more spheroidal rocks, one resting on the other. When the upper mass is so situated as to preserve its equilibrium notwithstanding the gradual wearing away of the base, a rocking stone is the result. Rocking stones occur in nearly all countries. In Great Britain they are found in Cornwall, Derbyshire, Lancashire, Yorkshire, and Wales, in the shires of Perth and Kirkcudbright, Scotland, and also in many places in Ireland. Much larger than any of these, however, is the rocking stone of Tandil in Argentina, 250 miles south of Buenos Ayres, which weighs over 700 tons, yet is so poised that it rocks in the wind and may be made to crack a walnut. Rocking stones are supposed to have been employed in ancient times for purposes of divination, the favorable or unfavorable oracle being determined by the number of vibrations. Consult Vincent, 'Around and About South America' (1890).

Rockingham, rōk'ing-am, Charles Watson-Wentworth, MARQUIS OF, English statesman: b. 13 May 1730; d. 1 July 1782. He was educated at Westminster School and Saint John's College, Cambridge, and in 1750 was created an Irish peer under the titles of Baron and Earl of Malton, later in the same year becoming also an English peer and Marquis of Rockingham by succession. He took his seat in the House of Lords in the following year and continued in practice with his Whig sympathies which he had inherited from his father. He took little part in politics, being a hesitating speaker and of mediocre talent, until 1765 when on the refusal of Pitt to take office, he became prime minister. His large wealth and powerful family position contributed to his elevation, and he had the invaluable assistance of his brilliant secretary, Edmund Burke. He took a friendly attitude toward the American colonies and favored the repeal of the Stamp Act, though he affirmed the right of Parliament to tax the colonies. He gave offense to the king for his support of the repeal principle and for refusal of allowances to the king's brothers, and was superseded by Pitt who returned to form a new ministry. His tenure lasted barely a year and his parliamentary career was inconspicuous until March 1782 when upon the fall of North's administration he was called upon to form a coalition ministry in which he held the treasury. The chief

events of his second term were the concession of legislative independence to Ireland, and the forcing the king to treat for peace with the United States on the basis of their independence. In accomplishing these ends credit is not given to Rockingham for enlightened statesmanship but rather for the adoption of a policy of opportunism. Consult Albemarle, 'Memoirs of Rockingham' (1852-3).

Rockland, Maine, city, and county-seat of Knox County. Set off from Thomaston in 1848, and incorporated a city in 1854. On a harbor which is an easterly extension of Penobscot Bay at its mouth; is very commodious and easily accessible: is naturally protected from storms coming from any direction except from the northeast and against these by a breakwater a little more than four-fifths of a mile long extending from the northern shore, and is marked by two lights, a revolving one at the extremity of the breakwater and a fixed one at Owl's Head, the promontory in which its southerly shore ends. The breakwater was begun by the U. S. Government in 1881, and practically completed in 1902. It cost about \$500,000. Rockland is connected with Maine Central R. R. system; 86 miles by rail from Portland; has steamboat connection with Boston, Bangor and Portland, and with all the important coast and island towns of eastern Maine as far east as Machias, a steamer running every day to and from Bar Harbor during most of the year. It is the centre and managing point of the Rockland, Thomaston & Camden Street Railway system, which has 21 miles of track extending northward to Rockport and Camden, and westward to Thomaston and Warren, and other electric railways. The region thus connected accommodates many summer tourists and visitors. Many wealthy people have built summer cottages at Camden, which place is especially notable for its combination of coast and mountain scenery. Within its limits are several mountain peaks varying in height from 1,000 to 1,500 feet. Mt. Battie is close to Camden Village and very near the shore, and Mt. Megunticook, a loftier peak, extends along the shore further north. Along the inner side of these two mountains a road has been cut, which extends along the shore of a large lake, and affords some grand and beautiful scenery. The lake furnishes water power for extensive manufactories, the water being used five times in the descent of little more than two miles from the lake to where it flows into the salt water at Camden Harbor. Norumbega, a fine stone house built by the late J. B. Stearns, the inventor of the duplex telegraph, is one of the handsomest private residences ever constructed in Maine.

Industries.—Shipbuilding has been for many years an important industry in this section, and fine vessels are constructed at Thomaston, Rockland, Rockport and Camden. A large part of the accumulated wealth has been derived from the building and operation of vessels. The Red Jacket, a clipper ship built at Rockland in 1853, is said to have made the passage across the Atlantic Ocean in a shorter time than it was ever made by any other sailing vessel. The principal industry of Rockland from a period that goes well back toward its settlement has

ROCKLAND — ROCKPORT

been the manufacture of lime. This is also carried on at Rockport and Thomaston. The Rockland limestone has a higher percentage of calcium than any other considerable deposit in the country, and is reputed in the building market to make the strongest mortar. The quality and quantity have been materially improved by the introduction of patent kilns, in 1850, and the more recent introduction of coal as fuel. In 1890 a steam railroad was constructed to transport the stone from the quarries in the rear of the town to the kilns on the water front. Formerly in the hands of independent operators, the industry passed over to the Rockland-Rockport Lime Co., which now controls the railroad and about three-fourths of the product. The company also operates a large factory for the manufacture of hydrated lime. The shipments to New York and other points are largely made in barges towed by tugs. The granite business is important. Two of the largest granite companies of the country have quarries in the vicinity, on the islands and on the mainland. These companies have handled some of the largest stones that have ever been wrought. The United States custom house in St. Louis, the postoffices in New York and Cincinnati, and many of the largest and handsomest buildings in the country have been built of Rockland granite. Steam and gasoline engines and blacksmiths' and granite workers' tools are manufactured. Fishing is carried on to some extent. Clams and sardines are canned, and more than 2,000,000 pounds of lobsters are shipped annually from here by rail. It is an important distributing point to the towns of eastern Maine.

The public buildings are the U. S. custom house and postoffice building, which is a handsome granite structure and cost about \$150,000, and the County court house and jail, which are of brick with granite trimmings and are on the same lot. The two cost something more than \$100,000. There are many handsome residences with fine grounds. In one of the cemeteries is a statue of white Italian marble of General Hiram G. Berry, who was a citizen of Rockland, and was killed at the Battle of Chancellorsville. It is the work of Franklin Simmons. Pop. (1900) 8,150.

LEWIS FREDERICK STARRETT.

Rockland, Mass., town in Plymouth County; on the New York, New Haven and Hartford railway; about 17 miles south by east of Boston. Until its incorporation as a separate town in 1874, it was a part of the town of Abington of the old Plymouth Colony. The town is pleasantly situated and its proximity to Boston and the convenience of transportation, give it an excellent trade and have made it a popular suburb of that city.

Rockland is a manufacturing place of growing importance. The census of 1900 returned 81 establishments with a combined capital of \$998,824, employing 1,071 persons at \$515,974 in annual wages. They used \$1,363,959 in materials and had a product valued at \$2,288,972. The industry first in importance was the manufacture of boots and shoes. Tacks are also extensively manufactured; and other factories

produce heels and shoe-findings, box board, shoe boxes, and soaps.

Rockland has well-built factory and public buildings, churches, schools, and attractive homes. It has two banks, a public library, and weekly newspapers. Pop. (1890) 5,213; (1900) 8,150.

Rockland, N. Y., a county in the southeastern part, bordering on New Jersey, and bounded on the east by the broadened expanse of the Hudson River known as the Tappan Zee and Haverstraw Bay. Nyack (q.v.), its largest town, is about 30 miles from New York, and in the vicinity, which is near the northern end of the Palisades of the Hudson and rugged and picturesque, are many handsome estates of New York business men. The county-seat is New City. The county is served by the New York, L. E. & W., the New Jersey & N. Y., and the West Shore R.R.'s; and while in many parts the soil is rocky, has, particularly in the eastern part, rich farms and large dairy interests. In the western section are the Ramapo Mountains, which contain the sources of the Ramapo and Hackensack Rivers. Granite, gneiss, limestone, trap, and red sandstone are extensively quarried, the last a good building-stone; the brick manufacturing is important; and large quantities of fruit, green vegetables, butter, and milk are shipped daily to New York. Many of the farmers "take boarders" during the summer months, and its healthfulness and its proximity to the city make Rockland County a popular vacation resort.

Rockland Lake, N. Y., a village of Rockland County, on the West Shore Railway, and on the Hudson River; four miles above Nyack and 30 miles above New York. It has only a small permanent population but is a popular vacation resort. Near here is Rockland Lake, a large sheet of clear, fresh water, from which 300,000 tons of ice are taken annually for use in New York.

Rockling, a European fish of the cod family and of the genus *Motella*, three species of which are regarded as valuable in British markets.

Rockport, rök'pört, Ind., city, county-seat of Spencer County; on the Ohio River, and on the Louisville, E. & St. L. railroad; about 100 miles southwest of Louisville, Ky., and 30 miles in direct line east by south of Evansville. It has steamer connections with all the river ports. It is on a bluff about 100 feet above high water. It is in an agricultural region in which grain and tobacco are the chief productions. The city has considerable manufacturing interests; the principal industrial establishments are flour and grist mills, foundry, machine shops, tobacco stemmeries, brick works, basket factories, creamery, wagon and carriage works, and furniture factories. It has a library founded in 1855. Pop. (1890) 2,314; (1900) 2,882.

Rockport, Mass., town in Essex County; on the Atlantic Ocean, and on the Boston & M. railroad; about 30 miles northeast of Boston.

It is on an island, the same on which Gloucester (q.v.) is located. The town embraces several villages. Electric lines connect Rockport and Gloucester and many points on the island. It was settled in 1690 by Richard Tarr and was known at first by the name "Sandy Bay." It is a famous summer resort; near Pigeon Cove, one of the villages, are a number of summer cottages. Part of the land is fertile and is used mainly for market gardening. Some of the places of interest in the vicinity are Dogtown Commons, where in the last of the 18th century a hundred families exiled themselves and lived in loneliness and poverty on those boulder strewn hills. Their numerous dogs gave the place its name. Other places of interest are Doctor's Run, The Headlands, and the Straitsmouth Life Saving Station at Gap Cove. In the northeastern part of the town are extensive granite quarries. The Boston post-office is built of granite obtained from these quarries. The chief manufacturing establishment is an isinglass factory which employs about 1,000 persons. There is one national and one savings bank. There are 12 churches, and the educational institutions are a high school, grammar and primary schools, and a public library, opened in 1871. Pop. (1890) 4,087; (1900) 4,592.

G. M. HASKINS.

Rockport, Texas, town, county-seat of Aransas County; on the Aransas Bay, an inlet of the Gulf of Mexico, and on the San Antonio & A. P. railroad; about 170 miles southwest of Galveston, and 135 miles south by east of San Antonio. It was settled in 1865 by Doughty and Mathis; was incorporated in 1865 and chartered as a city in 1871. It has steamer connections with all of the Gulf ports. It is on the peninsula, Live Oak Point; and the cool gulf breezes make it a popular summer resort. It has extensive fishing interests, especially oysters, and small game is plentiful in the vicinity. Rockport makes large shipments of hides, livestock, and fruit. There are five churches, a high school, elementary schools, and one national bank. The government is vested in a mayor and a board of aldermen, eight in number, who are elected biennially. Pop. (1890) 1,069; (1900) 1,153.

C. W. NEWMAN,
Editor (*Enterprise*.)

Rocks. Regarded as a whole, the earth, so far as we can examine it first hand and thus know it intimately, consists of three envelopes: (1) an outer gaseous envelope called the atmosphere; (2) a middle aqueous envelope called the hydrosphere; (3) an inner solid envelope called the lithosphere. These envelopes, considered together, including the lithosphere to a depth of 10 miles below the sea-level, have been shown to consist quantitatively of the following elementary substances:

| | | | | | |
|----------|--------|-------------|-------|----------|-------|
| O | 49.98% | Na | 2.28% | P | 0.09% |
| Si | 25.30% | K | 2.23% | Mn | 0.07% |
| Al | 7.26% | H | 0.94% | S | 0.04% |
| Fe | 5.08% | Ti | 0.30% | Ba | 0.03% |
| Ca | 3.51% | C | 0.21% | N | 0.02% |
| Mg | 2.50% | Cl:Br | 0.15% | Cr | 0.01% |

These 18 substances have been shown by F. W. Clarke (*Bulletin* 78 United States Geological Survey, pp. 34-43) to comprise the great bulk of the earth. The others, though outnumbering them three to one, can be ignored.

The above-named elements, so far as they enter into the composition of the lithosphere, rarely occur in the uncombined state, but are usually united chemically in different proportions to form those more or less definite chemical compounds called minerals (for example, quartz, SiO_2 ; calcite, $\text{CaO} \cdot \text{CO}_2$; olivine, $(\text{MgFe})_2\text{SiO}_4$); and minerals in turn are aggregated in various ways to form rocks. A rock may be defined as any accumulation or aggregation of one or more mineral species or substances, potential or actual, which constitutes a considerable component of the lithosphere; for example, granite, sandstone, limestone, clay, gravel, salt-beds. Although the crust of the earth or lithosphere has been shown to contain many hundreds of species of minerals, nevertheless the great bulk of it is composed of comparatively few species, and these have been termed the rock-forming minerals, in contradistinction to the great multitude of mineral species found more particularly in veins, and which, though of great importance economically, and of primary interest scientifically, are insignificant in amount when compared with the great mass of the more common minerals which go to make up a large portion of the earth. Thus gold, silver, platinum, the sulphide ores, and the minerals containing such rare substances as thorium, uranium, or radium, are negligible in quantity when compared with the mass of minerals composing the lithosphere.

The science or treatise of rocks, in its broadest scope, which considers them in all their relations, is called petrology or lithology, while the systematic and descriptive science of rocks, leading more particularly to their nomenclature, is called petrography. This distinction is implied in the etymology of the words. The latter term is used commonly in connection with the microscopic study of the igneous rocks.

Those minerals which are of especial importance as rock-formers can be grouped as follows:

GROUP I.

Quartz.—This group, for present purposes, may be limited to a single species, quartz, which is one of the most abundant of minerals, and is remarkable otherwise for its rather superior hardness, lack of cleavage, and indestructibility. It has strong crystallizing powers and, where allowed to grow intact, forms those beautiful hexagonal crystals with which all are familiar. Chemically it is an oxide of silicon, SiO_2 , that most abundant of all acid radicals, which, when combined with the bases alumina, lime, iron, magnesia, and the alkalis, soda and potash, in different ways, forms that most important of all classes of mineral substances, the silicates.

GROUP II.

Feldspars.—These are the most abundant of all rock-formers. They comprise a rather complex group of silicates, where alumina, the alkalis, potash and soda, and the alkaline, earthlime, are the bases. On a chemical and crystallographic basis they fall naturally into two series, the orthoclase and the plagioclase. Orthoclase, so called because of the rectangular cleavages lying parallel to the ortho- and clinopinacoids, is the type-species of the series. It is a silicate of potash and alumina having the chemical composition KAlSi_3O_8 , and is otherwise

ROCKS

known as potash feldspar. It belongs to the monoclinic system of crystallization, and is further known as the monoclinic feldspar. A part of the potash of orthoclase may be replaced by soda. In fact most of the analyses of the mineral show one per cent or more of the substance. This replacement of potash by soda can take place until these two constituents are present in nearly equal proportions without altering the monoclinic character of the species. Such an orthoclase is called soda-orthoclase. Soda-orthoclase has a chemical composition represented by the formula $(\text{Na},\text{K})\text{AlSi}_3\text{O}_8$, where soda predominates over potash. Under the microscope and between crossed nicols it exhibits a peculiar patchy appearance easily recognized.

Microcline, like soda-orthoclase, contains both potash and soda, $(\text{K},\text{Na})\text{AlSi}_3\text{O}_8$. It is, however, triclinic, but only slightly so, as the cleavage angle between the pinacoids varies but slightly from 90° ($89^\circ 30'$), hence the name. Between crossed nicols it exhibits a peculiar cross-hatching, due to multiple twinning according to both the pericline and albite laws, and is thus usually easily distinguished under the microscope. It stands at the head of the true plagioclase series, but inasmuch as it possesses a notable amount of potash, it may be classified with soda-orthoclase as representing the transition varieties of feldspar, lying between the monoclinic, potash, orthoclase series and the triclinic, soda-lime, plagioclase series.

The more typical plagioclases are represented by albite, oligoclase, andesine, labradorite, bytownite, and anorthite, which together constitute the albite-anorthite series. The theory of their constitution was propounded by Tschermak in 1864. He showed that the series can best be explained as a mixture of two extreme molecules, the one a pure soda-alumina silicate molecule, and the other a lime-alumina silicate molecule, found in anorthite. The intermediate varieties can be considered as varying mixtures of these two molecules. Representing the albite molecule by Ab and the anorthite molecule by An, the series is expressed thus:

| | |
|-------------|--|
| Albite | Ab($\text{NaAlSi}_3\text{O}_8$) |
| Oligoclase | Ab ₉₀ An ₁₀ to Ab ₉₅ An ₅ |
| Andesine | Ab ₈₀ An ₂₀ to Ab ₇₅ An ₂₅ |
| Labradorite | Ab ₇₀ An ₃₀ to Ab ₆₅ An ₃₅ |
| Bytownite | Ab ₅₀ An ₅₀ to Ab ₄₅ An ₅₅ |
| Anorthite | An($\text{CaAl}_2\text{Si}_2\text{O}_8$) |

This series of mineral varieties furnishes one of the best illustrations of an isomorphous mixture. It constitutes the albite-anorthite or soda-lime series of plagioclase feldspars, all of which are distinctly triclinic. The cleavage angle in this series varies from $93^\circ 31'$ in labradorite to $94^\circ 5'$ in albite.

Usually the plagioclase feldspars can be quickly and surely distinguished from the microcline or the orthoclase varieties by their characteristic multiple twinning, which is manifested in thin sections between crossed nicols by a distinct parallel banding that traverses the individual mineral plates. It thus becomes a comparatively simple matter, with thin sections under the microscope and between crossed nicols, to distinguish between orthoclase, which normally shows plain non-striated plates, soda-orthoclase, which has a peculiar patchy appear-

ance, microcline with its more or less indistinct cross-hatching, and plagioclase with its characteristic, sharply defined, parallel banding. Furthermore, the different varieties of the plagioclase series can be identified by their behavior in polarized light, more particularly by the variation in their extinction angles. In a general way this angle may be said to increase in size in passing from the albite toward the anorthite end of the series.

The feldspars are not only of primary importance as rock-formers, but the classification of rocks as at present accepted (more particularly the igneous varieties) depends largely upon the kind of feldspar which they contain.

The feldspars can be grouped in tabular form thus:

| (a) Monoclinic | | Cleavage angle |
|-----------------------|--|----------------|
| Orthoclase (sanidine) | KAlSi_3O_8 | 90° |
| Soda-orthoclase | $(\text{Na},\text{K})\text{AlSi}_3\text{O}_8$ | 90° (?) |
| (b) Triclinic | | |
| Microcline | $(\text{K},\text{Na})\text{AlSi}_3\text{O}_8$ | $90^\circ 30'$ |
| Soda-microcline | $(\text{Na},\text{K})\text{AlSi}_3\text{O}_8$ | $90^\circ 30'$ |
| Albite | $\text{NaAlSi}_3\text{O}_8 = \text{Ab}$ | $94^\circ 5'$ |
| Oligoclase | | $93^\circ 4'$ |
| Andesine | | $93^\circ 23'$ |
| Labradorite | | $93^\circ 31'$ |
| Bytownite | | |
| Anorthite | $\text{CaAl}_2\text{Si}_2\text{O}_8 = \text{An}$ | $93^\circ 13'$ |

Crystallizing as they do in two systems, the feldspars are said to be dimorphous; and the group may be described as consisting of a series of isodimorphous mixtures of the orthoclase albite and anorthite molecules.

Frequent parallel intergrowths of two varieties of feldspar occur; for example, albite may be intergrown with microcline or orthoclase, where the albite shows as narrow irregular bands of a different-colored mineral matter running across the cleavage surfaces of the orthoclase or microcline. Such intergrowths are called perthitic intergrowths or perthite because certain flesh-red feldspars from Perth, Canada, were first shown to be made up of such intergrowths. These intergrowths are sometimes so minute as only to be made out with the microscope, and then they are called microperthite. Brögger has suggested that certain soda-orthoclases are intergrowths of this kind in which the albite lamellæ are so narrow as not to be discoverable even with the highest powers of the microscope. For these supposed intergrowths he proposes the name cryptoperthite.

Similar parallel intergrowths of distinct mineral species may occur where quartz is intergrown with microcline. Such intergrowths of quartz and feldspar (usually orthoclase or microcline) are common in certain granite-like rocks called pegmatite, and are known as pegmatitic intergrowths, or graphic granite, referring to the resemblance of the curious V-shaped areas of quartz to cuneiform writing.

GROUP III.

Feldspathoids.—The minerals of this group are called feldspathoids or feldspar-like minerals, more particularly because of their chemical resemblance to the feldspars. There are but two species which need be considered here: leucite, which has a chemical composition expressed by the formula $\text{KAl}(\text{SiO}_3)_2$; and ne-

phelite, having the composition $K_2Na_6Al_3Si_6O_{34}$. Chemically leucite resembles orthoclase feldspar. In addition to being chemically like orthoclase, leucite, like its counterpart, alters to kaolin. But more interesting still is the fact that on decomposition it has been known to furnish orthoclase or orthoclase and muscovite.

Nephelite, as its chemical composition indicates, is analogous to the plagioclase feldspars. It is hexagonal in character. The decomposition of nephelite, like that of the plagioclases, usually results in the formation of some one of the zeolites, or more rarely it forms kaolin.

GROUP IV.

Mica.—Two species here are of widespread occurrence; one is muscovite, the white, silvery, potash variety, having a chemical composition corresponding to $H_2KAl_3(SiO_4)_3$. Chemically it is closely allied to orthoclase, and frequently results as an alteration product of that mineral. Optically it is distinctly biaxial. The second species, biotite, is dark-colored, owing to comparatively high percentages of iron. It also contains varying amounts of magnesia, and might thus be properly classed with the following group of minerals. It is very nearly uniaxial. It has the chemical composition $(HK)_2(MgFe)_2(AlFe)_2(SiO_4)_3$.

GROUP V.

The Ferromagnesian Minerals.—The minerals of this group take their name from the fact that they contain iron and magnesia as two of their prominent constituents. In addition they may contain lime and alumina in considerable amounts, also some alkali. The more important members of the group are included under the amphiboles and the pyroxenes, two species having numerous varieties, which pass into each other by isomorphous mixture. They form two parallel series which are both chemically and crystallographically analogous. Their relationship can best be shown by the following table:

| | |
|------------------|-----------------------------------|
| Amphibole | |
| (a) Orthorhombic | |
| Anthophyllite | $MgSiO_3$ |
| (b) Monoclinic | |
| Tremolite | $CaMg_3(SiO_4)_4$ |
| Actinolite | $Ca(MgFe)_3(SiO_4)_4$ |
| Hornblende | $\{ Ca(MgFe)_3(SiO_4)_4$ |
| Glaucophane | $\{ CaMg_3Al_2(SiO_4)_3$ |
| (c) Triclinic | $NaAl(SiO_3)_2, MgSiO_3$ |
| Ænigmatite | $Na_4Fe_9AlFe(Si, Ti)_{12}O_{38}$ |
| Pyroxene | |
| (a) Orthorhombic | |
| Enstatite | $MgSiO_3$ |
| Hypersthene | $(Mg, Fe)SiO_3$ |
| (b) Monoclinic | |
| Diopside | $MgCa(SiO_3)_2$ |
| Augite | $\{ CaMg(SiO_3)_2$ |
| Acmite | $\{ MgAl_2SiO_6$ |
| (c) Triclinic | $NaFe(SiO_3)_2$ |
| Rhodnite | $MnSiO_3$ |

The really important rock-forming amphiboles and pyroxenes are to be found among the orthorhombic and monoclinic varieties. And it is necessary to distinguish here between those which are aluminous and those which are non-aluminous, for the special reason that the former on alteration produce chlorite, while the latter produce serpentine.

One other important rock-former must be mentioned as belonging to this group—olivine,

so called on account of its usual olive-green color. It has the chemical composition $(Mg, Fe)_2SiO_4$, is orthorhombic in crystallization, and readily decomposes to serpentine.

GROUP VI.

Ores.—Minerals of this group have iron as their principal constituent, and frequently constitute ores of that substance. Included here are:

| | |
|-----------|-------------|
| Magnetite | $FeFe_2O_4$ |
| Pyrite | FeS_2 |
| Hematite | Fe_2O_3 |
| Ilmenite | $FeTiO_3$ |
| Chromite | $FeCrO_4$ |

Thus far the mineral species enumerated are mostly found as the essential constituents of that class of rocks hereafter to be described as igneous.

GROUP VII.

Accessory Minerals.—Those minerals which are usually of subordinate importance, and which are therefore more in the nature of accessory than notable rock-constituents, are included here:

| | |
|--------------|---|
| Cassiterite | SnO_2 |
| Rutile | TiO_2 |
| Titanite | $CaTiSiO_6$ |
| Apatite | $Ca_4(CaF)(PO_4)_3$ |
| Monazite | $(Ce, La, Di)PO_4$ |
| Corundum | Al_2O_3 |
| Spinel | $MgAl_2O_4$ |
| Garnet | $\{ Almandite$ |
| Grossular | $\{ Fe_3Al_2(SiO_4)_3$ |
| Staurolite | $Ca_3Al_2(SiO_4)_3$ |
| Chiaistolite | $Fe(AlO)_3(AlOH)(SiO_4)_3$ |
| Kyanite | $Al(AlO)_2SiO_4$ |
| Fibrolite | $(AlO)_2SiO_3$ |
| Cordierite | Al_2SiO_5 |
| Tourmaline | $(Mg, Fe)_4Al_4Si_6O_{18}$ |
| Topaz | $(Na, Mg_3Al_2)_3(AlFe)_6(BOH)_4Si_3O_{38}$ |
| Fluorite | CaF_2 |
| Zircon | $ZrSiO_4$ |
| Allanite | $(CaFe)_2(AlCaFe)_2AlOH(SiO_4)_3$ |
| Zoisite | $Ca_2Al_2(AlOH)(SiO_4)_3$ |

Some of the above minerals occasionally come to be of considerable importance, or may even constitute the bulk of the rock-mass. As a rule, however, they are of minor consideration and frequently even negligible.

GROUP VIII.

Secondary Minerals.—Minerals of this class have originated as the result of the decomposition or alteration of some previously existing primary or original mineral. The most noteworthy are:

| | |
|------------|-------------------------------|
| Kaolin | $H_4Al_2Si_2O_9$ |
| Serpentine | $H_4Mg_3Si_2O_9$ |
| Talc | $H_2Mg_3(SiO_3)_4$ |
| Chlorite | $H_8(Mg_3Fe)_3Al_2Si_6O_{19}$ |
| Epidote | $\{ Ca_2Al_2(AlOH)(SiO_4)_3$ |
| | $\{ Ca_2Fe_2(FeOH)(SiO_4)_3$ |

Kaolin results from the decomposition of orthoclase and other feldspars by the loss of some of the silica and alkalis, and by the addition of water (hydration). Serpentine results from the alteration of olivine and the non-aluminous hornblendes and pyroxenes by the loss of some of the magnesia and by an addition of water. Talc is formed by the hydration and partial decomposition of several of the lime-magnesia or non-aluminous ferromagnesian minerals, namely, tremolite, pyroxene (chiefly enstatite), phlogopite mica. Chlorite results most

ROCK FORMATIONS

- FIG. 1. Micro-photograph of thin section of granite, from Lokken, Norway, between crossed nichols, showing patchy appearance of soda-orthoclase (O), irregular plates of quartz (Q), and illustrating granitoid (xenomorphic or allotrimorphic) texture. The orthoclase shows twinning.
- FIG. 2. Micro-photograph of thin section of augite-syenite from Laurvik, Norway, between crossed nichols. The photograph shows only plain non-striated orthoclase and illustrates granitoid allotrimorphic or xenomorphic texture. The lines due to cleavage.
- FIG. 3. Micro-photograph of thin section of norite, from Hitteroe, Norway, between crossed nichols, showing banded plagioclase Labradorite (Pl), an opaque ore, ilmenite (I), and a monoclinic pyroxene diallage (D). The section also illustrates granitoid (xenomorphic or allotrimorphic) texture. A fringe of biotite surrounds part of the ore.
- FIG. 4. Micro-photograph of thin section of Perthite, between crossed nichols, showing intergrowth of albite (Ab) and microcline (Mi). The albite shows banding and the microcline cross-hatching.
- FIG. 5. Micro-photograph of thin section of graphic granite from New Bedford, Mass., between crossed nichols, showing parallel intergrowth of quartz (Q) and microcline (Mi). The latter shows cross-hatching.
- FIG. 6. Micro-photograph of thin section of porphyritic perlite showing sanidin crystals (S) in glassy ground mass. Dark wavy bands indicate flow in the mass before cooling (flow structure).
- FIG. 7. Thin section of porphyritic trachite showing sanidin (S) and biotite (B) in glassy ground mass. The crystals have been co-eroded or re-dissolved by the magma as is shown by their even curved boundaries.
- FIG. 8. Micro-photograph of thin section of tinguaita porphyry from the Odenwald showing idiomorphic crystals of nepheline (N), also an indistinct zonal structure in the same.
- FIG. 9. Micro-photograph of thin section of olivine norite, from Risor, Norway, showing long lath-shaped crystals of plagioclase (Pl), augite with characteristic nearly rectangular cleavage (A), olivine altered on the margins to serpentine (Ol), and an opaque ore (M).
- FIG. 10. Micro-photograph of thin section of diabase between crossed nichols, showing ophitic structure. It contains plagioclase (Pl), augite (A), and magnetite (M).
- FIG. 11. Micro-photograph of thin section of Essexite from Gran, Norway, showing hypidiomorphic augite crystals (A), and opaque grains of magnetite (M) in a fine ground mass of plagioclase. It illustrates hypidiomorphic-porphyrific texture.
- FIG. 12. Porphyritic basalt (melaphyre) with phenocrysts of plagioclase (Pl) in a dense micro-crystalline ground mass consisting of augite, magnetite and a second generation of plagioclase crystals.

frequently from the alteration of the aluminous hornblendes and pyroxenes. Epidote also results from the alteration of the aluminous varieties of hornblende and pyroxene, especially those having some lime in their composition.

GROUP IX.

Precipitations from Aqueous Solutions.—

The following minerals occasionally form impositions as at present recognized as possible from solution in water:

| | |
|---------------------------------|---|
| Salt | NaCl |
| Gypsum | $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ |
| Aragonite or Calcite | CaCO_3 |
| Hydrous Silica | $\text{SiO}_2 \cdot n\text{H}_2\text{O}$ |
| (Geyserite or Silicious Sinter) | |

Origin of Rocks.—Two alternative hypotheses are at present recognized as possible explanations of the origin of the earth: (1) the old so-called nebular hypothesis, propounded by Kant and Swedenborg and later elaborated by Laplace and others; (2) the newly proposed accretion theory or planetesimal hypothesis propounded by Professor Thomas C. Chamberlin of the University of Chicago. The first of these supposes that the earth was originally in a gaseous condition, from which, under its own gravity and by a radiation of its heat, it passed into a fluid state and thence to a solid form. The "original crust" of the earth (lithosphere) formed at the surface as the result of a cooling of the molten materials of the globe. Furthermore, the earth may have solidified from the centre outward as the result of pressure. Others suppose that the original crust was not only added to from below by the crystallization of molten material, but also increased in thickness from above by chemical precipitations from the intensely heated hydrosphere. The accretion theory, on the other hand, supposes that the earth as a whole never was in a gaseous or even fluid condition, but was built up by the infalling of cold, solid, discrete particles of matter called planetesimals; that the present internal heat is the result of pressure due to gravity. Adherents of both these hypotheses agree, however, that the oldest known rocks, the original or primitive rocks from which all others have been derived, are of igneous origin, that is, were once in a molten condition, from which they cooled to the solid state, and in so doing formed more or less thoroughly crystalline aggregates of different kinds of minerals.

In discussing the origin and descent of rocks we must therefore start with the more common igneous varieties, and show how they have furnished materials for the others.

Rock Disintegration.—Granite is one of the most abundant and widespread of igneous rocks, and is a most important species among the numerous other primitive rocks of the lithosphere. The changes which take place in it in the process of its decay can be taken as illustrative of those which take place in the disintegration of all other primitive rocks. Granite consists of quartz, orthoclase feldspar (with some soda-orthoclase microcline or plagioclase), and light or dark mica, or both, or perhaps hornblende in place of the micas.

On decomposition under the influence of atmospheric agencies, it falls to a more or less rusty, clayey mass of sandy or gravelly material,

the sandy or gravelly part consisting of angular fragments of the original quartz (which is practically unaffected by atmospheric agencies), and fragments of still undecomposed feldspar. The clayey portion of the alteration products results from the decomposition of the feldspar and consists largely of kaolin, which in a pure condition is a white powdery or plastic material, according to whether it is dry or wet. It is usually stained rusty brown by iron oxide, which results from the decomposition of any ferromagnesian constituent contained in the rock, or from small particles of some one of the ores which are quite certain to have been present in small amounts. Certain constituents of the original minerals are carried off in solution: the alkalis and a part of the silica of the feldspars; also a portion of the iron of the ferromagnesian minerals, together with some of the magnesia and much of the lime that may have been present as a minor constituent.

This mass of loose, more or less rusty, incoherent material remaining behind is termed residual granite. Rocks of whatever nature are in like manner subject to decomposition by atmospheric agencies, and their residual materials everywhere cover the greater portion of the surface of the underlying rocks, and constitute what is termed mantle-rock or detritus. A part of this mantle-rock consists not of residual material in the strict sense, but is made up of angular fragments of various sizes, which have been broken from the rock-masses by the action of frost. At the foot of nearly every steep cliff is to be found an accumulation of angular rock-fragments called talus, rock-slide, or breccia.

Removal of Rock-waste and Its Deposition in the Form of Sediments.—Most of the various materials of the mantle-rock, whether residual or fragmental, find their way sooner or later, chiefly by the action of rain or frost, to the neighboring streams, and are borne by them to the rivers, which in turn transport them, after numerous halting-periods, to the sea or to smaller bodies of salt or fresh water. In this process of transportation the angular rock-fragments are reduced by attrition to rounded pebbles. The angular grains of quartz also become rounded and water-worn, while much of the material becomes reduced to an impalpable mud. These more or less finely comminuted and abraded materials are distributed along the shores of lake or sea. Gradually the finer, more easily suspended and transportable materials are carried out into deep water, the finest and most impalpable muds being transported farthest from the shore; so that, broadly speaking, the washings from the land surface become distributed over sea and lake bottom in order of fineness, beginning with the coarsest gravelly materials at the shore-line, and growing successively finer toward the deep water, where finally only the impalpable silts and muds are deposited.

Stratification.—In addition to this more or less gradual horizontal change from coarse to fine materials brought about by the transporting power of water, there is always to be observed a much more sudden and abrupt change vertically, by which materials of various sorts and degrees of fineness are arranged by the sorting power of the same medium (water) into horizontal beds of varying thickness, which are separated from each other by sharply defined planes of demar-

cation called sedimentation or bedding planes. Beds which consist of the same material mineralogically are called strata. But a stratum may be made up of thinner beds, owing to a difference in the fineness of the material which composes it. These subdivisions of a stratum are called layers, and layers in their turn may be composed of extremely thin beds, only the very small fraction of an inch in thickness, called laminae. Strata vary in thickness from a few inches to several feet. All materials deposited in water are called sediments; and all sediments were originally deposited in nearly horizontal position. These nearly horizontal strata slope or dip slightly toward deep water, and this slight inclination is known as initial dip. All materials deposited in water are stratified, and this is the chief characteristic of all rocks so formed. The converse statement of this is that all stratified rocks are of aqueous origin. Rocks of this character are called sedimentary.

Consolidation of Sediments into Coherent Rock-masses.—Sediments have accumulated to a very great thickness during geologic time. Those sediments which have been deeply buried and have been subjected to great pressure have been made to cohere either as a direct result of this pressure or by a cementing together of the particles by mineral substances in solution; namely, silica, carbonate of lime, carbonate of iron precipitated as the oxide.

The Metamorphism of Sediments.—Those most ancient of all sediments which were derived from the disintegration of the original or primal rocks of the lithosphere, and which were first deposited in the primordial seas, have been so deeply buried in the crust of the earth as to have been affected by the uprising heat of the earth's interior. This heat, united with the tremendous pressure exerted by the superincumbent mass of sediments and the dissolving effect of the intensely (super-) heated moisture present, reduced the sediments to a partly fused, partly dissolved, more or less pasty condition (aqueo-igneous fusion), from which they subsequently cooled, thereby changing into thoroughly crystalline masses, consisting of distinct mineral aggregates more or less resembling the crystalline rocks of the igneous type, but different from the latter chiefly in this, that the original stratification (bedding) planes are still visible. Such rocks are utterly changed in everything except their chemical composition from their original condition and appearance, and are said to be metamorphosed. As a class they compose the metamorphic rocks. It is not alone these ancient sediments which have suffered transformation. Sediments of every geologic age have been found in some quarter of the globe in the metamorphosed condition.

General Classification of Rocks.—All rocks can be classified according to their origin as follows: (1) igneous; (2) aqueous; (3) æolian; (4) glacial; and (5) metamorphic.

Igneous Rocks.—(Definitions depending upon external form and mode of occurrence.) Igneous rocks comprise all those portions of the lithosphere which are or were in an intensely heated and more or less fluid condition and which have subsequently solidified by cooling into massive, more or less crystalline bodies of varying sizes and shapes. They occur as in-

trusions into or replacements of some previously existing rocks of the lithosphere, either sedimentary, metamorphic, or igneous. Where a huge mass of molten material slowly melts its way from some deep-seated portion of the earth up into the overlying rocks by dissolving them and incorporating them in its own mass, and subsequently cools there, slowly, without ever reaching the surface, forming a great irregular body of coarsely crystalline matter frequently scores of miles in extent, we have what is termed a batholith. In its molten condition it would be termed a magma and the reservoir in which it was contained would be called a magma basin. The period of its existence as a fluid mass is termed the intratelluric (within-the-earth) period. It might have extending from it (usually upward) irregular, more or less elongated, arm-like processes called apophyses. Should cracks or fissures form, they would be instantly filled by the inrush of fluid substance, which would solidify with comparative rapidity to form dikes. In stratified rocks dikes usually cut at some angle across the strata. Where the molten material intrudes itself between the strata parallel to the bedding planes in broad sheets, it is called an intrusion-sheet or sill. Where the overlying strata become lifted and arched upward into a huge dome without breaking above and letting the fluid rock escape, the solidified lenticular mass constitutes a laccolith or laccolite. Where the molten rock actually escapes to the surface by means of a fissure or other conduit, and flows out over it in a broad sheet, it is termed a flow, lava-flow, or intrusion-sheet. The interval of time elapsing between the outbreak of the magma from its reservoir and its subsequent cooling to the solid state is termed the effusive period. If the conduit is rudely cylindrical the lava accumulates about the vent, forming a lava or volcanic cone. Subsequent erosion may entirely remove the cone and expose the cold lava in the conduit, to which the term volcanic neck is applied. In fact it is only through the exposure of these deep-seated masses of cooled igneous material by erosion that we are enabled to study them. Over the more ancient land areas many miles of rock, vertically measured, have been removed, laying bare the underlying rocks to a corresponding depth.

The Modern Conception of Rock Magmas.—

The popularly accepted idea of lava is that it is rock which has been fused by great heat. In fact the older conception of scientific men was that magmas consisted of fused rock-masses. Recent opinion, however, based on the revelations of the microscope and experiments in the synthesis of minerals and rocks, tends to regard them as solutions of one mineral substance in another or of several mineral substances mutually in each other. One of the chief reasons for thinking them such can be stated as follows: If magmas are fusions then the individual mineral constituents potentially present in them should crystallize out according to their fusibilities, beginning with the least fusible, but they do not. On the other hand, as the magma slowly cools, the first individual mineral species makes its appearance when the point of saturation for that particular species is reached, and the others follow in the order of their solubilities. For example, in granite (which consists

ROCKS

of quartz, feldspar, and mica or hornblende, with some accessory constituent, such as apatite, or zircon, and, it may be, also a small amount of one or more of the ores), the order of crystallization is: (1) the ores with apatite and zircon; (2) mica or hornblende; (3) feldspar; (4) quartz. Quartz is the least fusible, and should appear first under the fusion theory. As a matter of fact it appears last. In short, all of the materials appear in the reverse order of what we would expect if they are true fusions. But they do appear in the order of their solubilities. Pressure, however, exerts an important influence upon the solvency of a substance, and as this is variable the order of appearance is not absolutely fixed. Moreover, heat, the most important factor involved, is very variable, and still farther modifies the problem.

The Splitting or Cleavage of Magmas (Spaltung).—When a magma cools, the first minerals to appear are the ores (with apatite, titanite, zircon, etc.); following these, the basic ferromagnesian constituents; then the more basic plagioclase feldspars, followed or overlapped by the orthoclase varieties; and last of all, quartz, if more than enough exists for the formation of the silicates. Obeying the principle of diffusion, the first minerals to form—the more basic ones—tend to accumulate on the cooling walls, that is, at the periphery of the magma-basin; and the other minerals arrange themselves rudely in concentric zones, each zone toward centre being successively more acid, until at the centre the magma becomes comparatively acid and may, after solidification, consist largely of such minerals as orthoclase and quartz. This arrangement of the minerals by diffusion before crystallization results in the rude separation of an originally uniform magma into several magmas of different chemical compositions, which, on cooling, furnish rocks of different mineralogical compositions. This process is termed the cleavage of magmas.

Definitions depending upon internal characteristics will next be considered.

Texture.—The fluid magmas of igneous rocks may be compared to molten glass. If the cooling period be long the individual minerals form comparatively large crystals. If it be short the crystals are correspondingly small. If it chills so suddenly that the molecules of the different mineral compounds do not have time to unite to form crystals, but are caught just as they existed originally in the fluid magma, the result is a volcanic glass. Rocks in which the crystals are 5 millimetres or more in diameter may be called coarse-grained; rocks in which the crystals range in size from 1 to 5 millimetres, medium-grained; and those in which they are 1 millimetre or less in diameter, fine-grained. Rocks in which all of the original magma has individualized or crystallized, to form minerals of some sort, and in which there is no undifferentiated material remaining behind in the form of glass, are called holocrystalline. All rocks in which the crystals are large enough to be seen with the unaided eye are termed phanocrystalline, or phaneric. Those rocks in which the crystals are too small to be distinguished megascopically are called aphanitic. Many aphanitic rocks, however, under the microscope are seen to be holocrystalline and to consist of small crystals of minerals which can be specifi-

cally identified with the aid of that instrument. For these rocks the term microcrystalline has been proposed. But the crystals, though recognizable, may be too small to be specifically identified even with the microscope. Such rocks are called microcryptocrystalline. Volcanic glasses show only embryonic crystals (microlites, trichites, crystallites) imbedded in textureless glass. Such rocks are said to be vitreous or glassy.

If during the entire period of solidification the conditions of cooling remained the same and the entire process of cooling of a deep-seated magma was slowly and quietly accomplished in the magma-basin, unattended by any effusive period, the rock would be coarse (to fine), evenly-granular. In rocks cooling under these circumstances the growing crystals have usually interfered with each other in such a way as to mutually destroy their crystal boundaries, forming irregular interlocking grains, with no one diameter much greater than the others. In other words, the grains are irregularly rounded. A texture of this sort is characteristic of the granites, and is called the granitic or granitoid texture. The term allotrimorphic, referring to the fact that the crystals do not possess their own boundaries, is applied to the same texture, and a still newer term, xenomorphic, has recently been proposed. Where the majority of the crystals do retain their crystal boundaries, the resulting texture is called idiomorphic or automorphic. If the crystal boundaries are only faintly or imperfectly discernible, the structure is said to be hypidiomorphic.

The period of intratelluric solidification may be interrupted by an effusive period; in which case those crystals which had begun to form, and may have reached considerable size, during the intratelluric interval, are carried by the eruption into other surroundings, where the cooling process may be much accelerated. A second generation of smaller crystals would then form about the large well-formed ones, imbedding them in a fine-grained or possibly aphanitic ground-mass, producing what is termed porphyritic texture. Two or more generations of crystals may thus be recognized. The well-defined crystals of the first generation are usually pronouncedly idiomorphic, and are called phenocrysts. The term felsite is applied to the aphanitic ground-mass of the acid rocks.

The crystals of some one mineral species in a rock may have one diameter much larger than the others. The crystals then appear distinctly lath-shaped in thin section under the microscope. This form of crystallization is especially common with the plagioclase feldspars. These laths of plagioclase are enclosed by crystals of another species. This texture is common, and in the scheme of classification of igneous rocks at present accepted is called into rather prominent requisition. It is known as the ophitic texture.

Flow-structure is exhibited by the parallel arrangement or orientation of minerals in lines which indicate the direction in which the fluid rock had been moving before solidification took place, or while it was in a viscous state.

Classification of Igneous Rocks.—The classification of igneous rocks as at present widely accepted is based upon three things: (1) chemical composition; (2) mineralogical composition; (3) texture. (The proposed 'Quantitative

ROCKS

Classification of Igneous Rocks,' published jointly by Cross, Iddings, Pirsson, and Washington, University of Chicago Press, 1903, is the most logical and satisfactory attempt at a thoroughly scientific classification of the igneous rocks yet proposed, and bids fair to be epoch making.)

Chemical Composition.—The chemical composition of igneous rocks is primarily expressed in terms of silica percentage. Rocks which contain from 60 to 80 per cent of silica are called acid. Most of these rocks contain free quartz; those which range from 40 to 60 per cent in silica are called basic, and rarely possess free quartz in any considerable amount; while those which fall below 40 per cent are termed very basic. Generally speaking, as the silica percentage declines the percentage of the bases (lime, iron, magnesia) increases. This change in chemical composition from acid to very basic is indicated by change in color, the acid rocks being light ashly gray, while the very basic are dark.

Mineralogical Composition.—Quartz is more or less abundant in rocks of the acid division, but soon disappears in passing toward the basic end of the series. Orthoclase is the dominant feldspar among the acid rocks, but even here the plagioclases are more or less common. Among the basic rocks the plagioclases prevail, and in a general way change from the albite to the anorthite variety as the more basic rocks are approached, but fail entirely in most rocks of the very basic division.

The ferromagnesian minerals are subordinate, almost negligible, in the very acid rocks. They become dominant in the basic and constitute the bulk of the very basic rocks.

The ores, chiefly magnetite, chromite, and ilmenite, are found more or less sparsely disseminated through all three divisions, but they become notable constituents among the basic and very basic rocks, and may even segregate to form important bodies of ore.

Texture.—As already explained, magmas which solidify deep within the lithosphere usually form coarse (to fine) evenly-granular rock-masses, having the granitoid texture, although they may be more or less porphyritic or idiomorphic in character. These deep-seated rocks are called plutonic. Where eruption takes place those rocks which solidify somewhere between the magma-basin and the surface (as intrusion-sheets, dikes, laccolites, etc.) are called intrusive, while those which cool subaerially (or it may be beneath bodies of water) are called effusive or extrusive. While neither the plutonic, intrusive, nor extrusive members are limited to any one kind of texture, it is true that the plutonic rocks are more frequently granitoid, and the intrusive and extrusive members even-fine-grained, felsitic, aphanitic, or porphyritic in texture, while the textureless volcanic glasses are nearly always extrusive.

Rock-families: I. Acid Division; Granites.—The granites are plutonic rocks occurring frequently as huge irregular masses which have slowly melted their way up from some deep-seated region into the more ancient and then deeply-buried portions of the lithosphere; or they may occur as apophyses or dikes given off from some parent mass. Mineralogically they consist of quartz, dominant feldspar of the orthoclase variety (with subordinate amounts of

soda-orthoclase, microcline, or oligoclase), and muscovite or biotite mica, or both. Typical granite has muscovite. Where biotite alone is present it is called granitite. Where hornblende or tourmaline replaces the mica, the rock is called hornblende- or tourmaline-granite. Where mica fails and the rock consists of quartz and orthoclase, it is termed aplite. Where feldspar fails and only quartz and mica remain, the rock is called greisen. Aplite and greisen are the most acid forms of the granites. As accessory constituents might be mentioned, zircon, allanite, cassiterite, rutile, titanite, magnetite. By a gradual decrease of quartz the granites pass imperceptibly into the syenites (to be described later), and by similar changes into the diorites.

There is a form of granite called pegmatite, which is found in veins or dikes. It is very coarsely granular. The crystals of feldspar sometimes measure a foot or more in diameter, while the quartz and muscovite crystals correspond in size. Pegmatite is the source of nearly all of the white mica of commerce. It is also remarkable as being the home of a variety of extremely rare minerals—compounds of thorium, lanthanum, yttrium, etc.—among which may be mentioned uraninite or pitch-blende, the present source of radium. Pegmatite is characterized by the interesting parallel intergrowth of feldspar and quartz, already referred to, called graphic granite. Pegmatite is particularly noteworthy, however, as having been deposited from an intensely heated aqueous solution, perhaps from vapor of water (mingled with other gases, such as carbonic acid, hydrofluoric acid, boracic acid, etc.), which was under such great pressure that it bordered on the fluid condition. The minerals of pegmatite, more particularly the quartz crystals, are frequently filled with fluid inclusions of water or carbonic acid. A great variety of minerals and a few rocks are considered to have been formed in this manner, and are said to be of pneumatolytic origin (Greek, *πνεῦμα*, to turn into air), and such processes are termed pneumatolytic processes. Furthermore, since these processes usually succeed some great volcanic outbreak, they are termed post-volcanic processes.

The granites as a family have a range in silica which varies between 65 and 80 per cent.

Where a magma of the chemical composition of granite erupts, it may form dikes, sheets, or flows. The rocks may have a variety of colors, but they are prevailing light ashly gray. Where crystalline, they possess the same mineral constituents as granite, except that the feldspar is apt to be the glassy variety of orthoclase called sanidine. The porphyritic texture prevails among the intrusive and extrusive forms alike.

The geologically older intrusives of this family are called quartz or orthoclase porphyry according to whether the phenocrysts imbedded in the felsitic ground-mass are quartz or orthoclase. The strictly extrusive forms of granite are known as rhyolites (from the Greek word which means to flow), so called because of the flow-structure which is commonly developed in them. The rhyolites are rarely holocrystalline, containing nearly always more or less glass, and occasionally consisting wholly of it. These entirely glassy forms of rhyolite are called obsidian. Perlite and pitchstone are varieties of obsidian. Occasionally the rhyolites are frothy

ROCKS

in character, due to the rapid escape of steam resulting from the relief from great pressure. This form is known as pumice. Rhyolite is also called liparite because extruded abundantly from the volcanoes of the Lipari Islands.

Syenite.—The hornblende granites, as already explained, are those in which the mica has been replaced by hornblende. An occurrence of such a rock at Syene (now Assuan) on the Nile, was called syenite from its locality. Of late the term has been restricted to quartzless rocks consisting primarily of orthoclase and hornblende. Rocks of the syenite family usually carry varying amounts of plagioclase, and may contain subordinate quartz. Apatite, zircon, titanite, and magnetite are uniformly present as accessory constituents. In texture they are granitoid and, by an increase of quartz, grade over completely into the granites, or by an increase of the plagioclase pass over into the diorites (described below). Where augite replaces the hornblende the rock is called augite-syenite; where mica replaces it, minnette. Nepheline and orthoclase constitute nepheline-syenite.

The range in silica percentage for the typical syenites is between 55 and 65 per cent.

When a magma having the chemical composition of a typical syenite erupts it forms dikes, sheets, and flows, closely resembling the eruptive forms of granite, but without quartz. The loosely applied mining term porphyry is used indiscriminately for the eruptive members of both the granite and syenite families. True eruptive syenite, however, is called trachyte, from the Greek word which means rough. The most typical occurrences are light-colored, ashy-gray rocks, either aphanitic or porphyritic in texture, with usually some glass in the ground-mass. When porphyritic the phenocrysts are of the glassy variety of orthoclase called sanidine. In fact, the entire feldspathic constituent is chiefly of this variety.

The eruptive form of nepheline-syenite is called phonolite because of the ringing sound which thin plates make when struck with a hammer, and certain dike-rocks of the mineralogical composition of nepheline-syenite with pronounced porphyritic texture, are called tinguaites.

Rock-Families: II. Basic Division; Diorites.—These diorites are plutonic rocks having a silica percentage running from 50 to 65 per cent. They are of medium acidity, and the magmas from which they are formed may be considered as approaching closely the hypothetical parent magma from which, by the process of cleavage, the other rock-families, acid, basic, and very basic, may be thought of as having originated. Mineralogically they consist of hornblende and plagioclase feldspar. Those in which mica replaces a part of the hornblende are called mica-diorites, while the same constituents plus quartz go by the name of quartz-diorites, granite-diorites, or tonalites. These rocks mark the transition to the granites. Augite-diorites are rocks of the diorite type, in which hornblende is replaced in part by augite. They grade over into the gabbros.

Certain intrusive (dike) rocks of the mineralogical composition of the diorites are called camptonites, while other similar intrusives having both biotite and augite are called kersantites.

Extrusive rocks having the chemical and mineralogical composition of the diorites are called andesites. Typical andesites are aphanitic, felsitic, or porphyritic in texture, and closely resemble the trachytes, the main distinction being that they contain plagioclase (andesine or oligoclase) instead of orthoclase. The ferromagnesian constituent is hornblende, but may be either biotite or augite. The rocks are named because of their common occurrence in the Andes Mountains.

Acid andesites containing free quartz are known as dacites, a name derived from the old Roman province of Dacia, now a part of Hungary.

The Gabbros.—The gabbros are coarse- to fine-granular, granitoid rocks of plutonic origin, having a silica percentage ranging from 45 to 55 per cent. As originally defined they consisted of plagioclase (labradorite) plus a pyroxene, of the variety known as diallage; but more recently the name has been applied to a great variety of rocks consisting of a plagioclase (at least as basic as labradorite) plus any kind of pyroxene, either monoclinic or orthorhombic. If olivine be present it is known as olivine gabbro.

The name norite is applied to that member of the gabbro family which consists of plagioclase and enstatite. If olivine be present it is called olivine-norite. The ferromagnesian constituent may fail and the rock thus consist of labradorite feldspar alone, in which case it is known as anorthosite (from the French word for triclinic feldspar).

The accessory mineral constituents are apatite, titanite, ilmenite, magnetite. The first and last mentioned are usually abundant, and the latter may segregate to form ore deposits.

Diabases.—These may properly be discussed in connection with the gabbros, for they have the same mineralogical composition, and while they may occur as true plutonic rocks they occur commonly in the form of dikes or sills, and may be considered as the intrusive form of the gabbros. Their chief distinguishing feature perhaps is their texture, which, under the microscope, if not in the hand-specimen, is seen to be ophitic. This, in short, is the essential distinction between the gabbros and the diabases as ordinarily considered. In granularity they range from coarse to aphanitic. They are sometimes strikingly porphyritic, with perfect automorphic phenocrysts of augite imbedded in an aphanitic, ground-mass of augite and plagioclase (labradorite or anorthite). Dolerite is a term used interchangeably with diabase, but refers more particularly to the porphyritic varieties. The basalts or traps are the dense black aphanitic extrusive forms of diabase or dolerite, but they grade over into the diabases by imperceptible stages. The basalts constitute great surface flows of unparalleled extent, covering thousands of square miles. On cooling they frequently break, by shrinking, into hexagonal prisms, which have their long diameters normal to the cooling surfaces. This is known as the columnar structure of basalt, so famously exhibited at the Giant's Causeway, on the northeast coast of Ireland.

Olivine is a more or less constant mineral in the basalts, which have been divided into the

olivine-free and olivine-bearing varieties. More rarely they contain nepheline or leucite in considerable amounts, and are then called tephrites. If both olivine and leucite or nepheline are present they are termed basanites.

Very Basic Division: Peridotites, Pyroxenites, Hornblendites, and Dunites.—Rocks of this division, as already explained, include those from which not only free quartz has disappeared, but also the feldspars, at least as notable constituents. They consist essentially of a mixture of ferromagnesian constituents plus one or more of the ores. Olivine and pyroxene (usually augite) together constitute peridotite (from the French word for olivine). If hornblende be substituted for augite the rock is known as hornblende-peridotite. If the rock consists essentially of pyroxene it is called pyroxenite; or of hornblende alone, hornblendite, or of olivine alone, dunite. They have as accessory constituents magnetite, chromite, ilmenite, and apatite. Chromite rarely occurs in such abundance in the peridotites as to be of economic value.

A certain rare basaltic rock of the mineralogical composition of peridotite, consisting of augite and olivine in a glassy ground-mass, occurs at Limburg in Kaiserstuhl, Baden. It is called limburgite. Dense porphyritic rocks consisting of augite and magnetite in a glassy ground-mass represent the effusive member of the pyroxenites, and are called augitites.

Rocks of Aqueous Origin.—Rocks deposited in water are called sedimentary, and are always stratified. In this respect they are distinguished from typical igneous rocks, which are unstratified and massive. Sedimentary rocks can be classified as follows: (1) mechanical sediments of terrigenous origin; (2) mechanical sediments of organic origin; (3) chemical precipitates.

Mechanical Sediments of Terrigenous Origin.—Included here are all those substances which have been washed from land surfaces and deposited in the seas or other bodies of water, as above explained. The principal varieties are: (1) Conglomerates, otherwise known as pudding-stones. These are solidified gravels, in which coherence is due to some cementing principle (lime, iron, or silica) to pressure, or to both. Where the fragments of rock are angular, as though freshly broken, the rock is called breccia. Breccias are not all of water origin. They are occasionally terrestrial. In either case they have not been transported far from the parent ledge, as their sharp corners indicate. (2) Sandstones, consolidated sand-beds. Where the cement is calcareous they form calcareous sandstones. They are also called silicious or ferruginous, according to the character of the cement. Argillaceous sandstones contain an admixture of clay. Coarse sandstones containing grains of undecomposed feldspar are called arkose. (3) Shales, solidified clays or muds. They may contain some sand, and are then said to be arenaceous; or they may contain lime in the form of shell-fragments or impalpable limy material, and are then called marls. Marls are thus in part of organic origin.

Mechanical sediments of the character above described accumulate alike in seas and lakes. Those deposits made in the sea are called marine; those made in lakes, lacustrine.

Mechanical Sediments of Organic Origin.—These may be the result of the accumulation of

either animal or plant remains. The accumulation of hard parts of animals, such as the shells of mollusks and other mollusk-like forms, the framework of coral polyps and echinoderms, and the microscopic skeletons of some of the protozoans, form the bulk of limestone and other chemically similar deposits. Coquina, the Florida limestone, is composed of a mass of mollusk-shells; crinoidal limestones of the fragmentary skeletons of those marine forms so abundant during Palæozoic time. Coral limestones are formed by the building up of coral reefs and by the accumulation of fragmentary coral materials and finely divided coral muds, which may be distributed widely over the floor of the ocean by currents, forming compact calcareous rocks. Calcareous accumulations of this particular sort are considered to have been changed to dolomites by the action of the salts of magnesium in the sea-water, on carbonate of lime, replacing part of the calcium by magnesium and forming $(Ca,Mg)CO_3$ out of $CaCO_3$. This imperfectly understood process, by which limestones are changed to dolomites, is called dolomitization. Dolomites and limestones grade into each other and together are among the most common and important rocks of the lithosphere.

Chalk is an accumulation of minute calcareous shells secreted by the lowest forms of animal life, the protozoans, certain forms of which abound in the surface waters of the oceans. When they die their shells rain down through the water and accumulate on the floor of the high seas, forming oozes. The chalks are considered to have originated in a similar manner during past geologic time.

Chief among the accumulations of plant remains is peat, an accumulation of vegetable materials in swamps or moist places. It is a dark brown or blackish residuum left by the partial decomposition of mosses and other vegetable accumulations, not always made strictly in the water, but always in moist places, and usually in the waters of swamps. Similar vegetable accumulations on a most extensive scale have been formed during past geologic time, and now constitute beds of lignite and bituminous and anthracite coal. Diatomaceous or infusorial earth is a silt-like deposit consisting mostly of the microscopic silicious shells of that low order of plants called the *Diatomaceæ*.

Chemical Precipitates.—Briefly enumerated, these are salt and gypsum, found in alternating beds, and considered to have formed by the evaporation of salt lakes, or by the isolation and evaporation of bodies of sea-water. Calcareous sinter or tufa consists of carbonate of lime, which has been brought up in solution in the waters of hot springs and deposited as porous or cellular material about their vents. It is also deposited from solution in the waters of rivers and lakes, and occasionally forms deposits of considerable extent. Travertine is a more compact form of the same material, as is also Mexican onyx.

Eolian Rocks.—In regions unprotected by vegetation, as along sea-beaches, the shores of lakes, or in the region of deserts, the finer sands are picked up by winds and drifted like snow into oval or rounded hillocks called dunes. Often these drifting sands are a menace to agriculture, since they gradually encroach upon and bury under them, the arable land. Sands thus deposited by winds are only rudely stratified. In

ROCKS

the same manner fine impalpable dust is transported long distances, and gradually accumulates to form loess. The loess deposits of China are locally over 1,000 feet thick. Similar accumulations occur in the United States, Europe, and in Argentina. The Mississippi Valley loesses are believed to have been laid down in water under unusual conditions. True loesses are unstratified, and have a characteristic vertical cleavage.

Glacial Deposits.—The great continental glaciers that, geologically speaking, existed only yesterday over a large portion of the continents of the northern hemisphere, left behind them vast amounts of characteristic material, which was in part deposited by the glaciers directly and in part by the waters resulting from the melting of the ice. These latter deposits are therefore partly of aqueous origin, and are called fluvio-glacial. Glacial drift is the general term applied to all the materials resulting from glacial action direct or indirect. Glacial till is the dense bluish clay, with numerous imbedded boulders, characteristically striated, formed underneath the glaciers (sub-glacial material). This till-sheet (or ground-moraine) is found over a large portion of the area covered originally by the glaciers, and varies in thickness from zero to hundreds of feet. Other sub-glacial accumulations are called drumlins, till-billows, till-tumuli, crag-and-tail, etc. Materials dumped down at the margins of the glaciers in confused heaps are termed moraines (terminal, lateral, or medial). Streams flowing within or underneath the glaciers deposited along their courses material (sand, gravel, clay), which remained behind after the melting of the glaciers in elongated ridges called eskers or osars. Where these streams issued at the margin of the ice-sheets they left irregular mounds called kames. Streams flowing on the surface of the ice would likewise accumulate materials of the same sort, which would remain after the melting of the ice as long serpentine ridges known as super-glacial kames or eskers. These floods of water escaping from the glaciers carried the gravels, sands, and silts far beyond the margins of the glaciers, and deposited them as deltas, fans, overwash aprons, and valley trains.

Metamorphic Rocks.—The processes of metamorphism have already been described as the result of the action of heat, pressure, and moisture upon deeply buried sediments. There are two kinds of metamorphism: contact, and regional. Contact metamorphism is produced by the heat of intruded masses of igneous material upon the surrounding rocks. The contact zone or area about the intrusion affected by its heat is usually narrow, but it may extend for rods or even miles from the intruded mass. The changes resulting from contact metamorphism are not so important in the production of altered rock-masses as they are in the formation of new minerals, so that they are of more especial importance to the mineralogist.

Regional metamorphism, on the other hand, as the name implies, has been exerted over wide areas, and has produced the most profound and far-reaching effects. By it the rocks over many thousands of square miles have been completely altered from their original condition. Sediments consisting originally of loose materials

have been reduced to a fluid, semi-fluid, or pasty condition by the combined action of heat, which has penetrated into them from the interior of the earth, moisture, which everywhere saturates the lithosphere to great depths, and pressure, which at the depth of only a few thousand feet is well-nigh inconceivable. The fluidity of rocks thus produced is more or less akin to the fluidity of true igneous magmas, but with an essential difference. In the case of metamorphism the fluidity is due to solution of the mineral substances in water (superheated perhaps); while in the case of magmas it is due to the solution of one mineral substance in another, water being present as an accessory constituent. To this, heat and pressure must be added, also the pressure, with consequent heat, which comes from the lateral or tangential thrusting-in of the crust of the earth upon itself, due to the slow shrinking of the earth under gravity. As a result of this pressure the older deeper-seated rocks (as well as some of the more recent ones) have been intensely folded, plicated, and sheared, which folding and shearing alone would be sufficient to alter them completely. Metamorphic rocks have other structures developed in them, such as crushing; jointing (series of more or less parallel cracks intersecting each other at nearly right angles and breaking the rock-masses into blocks with rudely parallel sides); faults (produced by the slipping of the walls of rock on either side of a fissure over each other); slaty cleavage (produced by great pressure exerted at right angles to the cleavage surfaces); fissility (the visible separation of rocks into thin laminæ, also due to pressure, and attended by slight movement of the laminæ on each other); schistosity or foliation (the property of splitting into plates with rough undulating surfaces, due to the parallel orientation of the mineral crystals). This may be cleavage, fissility, or both.

These structures are not confined to the metamorphic rocks, but are common to the sedimentary and igneous. They are more frequent, however, in the older rocks. The same processes of metamorphism, so potent in the transformation of true sediments, are just as efficacious in producing changes in the igneous rocks themselves, by virtue of which processes the igneous rocks frequently become so profoundly altered as to be utterly unrecognizable.

The metamorphic rocks as a class are holocrystalline, and in this respect resemble the igneous rocks of plutonic origin. Their chief varieties will now be considered.

Gneisses.—Disintegrated or residual granite consists of disaggregated particles of quartz and more or less thoroughly kaolinized feldspar, with considerable true clayey residue resulting from the complete decomposition of some of the feldspar, all somewhat tinged by the oxide of iron. It is easy to see how a similar assemblage of materials could be brought together upon a sea-beach. By a subsidence of the area and a continued deposition of other sedimentary materials above them, that first assemblage of sand and clay might become so deeply buried as to come within the sphere of metamorphic action. If reduced to a more or less fluid condition by heat, pressure, and moisture, and subsequently allowed again to solidify, it would crystallize out

as quartz, feldspar, and mica. In being so altered it would not necessarily have its original bedding-planes obliterated, and the rock would have the mineralogical composition of granite, but obviously would be of sedimentary origin. A metamorphic rock of such a character would be called gneiss. In the same manner a variety of mixtures might be altered with the same result. Conglomerates are known thus to pass by imperceptible gradations over into gneisses. An arkose might alter to gneiss. If the material originally contained much iron, then hornblende, or some other ferromagnesian mineral, such as biotite or augite, would result, and the rock would accordingly be called hornblende-, biotite- or augite-gneiss. Garnets might result from the metamorphism, and the gneiss would then be called garnetiferous. Fibrolite or cordierite might form, and the rock would be named accordingly.

Igneous rocks such as granites, syenites, or gabbros, by processes of metamorphism, may be altered into gneissic rocks. The chief metamorphic factor in the changing of igneous rocks to gneisses is, however, intense pressure, as a result of which even these most resistant of all rock-masses are made to flow like some viscous substance. This flowing, which is accompanied by more or less shearing, results in producing schistosity or foliation, which is accompanied by a distinct banding exactly simulating original bedding, so that the rocks lose their original massive form and come to resemble altered sediments. A granite in which this secondary banding or foliation had been produced would be called a granite-gneiss; a gabbro similarly altered would be termed a gabbro-gneiss, etc. In general we can say that a gneiss is any holocrystalline, foliated, metamorphic rock, of either sedimentary or igneous origin, which has the mineralogical composition of some one of the plutonic igneous rocks. It is frequently impossible to determine whether certain rocks are true sediments or altered igneous rocks.

Schists.—The term schist is applied to any holocrystalline metamorphic rock which, on account of the parallel arrangement of its crystal particles, tends to split more or less perfectly in parallel planes (schistosity or foliation). Clay upon metamorphosis yields mica. If little iron be present it furnishes muscovite (or sericite, its hydrated form), but if much iron be present it produces biotite. From this it follows that clay-beds on metamorphosis furnish mica of some sort or other, and as the rocks are always distinctly foliated, owing to the invariable parallel orientation of the mica-scales, they are called muscovite (or sericite) or biotite schists. Some quartz and feldspar may be present, but if subordinate they are still reckoned among the schists. Rocks of this character mark the transition of the schists into the gneisses. Staurolite, chialtolite, kyanite, stillmanite, albite, and garnet are of frequent occurrence among the mica-schists particularly, and in such cases the schists are designated staurolite or albite mica-schist, etc. Mica-schists range in granularity from coarse- to micro-crystalline, the micro-crystalline varieties being called slates; the finely crystalline intermediate forms, phyllites.

Quartz-schists are essentially quartz-rocks, which contained originally some disseminated

clay that altered to mica, as a result of the presence of which the rock has a schistosity. Many basic igneous rocks of the diabase order on metamorphosis change to hornblende-rocks. Where they are foliated they are called hornblende-schists. If more or less massive they are termed amphibolites. The diabasites are very apt, however, to alter to chlorite schists, especially if the original augite was of the aluminous variety, and they may alter to biotite schists.

Other Metamorphic Varieties.—Pure quartz-sand metamorphoses to a holocrystalline rock called quartzite. Limestone metamorphoses to a more or less coarsely crystalline rock consisting of grains of calcite. If fine, even-granular, it is known as marble. If coarse-granular, it is called crystalline limestone or simply limestone. But the term marble is used to embrace all crystalline calcite rocks that are susceptible of a polish. Serpentine results from the metamorphosis of basic igneous rocks consisting largely of the non-aluminous varieties of hornblende or pyroxene and olivine. The peridotites are especially susceptible to this change. Anthracite coal results from the metamorphosis of bituminous coal, which in turn is derived from peat or lignite. In certain extreme cases of metamorphism anthracite becomes altered to a graphitic material.

FREDERICK B. PECK, PH.D.,
Professor of Geology and Mineralogy in Lafayette College, Easton, Pa.

Rockstro, William Smith, English musical composer: b. North Cheam, Surrey, 5 Jan. 1823; d. London 2 July 1895. His first composition was a song 'Soon shall chilling fear assail thee.' In 1844 he studied under Sterndale Bennett and by his advice spent a year at the Leipsic Conservatorium. He was also one of seven specially selected pupils of Mendelssohn, and laid the foundation of his great theoretical knowledge under Hauptman. He edited a series of operas in vocal score, as 'The Standard Lyric Drama.' Rockstro ultimately concentrated his attention on musical archæology, and his deep and practical knowledge of the ancient methods was fully shown in the 'Dictionary of Music and Musicians,' to which he contributed many articles. He also published a valuable 'General History of Music.'

Rockville, rök'vil, Conn., city in Tolland County; on the Hockanum River, and on the New York, N. H. & H. railroad; about 16 miles east-northeast of Hartford. Electric lines extend to Hartford, Ellington, and other nearby places. Nearby is Shenipsit Lake, of which Hockanum River is the outlet. The river has here a series of falls, making in all a descent of 280 feet, and furnishing Rockville with extensive water-power. The city was settled in 1716 by a colony from East Windsor, and was a part of the town of Vernon until 1889 when it was chartered as a city. There are about 20 manufacturing establishments of importance, chief of which are envelope factories, silk and woolen mills, gingham and satinet factories. The principal public buildings are the schools, churches, and the library. The latter cost over \$100,000. There are eight churches, a high school, public and parish schools, two private schools, and a public library. The government is administered by a board of alder-

ROCKWELL — ROCKY MOUNTAIN SUBREGION

men, four members, and a council of eight members. Pop. (1890) 7,772; (1900) 7,287.

Rock'well, Alphonso David, American physician: b. New Canaan, Conn., 18 May 1840. He was graduated at Kenyon College, and the College of Physicians and Surgeons in New York. He is a specialist in electro-therapeutics and neurology, having held a professorship in the former subject in the Post-Graduate School of Medicine and also in the New York State Women's Hospital. He was one of the three commissioners appointed to give advice on the establishment of the new method of execution by electricity adopted by the State of New York. He is the author of 'Relation of Electricity to Medicine and Surgery'; 'Nervous Exhaustion' (1901); and, with G. M. Beard, 'Treatise on the Medical and Surgical Uses of Electricity.'

Rockwood, Tenn., town in Roane County; on the Cincinnati, N. O. & T., the Rockwood & T. R., and the Tennessee Central R.R.'s; about 40 miles west-southwest of Knoxville, and 88 miles north by east of Chattanooga. It is in a coal region in which there are extensive deposits of iron ore. The chief industrial establishments are blast furnaces, foundries, machine shops, and coal yards. The trade is chiefly in coal and in iron products. Pop. (1890) 2,305; (1900) 2,899.

Rocky Gap, Engagement at. On 5 Aug. 1863 Gen. W. W. Averell, with a brigade of cavalry and mounted infantry and a 6-gun battery, left Winchester, Va., for a raid into West Virginia, which was to be continued to Lewisburg and the Virginia & Tennessee railroad. He moved by way of Wardensville to Moorefield, and to the upper valley of the south branch of the Potomac, and then to Huntersville, driving back Col. W. L. Jackson's cavalry. As he approached White Sulphur Springs, on the morning of the 26th, he encountered Col. Geo. S. Patton, who, with four small organizations of infantry, two battalions of cavalry, and a battery, in all about 1,900 men and four guns, had been ordered to intercept him, and had taken position at Rocky Gap, the junction of the Huntersville road with the Lewisburg and Kanawha turnpike. Patton was strongly posted, and Averell opened upon him with artillery and disabled two of his guns; but successive charges by Averell's dismounted force, with efforts to flank him, continued during the entire day, failed to dislodge him, and at night, after nine hours' fighting, the contending forces occupied the same positions as in the morning. Averell intended to renew the fight next morning, but, learning that Patton had received reinforcements from Lewisburg, made arrangements to withdraw. At 10 A.M. Patton attacked his left and half an hour later Averell ordered a retreat, which was conducted in good order on the road to Warm Springs, and thence by way of Huntersville to Beverly, which was reached on 31 August. The Union loss was 25 killed, 125 wounded, and 67 missing, a total of 217; the Confederate loss was 20 killed, 129 wounded, and 13 missing, a total of 162.

E. A. CARMAN.

Rocky Mountain Goat, a goat-antelope (*Oreamnos montanus*), related to the chamois and serow, which inhabit the heights of the Rocky Mountains and Cascade Ranges between

the forests and the snow line, from the 44th to the 65th degree of latitude. It is about the size of a goat, but is stouter, handsomer and has stronger legs. It is completely covered with long, thick, white hair, which forms an erect mane along the middle of the back from between the horns to the root of the tail; the shoulders are rather humped, and the head is habitually carried low. Both sexes have slender, smooth, black horns, curving backward, about eight inches long and sharp-pointed. Its pure white coat is a capital protection against observation in the midst of the alpine snow, and is unique, as no other white ruminant is known. Dwelling in such solitudes they have little to fear from natural enemies, and fall an easy prey to the human hunter who has the hardihood to pursue them upon the rough mountain peaks, and skill enough to get near to them unobserved. "Their food," says Wister, "seems to be chiefly the short almost lichen-like moss that grows on the faces and at the base of the rocks, and between them in the crevices. . . . I am inclined to believe that the goat keeps consistently to the hills, whatever the season may be, and in this differs from the mountain sheep, as he differs in appearance, temperament and in all characteristics, except the predilection for the inclined plane; and in this habit he is more vertical than the sheep." A variety from the Copper River region, in Alaska, is marked by greater divergence of horns and some other structural characteristics, and has been called *O. kennedyi*. The flesh of the mountain goat is not very good, but its hair was utilized in weaving by the Indians of British Columbia and the coast northward; and its tanned hide has a value in market as a rug. Consult Stone and Crane, 'American Animals' (1902), and authorities on travel and sport in the Northwest.

Rocky Mountain Sheep. See BIGHORN; SHEEP, MOUNTAIN.

Rocky Mountain Subregion, a rather indefinite zoogeographical region embracing the elevated area occupied by the Rocky Mountains, which zoologically presents certain peculiarities very noticeable to a traveler from either the eastern lowlands or the Pacific coast. The resemblance in the fauna is, indeed, rather to the East than to the West, as the Rockies do not form a zoological "divide" to anything like the extent which the Sierra Nevada does, nor even as completely as does the line of deserts which occupy the great depression of Nevada and Idaho between the Wahsatch range and the Sierra Nevada.

A large number of species of animals and plants extend from the Mississippi Valley to and throughout the Rocky Mountains, in forms which are identical from one side of their wide range to the other, or which shade indistinguishably from one varietal extreme in the East to another in the West. On the other hand the plants and animals common to both California and Colorado are comparatively few. The dry and foodless deserts of the Utah basin form a more potent barrier than the snows and altitude of either Sierras or Rockies. Thus the buffalo formerly wandered throughout the whole network of interior valleys, and there is a special variety which seem never to have left the park-

ROCKY MOUNTAIN SUBREGION

pastures and scantily timbered defiles; yet Bear River, Utah, on the border of the alkali basin, is the farthest west they ever got south of northern Idaho. The elk, grizzly and bighorn, the mountain goat, white ptarmigan and certain other examples of animals, are common to both the Sierra Nevada and the Rocky Mountain systems; but in all these cases they are species whose range extends far north where both lines of elevation converge in British Columbia. Yet the true "blacktail," or Columbian deer, is never shot east of the Cascades, nor does the Virginian, or willow deer, common enough in the Rockies, wander over to the Cascades or Sierras of Oregon and California.

To a more limited extent the Great Plains on the east serve as a barrier between the commingling of plants and animals indigenous to the mountains on the one hand and the Mississippi Valley on the other. And that this, as far as it goes, is a real barrier, is shown by the fact that many common weeds and trees, which flourish well in Colorado now, had never reached there until carried, either intentionally or accidentally by man; that is, the place was suitable enough to them, but they had never been able to reach it.

The Rockies, then, form a zoogeographical district, which embraces practically the whole system of complicated chains from New Mexico to the borders of Alaska, and there is a curious homogeneity throughout, a long list of insects, mollusks and animals of the lower classes, as well as of trees and herbs, occurring from the Rio Grande to the headwaters of the Saskatchewan, disregarding the difference in latitude, which in flat regions is the most powerful factor governing the distribution of animal and plant life.

This is not exceptionally the case in the Rocky Mountains alone, though here it is conspicuous and well-marked. It is true of the Ural-Carpathian system, of the Scandinavian ranges, of the Andes, of the great East-African system, of which Mounts Kilimanjaro, Kenia, and Gordon-Bennett are peaks; nor is it difficult of explanation. A great mountain-province is really a series of sub-provinces concentrically arranged, or, to put it in another way, heaped on top of one another, for the largest bound, embracing the whole extent of the mountains and their foothills, contains several more or less restricted areas, determined by altitude, just as a vast lowland province, such as the whole eastern half of the continent, contains several well-defined subdivisions according to zones of climate, succeeding one another from north to south. The cause of the natural division of these sub-provinces is precisely the same in both cases, for, whereas in the Mississippi Valley the cooler or warmer average temperature required by each animal or plant for its best development is obtained by moving to the north or to the south, so in a mountainous region too much cold or too much heat can be avoided by moving upward or downward, and climate varies with altitude instead of latitude.

Hence, naturalists who have studied the mountains are able to mark out successive sub-provinces, according to altitude, within the upper and lower borders of which certain forms of life are restricted, appearing neither below, or

above, a limited number of thousand feet, except as occasional wanderers. Botanists have long recognized this.

Of course the number of varieties steadily decreases as one ascends just as on approaching the poles, because the means of supporting life diminish in proportion as a moderate climate and abundant vegetation are left behind. The hardy grizzly can stray to the utmost heights, as he is fond of doing, for his strength, power of locomotion and fasting abilities make it possible; but even he cannot remain there long, since food is very scarce beyond the timber. The eagle and greater hawks may soar above the naked icy crest of the loftiest summits, or perch upon the pinnacles, but they seek their prey and build their nests for the most part at far lower levels. A few small birds, like certain semi-arctic warblers and sparrows (especially the gay *Leucosticte* finches) and one large one (the well-known ptarmigan), the little-chief hare or "cony," which stores in its rocky tunnels a winter larder of roots and stems gathered at the edge of the snow during the brief summer, and a small variety of beetles and other insects more or less subterranean in habits, alone brave the storms and famine involved in continuous residence upon the higher summits.

Next below lies the zone of hardy plants and of a longer list of animals, such as the Canada jay, dusky grouse, several hawks and owls, the kinglets, water-ouzel, snow-birds and *Zonotrichia* finches, the bighorn sheep, and a large variety of insects and snails. Below that, down among the pines and abundant shrubbery of the lower slopes and the foothills, one finds in summer the full measure of Rocky Mountain life.

An examination of these facts discloses that all the inhabitants of the lofty plateaus and the rocky peaks are arctic animals, and some of them, like the ptarmigan, turn white in winter in true arctic fashion. These creatures, finding the same conditions at those great heights to which they are accustomed at lower levels inside the polar circle, can live and flourish on an arctic island, as it were, in the midst of the temperate zone; the long narrow snow peaks of the great range forming a tongue of polar climate stretching half way to the equator. It has thus been possible for the beautiful white goat, whose proper home is in British Columbia, to stray south along the crest of the Sierra Nevada and Rockies as far as these high mountains run, but he must keep upon the very crest, whereas in Alaska he comes down to the shore. The insects and minute life of the peaks of Colorado belong to the same class with (are often identically the same species as) those collected by polar exploring expeditions. The same is true of plants. "Red snow" and arctic lichens may be gathered on Pike's Peak.

It is natural, then, that two different migratory movements should be observable in the Rocky Mountains; one the regular seasonal movement southward in the fall and back in the spring, affecting chiefly those birds that live at the base of the range, or near it; and another movement, which is regularly made by many animals, upward to the cooler and fresher pastures in the summer, and back to the less

ROCKY MOUNTAIN TROUT—ROCKY MOUNTAINS

snowy and more sheltered dells near the base of the mountains as winter approaches. This vertical migration is very well understood in the case of the game, and the paths which the animals follow are often distinct.

The foregoing facts lead to an interesting generalization. While the southern peaks might be colonized by such stragglers from the north as the goat and the ptarmigan, whose legs or wings enable them to travel back and forth, there is a much longer list of small and practically stationary animals never found in the intervening valleys and totally unable to cross from one peak to another. Hence we must conclude that each lofty mountain top is a habitat by itself, entirely cut off from neighboring peaks where duplicates of its fauna and flora may be collected. On the tops of Mount Washington, in the White Mountains, and Mount Marcy, in the Adirondacks, are insects and cryptogamous plants which do not occur anywhere between these isolated fragments of polar climate and the arctic circle, where the same butterflies, spiders and lichens are widespread and indigenous.

How shall this isolation of strictly circumscribed faunas upon mountain peaks be explained? Clearly it dates back to a time when communication between them existed. The ice-cap which, during the last Glacial Epoch, gradually overspread a large part of the north temperate zone and in the Rocky Mountain region covered the whole extent of their highlands with a thick mantle of snow and filled every cañon with local glaciers, of course crowded southward all the surviving life which had been wont, during the warm Tertiary time, preceding this cold period, to dwell far toward the north.

But when the epoch was on the wane, and the ice-front began to retreat, the relieved earth was again clothed with vegetation and re-tenanted by cold-loving animal life, which advanced northward closely in the rear of the retreating glacier. At a greater distance followed the more delicate animals and plants, gradually spreading northward as the moderating climate permitted, until they had established themselves in isothermal zones as we now find them. But as a subsiding flood will leave, stranded upon the top of the first points to appear above the surface, the driftwood and wreck of the deluge, so, as the warmth of southerly regions at a low elevation has increased, certain colonies of the advance guard of the army of animals and plants have found themselves stranded upon frigid mountain tops— islands of arctic climate— isolated from their fellows by warm valleys and plains in which their kindred speedily disappeared, overcome in the battle for life by the greater increase of lowland species to whom the circumstances were more favorable; but here on the high cold peaks they have been able to keep a stronghold, each in its own in a limited area, though surrounded by utterly fatal conditions.

Consult authorities cited under ZOOGEOGRAPHY, especially the writings of C. Hart Merriam.

Rocky Mountain Trout. See DOLLY VARDEN TROUT.

Rocky Mountains, or Cordilleran System, the system of mountains which constitute the major axis of elevated lands of North America,

in the western part, extending from the Arctic Ocean on the north to South America on the south, and parallel with the Pacific coast. This great system of mountains is continued along the Pacific coast in South America under the name Andes Mountains (q.v.). Between the Rocky Mountains and the Andes is a pass in Panama not many feet above sea-level. The width of the system varies; the greatest breadth is in the United States, between lat. 38° and 42° N., where it is about 1,000 miles. The width diminishes north and south, increasing again in Mexico and diminishing only with the width of the continent. The highest point of the system is in Alaska, but the highest land mass is in the United States between 35° and 42° and on the eastern side of the system.

Ranges.—The ranges on the western boundary, and near the Pacific coast are the Cascade and Sierra Nevada in the United States, the Sierra Madre in Mexico and Central America. West of the Sierra Nevada, in California, is the Coast Range. The eastern chains in the United States, called the Rocky Mountain Range, extend north and northwest in the United States, approach nearer the Pacific in Canada, continuing into Alaska to the Arctic Ocean. On the east of the Rocky Mountain Range is the great central plain of the United States and Canada. Rising abruptly from this plain are many isolated cone-shaped peaks which gradually merge into ranges, forming an almost continuous eastern barrier, composed of short ranges, chief of which are Sangre de Cristo, Colorado or Front Range, Medicine Bow, Big Horn, and Laramie. Farther east, in South Dakota and Wyoming, are the Black Hills, a mountain mass detached from the main ranges. In Wyoming the ranges divide, some extending southeast, others southwest, and several short ranges having an almost east and west trend. Some of the well known interior ranges are Wahsatch, extending through Utah, and forming the eastern wall of the Great Basin, Wind River, Salmon River, San Miguel, and Beaver River. Bitter Root Mountains form the divide between the headwaters of the Colorado and the Missouri Rivers. In Nevada the short ranges are generally north and south, in the central and eastern part there are a large number of short, almost parallel chains. Other noted ranges are the Cœur d'Alene, the Lapwai, and the Blue. The ranges south of the divide in Wyoming have a greater altitude than those north; but some of the southern ranges after leaving Colorado on the south and east, end abruptly, and others slope gradually to the low desert plains. The greatest development is in Colorado.

Peaks.—In Colorado there are about forty peaks which are over 14,000 feet in height. Among them are Grays Peak, 14,341 feet in height; Longs Peak, 14,271 feet; Pikes Peak, 14,134 feet. In the Sawatch Range, in Colorado, are Mount Harvard, 14,375 feet, and Mount of the Holy Cross, 14,176 feet. In the mesa region in western Colorado is Uncompahgre Peak, 14,408 feet; and in Sangre de Cristo Range is Blanca Peak, 14,463 feet. Other famous peaks, outside of Colorado, are, in Wyoming, Fremont's Peak, 13,700 feet, in the Wind River Mountains; Mount Hayden, 13,691 feet, in the Sawatch Range. In the Colorado, or Front Range, there are four peaks over 14,000 feet;

ROCKY MOUNTAINS

in Sawatch Range, 10 peaks; in the Sangre de Cristo, three; in the San Juan, four; in the Sierra Nevada, four. In Park Range (not group) and in the Pikes Peak Group, there is one in each. The highest peaks belong to the Cascade Range. Mount McKinley in Alaska, is over 20,000 feet above sea level; Mount Logan is 19,500 feet; Mount Saint Elias, 18,101; Mount Rainier, 14,444. Many of the peaks of this vast system, especially in the Cascade Range, are extinct volcanoes. In Mexico and Central America there are a number of active volcanoes. Orizaba, 18,300 feet in height; Popocatepetl, 17,887; and Ixtaccihuatl, 17,343, are among the highest active volcanoes.

Plateaus.—The great plateau region included in the Rocky Mountain system is in southern Wyoming, eastern Utah, eastern Arizona, western New Mexico, and western Colorado. The lands in Colorado and New Mexico east of the mountain ranges belong to the Great Plain. The Plateau region is bounded on the north by Sweetwater and Wind River Mountains. The general elevation of the whole plateau is about 7,000 feet above sea-level, but in Colorado it has an elevation of 10,000 feet. The continental divide crosses this plateau; and within its limits are the waters of the three great river systems of the United States, the Mississippi, the Colorado, and the Columbia. The southern part of the plateau has in places an abrupt ending, a steep, almost perpendicular escarpment. The ranges crossing, divide the plateau region into sections to which have been given the names Kaibab, Kaiparowits, Aquarius, Colorado, Markagunt, Paunsagunt, Paria, Shiwiits, Tavaputs, Uinkaret, and others not so well defined as those named. On these broad plateaus are groups of mountains, buttes, and isolated ranges and peaks. There are seven peaks over 13,000 feet above sea-level; five over 12,000 feet and less than 13,000 feet; and 20 over 10,000 feet and less than 12,000 feet.

Parks.—The Parks of Colorado are high mountain valleys, known as North, Middle, South, and San Luis, with an elevation of from 6,000 to 10,000 feet, surrounded by ranges of mountains from 3,000 to 4,000 feet higher. The west border of the San Luis Park is formed by San Juan Range, with its high peaks, more than 100 of them over 13,000 feet, bordering it like giant watch towers. The Uintah Range is west of North Park. The Parks, or enclosed mountain valleys in Idaho and Wyoming, are not so high as the Parks of Colorado. The most famous park in the whole Rocky Mountain System is Yellowstone Park (q.v.) in Wyoming, now a Government Reservation. The ranges on the boundaries of the Parks and rising from the Park Valleys, are grouped together as the Park Ranges or Park System. The mountains so designated are bounded on the north by the Laramie Plains, and on the east by the Great Plains. The southern and western boundaries are indefinite. Other noted parks are Monumental Park and the Garden of the Gods, near Colorado Springs. The 500 acres are covered with an extraordinary rock formation, like giant spires and pillars, and some like vast cathedrals. The Yosemite Valley (q.v.) is often classed with the Parks.

Desert Region.—Within the area called by this name are vast arid regions, bare bleak

mountains, and localities of almost barren lands, some of which might be made fertile by irrigation, and some fertile valleys. It includes the southern parts of Idaho and Oregon, the western parts of Utah and Nevada, the southeastern part of California, the southwestern part of New Mexico, the southern part of Arizona, and the north central part of Mexico. The Sierra Nevada and Cascade ranges are on the western boundary; and the plateau drained by the Colorado River is on the eastern boundary. The greater part of this region is known as the Great Basin (q.v.) which has no apparent outlets to the ocean. The ranges, as in Nevada, are simple and narrow and separated by broad, level desert valleys.

Passes.—Several depressions in the ranges are called Passes, and some have been used for routes for railroads. A famous pass is the Lewis and Clark's, in latitude 47°. Through this pass the Northern Pacific railroad has been built, and at Mullan's Pass it goes through a tunnel 3,850 feet long. The Truckee Pass, 6,000 feet above sea-level; the South Pass of the Wind River Range, Evan's Pass in the Front Range, which is crossed by the Union Pacific railroad, are all well known. In Canada the pass between Mount Hooker and Mount Brown, Athabasca Portage, is 7,300 feet above the sea. In the California mountains there are a number of passes. Where the rivers have cut their channels through the mountains, passes have been formed.

Lakes, Rivers, and Glaciers.—The greatest rainfall is on the western slope, where the moisture brought by the winds from the Pacific Ocean falls. In the valleys and on the plateaus, especially where the waters fall down the escarpments, the rivers run through deep cañons, the almost perpendicular sides of which are thousands of feet above the river beds. The rivers of the plateaus have their sources in the Park and Wind River Mountains, and in the Wahsatch Range. They have carved out deep gorges, which divide the region into a series of distinct plateaus. Some of the famous cañons of this region are the Grand of the Colorado, the Kanab, and the Marble. The principal rivers within this region are the Green, Colorado, Sevier, Paria, Uintah, and White. The rivers whose head-waters are in the Sierra Nevada Range, flow to the Pacific, except a few, which flow east and are lost in the sands. The Sacramento and the San Joaquin are in the valley between the Sierra Nevada and the Coast Range. The one river comes from the north, the other from the south, almost parallel with the ranges until they unite, when they burst through the mountains and discharge their united waters into the Pacific Ocean. The Columbia is one of the great rivers of this region. Rising on the east side of the Cascade Mountains it flows south for some distance until finally it plunges through the mountains in a series of magnificent cascades, whence the name of the range. The Front Range in northern Montana bears upon its crest for many miles the continental divide which separates the headwaters of the Missouri and the Columbia rivers. The Bitter Root Range separates the Missouri from the Salmon. The greatest water systems of North America have head-waters in the Rocky Mountains. The Colorado toward

ROCKY MOUNTAINS

the south, the Yukon on the north, and the Columbia are the largest streams that flow toward the Pacific; the Mississippi, the Great Lakes and the Saint Lawrence, and the streams that flow into the Hudson Bay all reach the Atlantic Ocean; and the Mackenzie and its tributaries flow into the Arctic. The Rocky Mountains have many small lakes, formed by springs, and depressions which serve as basins. In the Great Basin are several bodies of salt water, the largest of which is Salt Lake (q.v.). The only crater lake in the United States is Crater Lake in the National Park. The glaciers of the Rocky Mountains are numerous. In Alaska are the largest and greatest numbers among which are Muir, and Malaspina. Mount Rainier (q.v.) has over 30 glaciers, extending over a space of 100 square miles, and some of the ice walls reach a depth of 1,000 feet. The Puyallup and Mowich rivers drain five of the largest glacier rivers of Mount Rainier. A notable feature of these rivers is what is known as glacial tides, which are quite marked in summer time. Between midday and a few hours before sunset, there is an increase in the flow of water at the head of each river; about two feet in the narrowest part of the rivers. The plan is already under way to construct a dam in Puyallup River at a point 1,900 feet above tide-water, and 35 miles from Tacoma, from which the water will be carried by a power canal to a point $10\frac{1}{2}$ miles below, to be precipitated into a large power house in the cañon. The power generated will be transmitted to Tacoma, Seattle, and other places. The vastness of Mount Rainier may be conceived when it is known that the surface, including the hill country at its base, has an area of 3,000 square miles, and scientists who have examined the mountain say it has the greatest ice covering of any elevation on the Western Hemisphere. In other parts of the Rocky Mountains are found vast glaciers, and many of the peaks are ever whitecapped with snow.

Geology.—The name "Rocky" Mountains is most appropriate to this vast elevation, for in the mountain range, on the plateaus and in the high valley are numberless naked rocks, such as are found nowhere else in America. The aridity of a large portion of the region prevents the growth of vegetation. Across the plateaus are long lines of cliffs, the sides seamed and carved, the debris accumulating at the base. The greater part of this region has been the scene of great volcanic action. The lava, ashes, and scoria are plainly visible. All the mountains of the Desert Ranges are somewhat similar,—a monoclinical ridge of displacement—a fault (q.v.) on one side and a flexure on the other. The strata, generally, dips one way, the escarped edges of the strata form the front or surface of the ridge. Secondary faults and flexures appear in many places. Granites, sandstones, limestones, and schists are found in many of the ranges of this region. The present arrangement of the mountains is not of ancient date, although this region, since Jurassic time, has been above the sea. The eastern ranges are composed of Mesozoic, Palæozoic, and Tertiary sediments, schists, and granites. The present formation is of the Tertiary period; but the irregularities and unconformities show that this section had alternate periods of sea sub-

mergence and of dry lands. The plateaus are separated, by faults and flexures, into blocks. The buttes have horizontal strata and escarped sides. Some of the plateau mountains had their origin in upheaval, and others are of simple anticlinal structure. The Uintah Range, on the north, has an east and west axis, and is the result of upheaval. The Zuni Range, on the south, is of the same type. Like other adjacent regions this shows alternating sea submergence and dry periods, but the plateaus, since the Cretaceous period, have been above water. During the early Tertiary and the late Mesozoic time the basin region was dry, but the plateaus had large lakes and seas. The present "block arrangement" of the plateaus began in the early Tertiary period. The plateaus are composed of the Mesozoic, Palæozoic, and Tertiary sediments. In some of the deep cañons are found granites and crystalline schists. The Sierra Nevada Range bears the marks of recent volcanic action. In the vicinity of Mount Shasta and Lassen Peak are volcanic masses, and on the west slope are vast sheets of lava. The Coast Range has the Appalachian type. The upheaval of this region began in the later Tertiary period; the ranges are made up of oppressed folds of strata, worn down by rains and rivers; the summits are tipped westward. The Cascade Range contains a number of extinct volcanoes. In Canada there are in the region of this range a number of volcanic plateaus. The whole Rocky Mountain area bears the marks of volcanic action. Much is known of the gigantic formations in this region, and the general geological features; but the scientific study of this vast section is in its infancy.

Minerals and Mining.—The Rocky Mountain section is the great treasure region of North America. Almost all the precious and useful minerals are found here in abundance. Gold had been discovered and used by the aborigines, and deserted mines have been found where mining had been carried on in a crude way as early as 1680. Gold exists in nearly all the ranges of the system. Gravel containing coarse gold is found from 20 to 60 and even 100 feet below the surface. Abandoned gold fields were worked over with great profit during the last decade of the 19th century, by using improved methods. There are rich deposits of silver, copper, iron, salt, coal, lead, and in the southwestern part of the United States, petroleum and gas. The placer gold regions in Alaska, and the gold fields of the same territory, have been found thus far (1904) of great extent and value. The value of the fine building stone, the fire-clay, gypsum, all kinds of cement material, are rarely taken into consideration because overshadowed by the value of the gold, silver and copper. The gypsum beds in the northwestern part of Texas and along the foot-hills of the ranges in southern Colorado are of great extent and value. (See separate States and Territories of the United States in the Rocky Mountain region, Canada, and Mexico for more details on MINING and MINERALS.)

Climate.—The west slope of the Rocky Mountains, or all that portion which faces the Pacific Ocean, has a milder climate than the central or eastern part of North America in the same latitude. The warm winds from the Pacific Ocean bring heat and moisture. The

rainfall is copious on the western side of the mountains. Like the mountain regions on all parts of the globe, the temperature lowers with increase of altitude, and the winds which here blow over the cold mountain tops and across the plateau region to the eastern slope carry with them neither heat nor moisture. In the southeastern part of this vast region where the mountains become low ranges or foot-hills, in the United States, west of the ranges that parallel the coast, the climate is hot in summer and mild in winter; in the Great Basin region and on the eastern slope of the mountains, extending out on the Great Plains, the climate is marked by aridity. (See UNITED STATES.)

Flora.—The great aridity of the region east of the western or coast barrier prevents the growth of vegetation. The surface is exposed to erosive action which is specially rapid at such great elevations, and the denudation becomes more complete as the sand and small disintegrated fragments are swept away by the winds, thus giving no opportunity for the accumulation of soil. A large portion of the central and eastern mountain region, and the western part of the Great Plains require irrigation in order to have vegetation; this is so even in the parts where there is abundant fertile soil. The arid portion of the United States, exclusive of Alaska, is about two fifths of the whole area. The redemption of the arid lands is one of the Nation's problems. Less than 10 per cent of the mountain region is forest-clad; but a larger proportion is covered with verdure, including the portions covered with dwarfed herbage, sage brush, and stunted cedars and pines, most of which is useful for fuel but not for building purposes. Crops that mature in a short season and pasturage grasses are found on the foot-hills and valleys, especially along the streams. In some places where a little moisture is carried over the passes, below the snow line, the mountains are covered with the dark evergreen growth of hemlock, spruce, balsam fir, and tall pines; and still further down are interspersed among them the birch, beech, cherry, and various other trees, while along the streams are found groves of cottonwood and willow. Over large districts, however, the forest growth is often exceedingly sparse, and even the grass that covers the plains, and upon which travelers depend for the sustenance for their animals, is parched and disappears in the long droughts to which these regions so remote from the sea are subject. In the sandy regions along the North Fork of the Platte River above Laramie River an extraordinary growth of artemisias and other odoriferous plants is found. They abound in the river bottoms and on the hills, growing to the height of two and three feet, in tough, twisted, wiry clumps. A multitude of flowering plants abound in this region, among which prevail several of helianthus (sunflower), and in the month of September, when they are mostly in bloom, the whole country resembles a vast garden. On the western slope may be found some of the largest trees in the world, many of them over 2,000 years old. The vast forests of the Northwest yield enormous quantities of timber. Not only is there a great variety and amount of plant life, but the vegetation attains a remarkable size. The shrub of the Atlantic region becomes a tall tree on the

Pacific Slope. Like the mountains themselves, the vegetation which covers the western slope is large, massive, dense, and in every way, seems patterned on a gigantic scale. (See CALIFORNIA, *Flora*.)

Fauna.—See UNITED STATES.

History.—The natural history of a region is told by the geology and physical geography. This region is not as old as the Appalachian. The form of the peaks and the irregular surface of the slopes differ. The missionary explorers visited the mountainous sections of Mexico and the southwestern part of the United States in the 17th century, but the 'Relations of the Franciscans' have as yet (1904) been only partially translated. A large part of our knowledge of this section came first from the reports of the Government explorations made by Lewis and Clark, in 1804. Other explorations were made by Harmann, Long, Schoolcraft, Bonneville, Nicollet, and Frémont (q.v.). Since 1844 more than 20 expeditions have been engaged in exploring these wild regions, nearly all of them for the United States Government. Since the bill and appropriations of March 1853, the object of most of them has been the determination of the most practicable route for a railroad from the valley of the Mississippi to the Pacific. The history of the railroads across these mountains is largely a history of this region. The story of the strange, weird people called Cliff Dwellers (q.v.) is a most interesting chapter in the history of the efforts of man to use this region for a home. At present the population of this whole section is small. A large portion has less than two inhabitants to the square mile. About one tenth of the whole Rocky Mountain area in the United States has from two to six inhabitants to the square mile; in some places in California, Oregon, and Washington there are from six to eight; near the cities from 18 to 45, and in the San Francisco section, from 45 to 90.

Geological Survey on 'Placer Gold Mining in Alaska in 1902'; 'Mineral Deposits of Bitter Root Range and Clearwater Mountains of Montana'; 'Ore Deposits of Butte, Montana'; 'Wonderland,' an annual issued by the Northern Pacific Railroad; De Nadailla, 'Prehistoric Americans,' for Cliff Dwellers; Lumbholtz, 'Unknown Mexico' (1903); Day, 'Mineral Resources of the United States'; Dana, 'Geology'; Thwaites, 'A Brief History of Rocky Mountain Exploration' (1904).

Rococo, rō-kō'kō, or **Rocaille**, rō-kāl-ē', in architecture a name given to the very debased style and decoration which succeeded the first revival of Italian architecture. It is ornamental design run mad, without principle or taste. The ornament consists of panels with their moldings broken or curved at the angles, and filled with leafage, shell-work, musical instruments, marks, etc. This style prevailed in Germany and Belgium during the 18th century and in France from the time of Henry IV. to the Revolution.

Rod, rōd, **Edouard**, Swiss author: b. Nyon, Canton Vaud, 31 March 1857. He studied at Lausanne and Berlin, became editor of the 'Revue Contemporaine' at Paris, succeeded Monnier in the chair of comparative literature at Geneva, but subsequently returned to Paris, and

became a collaborator on the 'Correspondant,' the 'Revue des Deux Mondes,' and other periodicals. Among his works of fiction and criticism are: 'La Course à la Mort' (1886); 'Les Trois Cœurs' (1890); 'Le Silence' (1894); 'Scenes de la Vie Suisse' (1896); 'Au Milieu du Chemin' (1900); 'Dante' (1891); 'Stendhal' (1892); and 'Essais sur Goethe' (1898). Rod has visited the United States as lecturer before the Cercle Français de l'Harvard.

Rod, called also a pole, or perch, a measure of length, equivalent to $5\frac{1}{2}$ yards, or $16\frac{1}{2}$ feet. See PERCH; WEIGHTS AND MEASURES.

Rodakowski, rō-dā-kōv'skē, **Henryk**, Polish artist: b. Lemberg 1823. He studied art in Paris under Cogniet and finally settled there. His works consist of historical pieces, genre, and portraits, the latest being the best. He received medals in 1852 and 1855 and was made chevalier of the Legion of Honor in 1861. He painted the portraits of Gen. Dembinski (1852); Artist's Mother (1853); Prince Saieha; Count Raczyński (1859). Among his historical pieces are 'Sigismund Sanctioning Privileges of Nobility' (1872); 'War Without Fight'; 'Galician Peasants at Church' (1857); 'Battle near Choczyn in 1673'; 'King Sobieski Receiving Envoy from Vienna' (1861).

Rodbertus, Johann Karl, yō'hän kārł rōd-bēr'toos, German political economist: b. Griefswald 12 Aug. 1805; d. Jagetzow 6 Dec. 1875. In 1829-32 he was in the Prussian civil service. In 1848 he entered his brief political career, as a member of the Prussian national assembly. Then he was for a fortnight minister of education, and in January, 1849, entered the second chamber from Berlin. Rodbertus was the real founder of scientific socialism in Germany. In contradistinction to Marx (q.v.), above whom he is placed by many modern economists, he was not international nor material in his views, but a nationalist and idealist, and expected social questions to be solved by legal methods. Prof. Wagner has called him "the most distinguished theorist of the purely economic side of scientific socialism." He wrote several works in connection with his propaganda. Consult the lives by Dietzel (1886-7) and Jentsch (1899).

Rodd, Sir James Rennell, English diplomat and poet: b. 9 Nov. 1855. He was educated at Haileybury College and Oxford University, and entered the diplomatic service as attaché in 1883. He was attaché at Berlin in 1884, and at Athens in 1888, 2d secretary to Rome in 1891 and to Paris in 1892, secretary of legation at Cairo 1894-1901, and secretary of the English Embassy at Rome from 1901. In prose he has published 'Frederick: Emperor and Crown Prince'; 'Customs and Lore of Modern Greece'; and in verse 'Poems in Many Lands'; 'Fedra and Other Poems'; 'The Unknown Madonna'; 'The Violet Crown'; 'Ballads of the Fleet.'

Rodenberg, rō'dēn-bērg, **Julius**, German poet: b. Rodenberg, Hesse-Nassau, 26 June 1831. He came of a Jewish family of the name of Levy, but adopted the name of his birthplace for his own. He was educated at the universities of Heidelberg, Göttingen, and Berlin, afterward devoting himself to literature and traveling, and since 1874 has been editor of the 'Deutsche Rundschau.' His publications include: 'Jour-

nalistic Life in London' (1859); 'Pictures of Berlin Life' (1885-8); fiction, 'The New Deluge' (1865); 'The Grandidier' (1878); etc.

Rodenbough, rō'dēn-bow, **Theophilus Francis**, American army officer: b. Easton, Pa., 5 Nov. 1838. He was educated at Lafayette College, and in 1861 was appointed second lieutenant in the United States army. In the peninsular campaign of 1862 he was captured at Manassas, but was soon exchanged, and at the battle of Gettysburg was in command of a regiment. He was engaged at Winchester, losing an arm in that battle, and was brevetted major for his bravery. In 1865 he was brevetted brigadier-general of volunteers, mustered out of the volunteer service, and was appointed major in the regular army. In 1870 he was retired with full rank as colonel. He was secretary of the Military Service Institution in 1879, its vice-president in 1890-1, assistant inspector-general of New York in 1880-3, and in 1890-1901 chief of the bureau of elections in New York. He has written: 'From Everglade to Cañon with the Second Dragoons' (1875); 'Afghanistan and the Anglo-Russian Dispute' (1886); 'Uncle Sam's Medal of Honor' (1887); 'Sabre and Bayonet' (1897); etc.

Roden'tia, or **Glires**, an extensive order of Mammalia, represented by such forms as mice, beavers, porcupines, squirrels, rabbits, lemmings, etc. Of the characteristics tooth structures are the most important. The canines are always absent and the incisors large and chisel-like, and, with the exception of the *Leporidae*, which have four in the upper jaw, never more than a single pair in each jaw. These teeth consist each of a front layer of hard enamel and a posterior part of softer dentine, which ensures a persistent sharp edge, since the more rapid wearing of the softer dentine leaves the harder enamel of the front surface as a chisel-like edge. These teeth continue to grow from persistent pulps throughout life. The incisors are long and curved, and each forms a segment of a circle. Between the incisors and the molar teeth a wide interval exists. The molars are few, and their crowns may exhibit a variously laminated or tuberculate pattern. This structure of the molars has relation to the motion of the jaws in gnawing, the jaws being so articulated by narrow condyles fitting in longitudinal grooves that they slide backward and forward instead of moving vertically, as in most other animals. The transverse ridges of the molar teeth act therefore in opposition to this sliding motion of the jaws. The molars in some cases (as in the beavers) also grow from persistent pulps and possess undivided fangs. There is always a succession of milk and permanent dentitions. The chief chewing muscle is the masseter, which is greatly developed, while the temporal muscle is small.

The usual number of toes is five on both feet, but the pollex may be rudimentary or absent, and in the hind feet the number may be reduced to four, as in the hares, or to three, as in the agouti, jerboa, etc. Generally they are all clawed, but sometimes, as in the capybara, have hoof-like terminations. The scapula is narrow and remarkable for the long acromion process, and the clavicles are generally well developed, but may be imperfect or absent, as in the hares and guinea-pig. The femur generally possesses

RODENTIA

a third trochanter, and the tibia and fibula are distinct or, as in the rats and hares, united. The beaver has the hind feet webbed, to adapt it for its semi-aquatic life. Some rodents have the hind legs of extreme length, as the jerboas. Usually a more or less complete hairy screen extends across the mouth at the narrow region of the palate behind the incisor teeth, thus preventing the entrance into the hinder portion of the mouth of the chips or dust that result from gnawing operations. Many rodents are provided with cheek-pouches for carrying food; usually these open within the mouth, but in the *Geomys* they open externally.

The stomach, generally a simple structure, may in some forms, as the lemmings, become quite complex, and its anterior portion as in beavers, may be provided with glandular appendages. This same portion in the dormouse is glandular and dilated so as to resemble the proventriculus or digestive stomach of birds. A large sacculated cæcum generally exists, and the intestine is usually very long. A gall-bladder is sometimes wanting. The surfaces of the cerebral hemispheres are smooth or destitute of convolutions, and, when viewed from above, the cerebellum is seen to be in great part uncovered by the cerebrum. The corpus callosum is well developed. The penis is usually retractile and contains a bone, and the testes normally remain in the abdomen, but descend periodically into the groin at the breeding seasons. The uterus is frequently completely divided into two cornua or horns, each of which opens separately into the vagina. In others the two cornua unite to form a single uterus or womb. The placenta is of the deciduate type, and of discoid form. Rodents are extremely prolific. Most species of rodents have characteristic and penetrating odors which arise from scent glands variously located in the vicinity of the anus. The skin, generally covered with hair, is spiny in the porcupines (q.v.), some genera of which group possess prehensile tails. Many of these animals furnish furs of value in commerce.

Extent and Classification.—This is by far the largest order of mammals, comprising more than 2,000 species. Rodents are found in all parts of the world, but are poorly represented in the Australian region and on Madagascar, and are altogether absent from certain oceanic islands. In South America they reach their maximum development. With a very few exceptions, such as the house-rats and the muskrat, they are exclusively herbivorous, and different species subsist upon grains, nuts, bark, roots, herbage, etc. Notwithstanding their great structural similarity the rodents have fitted themselves to the most varied environmental conditions, and present many remarkable adaptations and interesting habits. Most of them are terrestrial; many, like the mole-rats, rabbits, and prairie marmots, are burrowers; some, as the beaver and muskrat, are aquatic; many squirrels and others are arboreal. They run, leap, climb, or, like the flying squirrels and *Anomalurus*, sail through the air on skinny parachutes. Some, as the woodchuck, are solitary; many are gregarious, like the rats and mice, colonial like the rabbit and prairie marmot, or even, like the beaver, form co-operative societies and exhibit wonderful building instincts. Migratory movements of large parties of rodents are not infrequent, the most remarkable of which

are the well-known migrations of the lemmings. Although generally of small size, the rodents have gained a dominance both of species and individuals through their great fecundity and their ability to gnaw out a living beyond the reach of most animals. Their wariness and secretiveness have aided no little toward their preservation, though they form the chief subsistence of a host of snakes, birds of prey, and small carnivorous mammals. Human interests are affected by these animals in a variety of ways. Some of them furnish food, furs, or sport, others are interesting pets, but the great majority are injurious to agricultural interests. No less than 400 species and many additional subspecies have been described as occurring within the limits of North America, the great majority being mice.

The following is a modern classification of the order, though some mammalogists recognize a larger number of families:

GROUP SIMPLICIDENTATA.—There is a single pair of upper incisors with the enamel layer confined to the anterior surface; the fibula does not articulate with the calcaneum. Three suborders:

I. *Hystricomorpha*, or porcupine-like rodents: tibia and fibula distinct, alveolus of lower incisor ending on the medial side of the ramus of the lower jaw, only one premolar in each jaw. Families: *Octodontida*, containing the coypu and many others chiefly of South America, but a few in Africa; *Hystricida*, the porcupines; *Chinchillida*, chinchillas of South America; *Dasyproctida*, agoutis, etc., of South America; *Dinomys*, containing a single generalized rodent of Peru; *Caviida*, the cavies or guinea-pigs and capybara of South America.

II. *Sciuromorpha*, or squirrel-like rodents: tibia and fibula distinct from each other, the alveolus of the lower incisor penetrating the ramus of the lower jaw and the premolars one or two on each side above and one on each side below. Families: *Sciurida*, the squirrels and marmots, found throughout the world except Australia; *Anomalurida*, peculiar squirrel-like animals with extensive parachutes along the sides, found in tropical Africa; *Haplodontida*, *Haplodon*, of the Rocky Mountains; *Castorida*, the beavers, of the northern hemisphere.

III. *Myomorpha*, or rat-like rodents: tibia and fibula coalesced, lower incisors as in the squirrels, premolars $\frac{3}{2}$ to $\frac{1}{1}$. Families: *Dipodida*, jumping mice, jerboas, etc., North America, Europe, Asia, and Africa; *Murida*, the rats and mice, a very extensive and cosmopolitan group which is variously subdivided; *Myoxida*, dormouse of Europe and other Old World forms; *Geomyida*, pouched gophers and pouched mice of America; *Lophiomyida*, a remarkable arboreal African form; *Spalacida*, the mole rats and their allies of the Old World.

GROUP DUPLICIDENTATA.—Besides the large incisors, the enamel covering of which extends all around, there is a second pair in the upper jaw; the fibula articulates, with the calcaneum and the ankle and elbow joints are tongued and grooved; tibia and fibula co-ossified. One suborder: *Lagomorpha*, hare-like rodents, with two families: *Leporida*, hares and rabbits, cosmopolitan; *Lagomyida*, picas or whistling hares, North America and Europe.

Fossil Rodentia.—Rodent remains first occur in a fossil state in the Eocene Period, in which remains of forms allied to the dormice, porcupines, and squirrels exist. In Pliocene and post-Pliocene formations they become tolerably plentiful. Of the post-Tertiary forms, *Trogontherium*, or the great beaver, found in European deposits, is a familiar species, and the cave beaver (*Castor spelæus*) is also a notable form. *Trogontherium* may possibly have survived the human period. The hares and rabbits first occur as fossils in Lower Miocene of North America and Pliocene of Europe, and the rats and mice are found in Eocene, Miocene, and Pliocene formations. The guinea-pigs are chiefly Pleistocene, their remains occurring in the Brazilian bone caves of that age. Some of the extinct rodents were as large as an ox. Very little light has been thrown on the origin of the order by a study of the fossil forms, though Professor Cope believed the Tillodonta to be their ancestors.

Bibliography.—Consult the articles in this work on the various animals included in the order, and the following: Coues and Allen, 'Monographs of North American Rodentia,' United States Geological Survey of Territories (Washington 1877); Elliot, 'Synopsis of the Mammals of North America,' Field Columbian Museum (Chicago 1901); Beddard, 'Mammals' (London 1902); Alton, 'On the Classification of the Order Glires,' Proc. Zoological Society (London 1876); Woodward, 'Vertebrate Paleontology' (Cambridge 1898); and numerous papers by Merriam, Miller, Palmer, and others in the 'Bulletins' of the Biological Survey of the United States Department of Agriculture.

Roderick, rōd'ēr-ik (Spanish, RODRIGO), last king of the West Goths in Spain. In 710 he was chosen king. Shortly after the Moors, under Muza, invaded Spain. Roderick met the invaders on the banks of the Guadelete in 711, but was defeated, and perished in the battle. Some accounts declare that he maintained resistance for two years longer. He is the hero of Scott's 'Vision of Don Roderick' (1811) and Southey's 'Roderick the Goth' (1814). Consult: Toilhan, 'Chronique Rimée des Derniers Rois de Tolède' (1885); Dozy, 'Geschichte der Mauren in Spanien' (1874); Saavedra, 'Estudio sobre la invasion de los Arabes' (1895).

Rodgers, rōj'ēr-z, **Christopher Raymond Perry**, American naval officer: b. Brooklyn, N. Y., 14 Nov. 1819; d. Washington, D. C., 8 Jan. 1892. He entered the United States navy as a midshipman in 1833, commanded the schooner Phoenix in the Seminole war in 1840-1, was engaged in blockading service in the Mexican War, and served in the trenches at Vera Cruz and at the capture of Tobasco and Tuspan. He was commissioned commander in 1861, was fleet-captain at the Battle of Port Royal, and also in the attack on the defenses of Charleston in 1863. He was then appointed to command the steam sloop Iroquois and was engaged in special service until the close of the War. He became commodore in 1870, and in 1874 received rank as rear-admiral. He was superintendent of the Naval Academy in 1874-7, in command of the naval forces in the Pacific in 1878-80, and from then until his retirement in 1881 was again superintendent at the academy. He presided

over the convention held in Washington in 1885 for fixing a prime meridian and universal day.

Rodgers, John, American naval officer: b. Harford County, Md., 11 July 1771; d. Philadelphia 1 Aug. 1838. He entered the naval service in 1789, and in 1798, as lieutenant and executive officer of the frigate Constellation, captured a French vessel, for which service he was promoted captain in 1799. In 1802 he was appointed to the Mediterranean squadron then engaged in the war with Tripoli, in the success of which he was largely instrumental. He succeeded Commodore Barron in the command of the squadron in 1805, and in this office rendered a valuable diplomatic service in securing treaties from Tripoli and Tunis which established the friendly relations since existing between those countries and the United States. In 1812 Commodore Rodgers, in command of the Atlantic Squadron, was the first to fire upon the British, and during the campaign captured some 23 English vessels. He was president of the Board of Naval Commissioners 1815-37, except during the three years 1824-7, when he was again in command of the Mediterranean Squadron.

Rodgers, John, American naval officer, son of the preceding: b. Harford County, Md., 8 Aug. 1812; d. Washington, D. C., 5 May 1882. He was commissioned lieutenant in 1840, and was engaged in the hostilities with the Seminoles from 1840 to 1843. Subsequently he performed a valuable service in surveying the Florida coast. His explorations from 1852 to 1861 in the North Pacific and China seas, and in the Arctic Ocean were also of much scientific and commercial importance. As commander of the monitors Weehawken, Dictator, and Monadnock he took a prominent part in the Civil War. He was made commodore in 1863, and in 1869 commissioned rear-admiral in command of the Asiatic fleet. In this office he rendered valuable service as a diplomat by establishing the safety of American commerce in Korea. At his death he was superintendent of the naval observatory at Washington.

Rodin, rō-dăn, **Auguste**, French sculptor: b. Paris November 1840. After working in a subordinate position in several studios he exhibited for the first time in the Salon in 1875, and since then became well known as a sculptor utterly beyond the control of classical convention, and reveling in the first expression of emotion and action, yet showing a power of execution worthy of the best Renaissance art. His statue of Balzac, ordered by the government, was so palpably an attempt to suggest by a plastic achievement something beyond the range of sculpturesque expression, that it was rejected when exhibited as a cast. Yet he has done some remarkable work, as for instance 'The Brazen Age,' exhibited as a cast, and after much discussion executed in bronze for the Luxembourg Gardens. Among other rugged and fantastic creations are 'Burghers of Calais'; 'The Kiss.' He has made busts of Bastien-Lepage, Victor Hugo, Henri Rochefort, and Jules Daloux, the sculptor.

Rodman, rōd'man, **Isaac Peace**, American soldier: b. South Kingston, R. I., 18 Aug. 1822; d. Sharpsburg, Md., 30 Sept. 1862. He engaged in business as a woolen manufacturer, served several terms in the Rhode Island legislature and

in 1861 resigned his seat in the state senate, organized a company, of which he was commissioned captain, and went to the front. He was promoted lieutenant-colonel for gallantry at the first battle of Bull Run, fought at Roanoke Island and at New Berne, N. C., and in 1862 was commissioned brigadier-general of volunteers. He commanded a division at Antietam in 1862 and while leading a charge was mortally wounded.

Rodman, Thomas Jefferson, American military officer: b. Salem, Ind., 30 July 1815; d. 7 June 1871. He was graduated from the ordnance department of West Point in 1841, and was appointed to service at various arsenals, where his experiments in the manufacture of guns soon brought him into prominence. His method of casting guns on a hollow core, the metal being cooled by a stream of water running through the inside, was adopted in 1847. This method he later applied to shells and cannon. In 1860 he completed his experiments upon a 15-inch gun for the uses of mammoth powder, the cannon which bears his name. The Rodman gun and mammoth powder were adopted by the United States government in the following year, and soon after by Russia, England and Prussia. In 1865 he was brevetted brigadier-general, and four years before his death promoted to the rank of lieutenant-colonel.

Rodman Gun. See **ORDNANCE**.

Rodney, rōd'nī, Cæsar, American patriot: b. Dover, Del., 7 Oct. 1728; d. there 29 June 1784. He was the grandson of William Rodney, a large landholder under the Duke of York, in the grant to William Penn, and member of Penn's council. As high sheriff of Kent County and judge of all the lower courts of the Province of Delaware, Cæsar Rodney came into prominence as a statesman. He was a delegate to the Stamp Act Congress held in New York in 1765, and as speaker of that body was largely instrumental in bringing about the first Continental Congress, of which he was also a member. In this capacity he was one of the signers of the Declaration of Independence. In 1775, after the second session of the Congress at Philadelphia, he journeyed through his native province sowing the seed of independence, and was appointed brigadier-general in the army under Washington at the beginning of the Revolution. As commander of the Delaware militia he rendered valuable service, for which he was made a major-general in 1777. In this year also he was made president of the State of Delaware, from which office he retired in 1782.

Rodney, Cæsar Augustus, American statesman, son of Cæsar Rodney (q.v.): b. Dover, Del., 4 Jan. 1772; d. Buenos Ayres, Argentina, 10 June 1824. He was graduated from the University of Pennsylvania in 1789, and after his admission to the bar in 1793 practised law in Wilmington, Del. On account of his election to Congress as an anti-Federalist in 1805 he has been called the first Democrat in that body. In 1807 he was appointed attorney-general of the United States by President Jefferson, but resigned this office in 1811, and in the War of 1812 took active part on the Canadian frontier as captain of artillery. In 1821 he again represented Delaware in Congress, and in the following year took his seat in the United States Senate. In 1823 he was appointed minister plenipotentiary to the Argentine provinces.

Rodney, George Brydges, 1ST BARON RODNEY, English naval commander: b. Walton-upon-Thames, and baptized 13 Feb. 1718; d. London 23 May 1792. He became a lieutenant in 1739, first obtained a ship in 1742 and in 1748 went to Newfoundland as governor. On his return in 1751 he was elected member of Parliament. In 1759 he was promoted rear-admiral, and in 1761 sailed to the West Indies, reduced Martinique and took possession of St. Lucia, Grenada and St. Vincent. In 1762 he became vice-admiral and in 1764 was made a baronet. The next year he became governor of Greenwich Hospital. In 1779, having already been promoted to the rank of admiral, he was put in command of a fleet bound for the West Indies with instructions to relieve Gibraltar on his way. This latter was accomplished on 16 Jan. 1780 by capturing or destroying seven ships of the fleet of the Spanish admiral, Don Juan de Langara. Continuing on to the West Indies he encountered the French fleet under Guichen, near Martinique, with indecisive results, though with considerable loss on both sides. In April 1782, he again met a French fleet in the West Indies, this time commanded by Count de Grasse; and after a three days' fight overcame the French, captured de Grasse and his flagship, the *Ville de Paris*, but forewent the larger part of his spoil by not giving chase. Before the news of the victory reached England, Admiral Hugh Pigot had been sent to supersede Rodney, and though he retired from active service, he was rewarded with a pension and a barony. Consult: Mundy, 'Life and Correspondence of Lord Rodney' (1830); Hannay, 'Rodney' ('English Men of Action').

Rodriguez, rōd-rē'gēs, a volcanic island in the Indian Ocean; about 375 miles east by north of Mauritius (q.v.), of which it is a dependency. It is 18 miles long by 7 miles wide, and the altitude is about 1,750 feet. It is surrounded by a coral reef. Its isolation has prevented change in its flora and fauna, and for this reason the island has been of interest to the botanist and the zoologist. Until near the end of the 17th century the solitarie, now an extinct bird, was found on this island. The island was discovered by the Portuguese in 1645, and since 1814 it has been a British colony.

Roe, Charles Francis, American soldier: b. New York 1 May 1848. He was graduated at West Point in 1868 and entered the 1st cavalry, being assigned to frontier duty. In 1870 he was transferred to the 2d cavalry; became 2d lieutenant in 1871 and 1st lieutenant in 1880. In his early days in the West he rode 22½ hours from Camp Harney, Ore., to Fort Bidwell, Cal., to carry orders to prevent an Indian outbreak. In 1888 he resigned from the army and engaged in real estate business in New York. He became major of Troop A, New York Volunteer Cavalry, in 1895, and later was appointed major-general. President McKinley appointed him brigadier-general of United States volunteers in June 1898, but he resigned in the following September.

Roe, Edward Payson, American Presbyterian clergyman and novelist: b. Moodna, New Windsor, Orange County, N. Y., 7 March 1838; d. Cornwall, N. Y., 19 July 1888. He studied at Williams College, and at Auburn and Union theological seminaries; was ordained to the Presbyterian ministry; in 1862-5 was a chaplain

in the volunteer service; and from 1865 until his resignation in 1874 held a Presbyterian pastorate at Highland Falls, N. Y. There his addresses on topics of the Civil War gained for him some notice as a speaker. In 1874 he removed to Cornwall-on-Hudson, N. Y., where he cultivated small fruits and turned out a series of novels which sold largely (759,000 copies, it was estimated, at his death) and met with widespread interest, but quite lacked distinction or literary quality. Among the titles are: 'Barriers Burned Away' (1872); 'Opening a Chestnut Burr' (1874); 'A Knight of the 19th Century' (1877); 'A Face Illumined' (1878); 'Driven Back to Eden' (1885); and 'The Earth Trembled' (1887). He published also three books on horticulture. Consult 'E. P. Roe: Reminiscences of his Life,' by his sister, May Roe (1899).

Roe, Francis Asbury, American naval officer: b. Elmira, N. Y., 4 Oct. 1823; d. Washington, D. C., 28 Dec. 1901. He entered the naval service in 1841 as acting midshipman on the John Adams, and received his later training at the Naval Academy at Annapolis, and in service in various parts of the world. He was executive officer of the flagship Vincennes during the Arctic exploring expedition of 1855, and was made a lieutenant in that year. At the outbreak of the Civil War he was appointed executive officer of the Pensacola, which was in the van of Farragut's fleet, and was especially commended for bravery during the famous passage of Fort Jackson and Fort St. Philip. In 1862 he was ordered to the gunboat Kataldin and upon the first day of his command fought the battle of Baton Rouge. For this service he was promoted to the rank of lieutenant-commander. On 5 May 1864, in command of the Sassacus, he defeated the Confederate ram Albemarle and the gunboat Bombshell near Plymouth, N. C. As commander of the Gulf Division of Rear-Admiral Palmer's squadron at Vera Cruz he rendered noteworthy service as negotiator between the forces of Gen. Juarez and the governor of Vera Cruz, and received the surrender of that city in 1867. From 1869 to 1871 he was with the Asiatic fleet and was commissioned captain in 1872. In 1884 he was promoted rear-admiral and was retired the following year.

Roe, Richard. See DOE, JOHN.

Roe-deer, a small European deer (*Capreolus caprea*), the adult measuring about two feet at the shoulders and about 2½ feet at the hind quarters. The buck's antlers are small, and provided with three short branches only. The general body-color is a brown. The tail has a white patch at its root and the chin, belly and inner aspects of the limbs are grayish-white. These animals inhabit mountainous districts, and are monogamous, each male remaining faithful throughout life to one female. The habits of the roe are somewhat like those of the goat, or even of the chamois. It keeps its footing on rocks with great security, bounds very actively, and takes great leaps. Its usual pace, when not very hard pressed, is, however, a kind of canter. It is not gregarious, not more than a buck and doe with one or two fawns being usually seen together. The voice of the

roe-deer, resembling that of a sheep, but shorter and more barking, is often heard through the night. The roe browses on the tender shoots of trees and bushes as well as on herbage, and is thus very injurious to young woods. It is never very thoroughly tamed, and when kept in parks is apt to become mischievous, and the male dangerous. The venison is superior to that of the stag, but not equal to that of the fallow deer. The horns are used for handles of carving knives and similar articles.

Roebling, réb'ling, **John Augustus**, American civil engineer: b. Mühlhausen, Prussia, 12 June 1806; d. Brooklyn 22 July 1869. He was graduated at the Royal Polytechnic School in Berlin in 1826, his thesis being on suspension bridges. He came to America in 1831 and settled in Pittsburgh, Pa. Later he was engaged in surveying the lines of the Pennsylvania railroad across the Allegheny Mountains from Harrisburg to Pittsburgh. Having spent some years thereafter in the manufacture of iron and steel wire he utilized his new product in 1844-5 in building an aqueduct across the Allegheny River at Pittsburg, consisting of a wooden trunk supported by wire cables. The bridge comprised seven spans each 162 feet long. In 1846 he built a suspension bridge over the Monongahela River at Pittsburg, and after building several other bridges removed his business to Trenton, N. J., and in 1851 began the construction of the suspension bridge across Niagara River, connecting the New York Central and the Canadian Railway systems. He next built the bridge over the Allegheny River at Pittsburg and during 1856-67 the bridge connecting Cincinnati and Covington. In 1868 he was chosen chief engineer for the construction of the Brooklyn Bridge; but he died the following year from the effects of an injury to one of his feet. The completion of the structure was carried out by his son. He was the author of 'Long and Short Span Railway Bridges' (1869).

Roebling, Washington Augustus, American civil engineer: b. Saxenburg, Pa., 26 May 1837. He was graduated at the Rensselaer Polytechnic Institute, Troy, N. Y., in 1857, and joined his father, John A. Roebling (q.v.), in the construction of the suspension bridge across the Allegheny River at Pittsburg. He served in the Union army, 1861-5; was brevetted lieutenant-colonel in December 1864 for gallant service before Richmond and colonel of volunteers in March 1865 for meritorious service during the war. He joined his father in building the Cincinnati-Covington suspension bridge and became assistant engineer in constructing the Brooklyn bridge. After his father's death in 1869 the entire direction of the work was left in his hands and the bridge was completed in 1883. Since that date he has been engaged as vice-president of the iron and steel wire and wire rope manufacturing concern of John A. Roebling & Sons Co. of Trenton, N. J.

Roeblingite, a white, massive mineral, recently found at Franklin Furnace, N. J., having the remarkable composition $H_{10}Ca_2Pb_2Si_3S_6O_{28}$, which is interpreted by Penfield as being a combination of five molecules of the silicate H_2CaSiO_4 with two molecules of the basic sulphite, $CaPbSO_4$. This is the only known occur-

rence of a sulphite in nature. Named after W. A. Roebing.

Roebuck, rō'būk, John Arthur, English politician: b. Madras, India, 29 Dec. 1802; d. London, England, 30 Nov. 1879. He was called to the bar in 1831. In 1832-7 and in 1841-7 sat in Parliament for Bath, and for Sheffield in 1849-68 and again from 1874 until his death. He defended the Crimean war, favored the Confederacy in the United States, and supported Beaconsfield in his Eastern policy in 1877-8. In 1879 he became a member of the privy council. He wrote: 'Colonies of England' (1849); 'History of the Whig Ministry of 1830' (1852); etc.

Roediger, ré'dīg-ēr, Emil, German Orientalist: b. Sangerhausen, Thuringia, 13 Oct. 1801; d. Berlin 15 June 1874. He studied at Halle, where in 1830 he became extraordinary and in 1835 ordinary professor of Oriental languages. He removed to a similar post in Berlin in 1860 and remained there until his death. He continued the work of Gesenius' 'Novus Thesaurus Philologicus Criticus Linguae Hebraeae et Chaldaee Veteris Testamenti, Editio ii.' with indexes, additions, and corrections (1858). He edited Gesenius' 'Hebrew Grammar,' and wrote 'De Origine et Indole Arabicæ Librorum V. T. Historicorum Interpretationis Libri Duo' (1829).

Roelofs, ré'lōfs, Willem, Dutch painter and naturalist: b. Amsterdam 10 March 1822. He early made his home in Utrecht, where he learned to appreciate the beauty of the Netherlands landscape. In 1845 he began his art career in The Hague and three years later went to Brussels, thus completing his studies of the Dutch masters. From Belgium he passed to France and received the great artistic impulse of his life from the French landscape painters who represent the aspects of nature as interpretative of spiritual moods. Thus he learnt to depict what we may style the transitions of color and light in scenery with a certain dramatic intensity, and preferred the portrayal of dazzling light effects, and violent contrasts in color; as when the sunlight pours like a torrent through gaps of leafage into the dark forest depths. He has traveled through the whole of Holland and gathered subjects and *motifs* for his pictures from many obscure and unfamiliar spots, painting with equal facility in oil and water color. He is also a skilful etcher. As a naturalist he is well known among students of entomology.

Roentgen, rént'gēn, Wilhelm Konrad, German physicist: b. Lennep, Prussia, 27 March 1845. He was educated at Zürich; became Kundt's assistant at Würzburg in 1870, and at Strasburg in 1872; was made lecturer at the latter in 1874; and professor extraordinary in 1876. In 1879 he was appointed professor ordinary at Giessen, in 1888 at Würzburg, in 1899 at Munich. He published in the 'Annalen der Physik und Chemie' the results of numerous experimental labors; but he is best known for his discovery in 1896 of the Roentgen rays (see X-RAYS) which proved capable of such wide application in surgery and other fields, and for which he received in 1901 the Nobel prize for physics.

Roga'tion Days, the Monday, Tuesday and Wednesday next before Ascension Day: so called because they are observed as days of solemn supplication, with processions and chanting of the Litanies (Greek, *litaneia*, supplication; equivalent to Latin *rogatio*). The custom of processions on these days had its rise in the city of Vienne in Gaul about the middle of the 5th century, when, the city having been visited with earthquakes, fires, and other grave calamities, the bishop, Saint Mamertus, ordered a solemn fast and public supplication of three days to appease the divine indignation: and thereafter the three days' supplication was practised annually, the custom spreading throughout Gaul and beyond the Alps. Everywhere these processions were suppressed in England after the triumph of the Reformation, yet in some localities the perambulation of the boundaries of parishes on the "gang-days" is said still to be kept up. See also LITANY.

Roger I., count of Sicily: b. Normandy about 1031; d. Mileto, Calabria, 1101. Roger's brothers, Drago, Humphrey, William, and Robert Guiscard, had acquired fame in Italy, and obtained possession of the county of Aversa, when he was summoned thither by his brother, Robert, and landed in Apulia in 1057. The two brothers, Robert, the eldest, and Roger, the youngest, founded the kingdom of the Two Sicilies. Roger in 1063 defeated the Saracens at Ceramium, and was thereupon confirmed by the pope in all his conquests in Sicily. He took the title of Count of Sicily, and in spite of certain disputes between the brothers, the complete subjugation of Sicily was the result of their joint efforts. After the death of Robert Guiscard in 1085 the Norman power in Italy came into Roger's hands. The general support given to him by the pope freed him from many dangers. In 1098 he gave him a free brief (the genuineness of which has, however, been questioned), that he would send no legate to Sicily without Roger's consent, and left it to him to decide what bishops should attend the general assemblies of the Church and whom he should detain for the service of the kingdom. With this extension of his spiritual rights Roger introduced many important improvements. Consult Schack, 'Geschichte der Normanen in Sicilien' (1889).

Roger II., king of Sicily: b. about 1095; d. February 1154, second son of Roger I. His elder brother, Simon, died in 1102, and during his minority the government was administered first by his mother, Adelheid, a daughter of the Margrave Boniface of Montserrat, and then by Prince Robert of Burgundy. The free barons of the land, however, leagued with Pope Honorius II. to break the Norman ascendancy. They had no success, and the pope voluntarily confirmed Roger in the possession of Apulia and Calabria. Pope Anacletus extended the confirmation to Capua and Naples; and in 1130 Roger received the title of king. He now pressed so hard upon the barons that Rainulf of Avellino, Robert of Capua, Servius of Naples, and others revolted, receiving support from the German and Greek emperors, Lothar and Emmanuel, and the influence of the anti-pope, Innocent II., who excommunicated the Sicilian monarch. Roger in 1132 was defeated by them in

an engagement; but having promptly assembled a new army suddenly recovered all he had lost, and although the revolt lasted till 1136 it terminated to Roger's advantage. He took Malta and the adjacent islands, and afterward made himself master of Tripoli. With a second fleet he sailed to Madia, and took it in 1148. At the same time he led an expedition against the kingdom of Greece, in which he took Corfu and Thebes, and plundered Corinth, Athens, Cephalonia, and Negropont. In 1152 he extended his dominion from Tripoli to Tunis, and from the desert of Mohrab to Kairwan. The peace which followed he turned to good account, reforming the law, introducing order into the administration, and patronizing science. Consult Schack, 'Geschichte der Normannen in Sicilien' (1889).

Roger de Hoveden, English historian: lived in the last half of the 12th century; d. Hoveden, now Howden, East Riding of Yorkshire. He was a lawyer, in holy orders, and lived at the court of Henry II., whom he served in many diplomatic and professional capacities. His latter days were spent as a prebend of the collegiate church at Howden, to which he had retired on the death of his royal master. The history or chronicle which he wrote during his half monastic retirement was based upon 'Historia Saxonum vel Anglorum post Obitum Bedæ' (1101). The main additions made by Roger de Hoveden to this work include: the miracles of Edward the Confessor; an abstract of the charter by which Hominburgh and Brackenholm were ceded by William the Conqueror to Durham; a list of French knights at the siege of Nice. Naturally the most valuable part of the Chronicle is that which relates to the time in which Roger lived (1169-92). Edward I. in 1291 caused diligent efforts to be made to secure a copy of it, that he might collect therefrom evidence bearing on the vexed question as to the homage due the king of England from the Scottish Crown. The Chronicle was first printed in 1696. Consult Morley, 'English Writers' (Vol. III.).

Roger of Wendover, English chronicler: d. 1237. He was a monk in Saint Alban's Abbey, and lived to be prior of Belvoir. His chronicle extends from 1189 to 1235, and bears the title 'Flores Historiarum' in the 'Historia Major.' His collaborator was John de Cellis, and the work was continued by Matthew of Paris. Consult Morley, 'English Writers.'

Roger Williams University, an institution for the education of the colored race at Nashville, Tenn. It was established in 1863 by the Baptist Home Mission Society. Its work is in three grades, elementary, secondary, and collegiate; a classical, a scientific, an English, and a normal course are offered; there is also provision for professional instruction and for industrial training in printing, sewing, etc. The institution is supported by the Baptist Home Mission Society and by tuition fees; there is no endowment; the income in 1903 amounted to \$9,400; the grounds and buildings were valued at \$150,000; and the library contained 6,000 volumes. The students in the year 1903-4 numbered 250, and the faculty 14.

Rogerenes, rōj'ēr-ēnz, **The**, the name given a former evangelical sect at New London,

Conn. They were of non-resistant principles, and were resolutely opposed to any dictation regarding religious observances, aside from the teachings of the New Testament.

Rogers, rōj'ēr-z, **Fairman**, American civil engineer: b. Philadelphia 15 Nov. 1833; d. Vienna, Austria, 23 Aug. 1900. He was graduated from the University of Pennsylvania in 1853, was lecturer on mechanics at Franklin Institute, Philadelphia, in 1853-65, and professor of civil engineering at the University of Pennsylvania 1855-70. He was a volunteer in the Union army in 1861 and completed the survey of the Potomac River northward from Blakiston Island in 1862. He was a trustee of the University of Pennsylvania in 1871-86, presented to the university a valuable library of works on engineering in 1878, and finally resigned his trusteeship because of continued residence abroad. Besides various valuable scientific papers he wrote: 'Terrestrial Magnetism and the Magnetism of Iron Ships' (1883); and 'Manual of Coaching' (1900).

Rogers, **Henry**, English Congregational clergyman and essayist: b. St. Albans 18 Oct. 1806; d. Pennal Tower, Machynlleth, Wales, 20 Aug. 1877. He studied at Highbury College and became a Congregationalist minister at Poole, Dorsetshire, in 1829. Three years later he was appointed lecturer on rhetoric and logic in Highbury College, and in 1836 became professor of English language and literature in University College, London. He was made professor of English language and literature and mental philosophy in Spring Hill College, Birmingham, in 1839, and held that post till 1858 when appointed principal and professor of theology in the Lancashire Independent College. From 1839 he contributed regularly to the 'Edinburgh Review,' some of his contributions to that periodical being collected in 'Essays Critical and Biographical' (1874), and 'Essays on Some Theological Controversies' (1874). His chief work, 'The Eclipse of Faith,' a piece of skilful dialectics, was published anonymously in 1852, being followed by a 'Defence of the Eclipse of Faith' (1854), in which he replied to F. W. Newman's reply to his earlier work.

Rogers, **Henry Darwin**, American geologist: b. Philadelphia 1 Aug. 1808; d. near Glasgow, Scotland, 29 May 1866. He was appointed professor of physical sciences at Dickinson College, Carlisle, Pa., in 1830, studied in London in 1831, was lecturer on geology at Franklin Institute in 1833-4, and in 1835-46 was professor of geology and mineralogy at the University of Pennsylvania. In 1835 he made a geological survey of the State of New Jersey, and was appointed geologist in charge of the survey of Pennsylvania in 1836. The survey was interrupted in 1841-51 by lack of appropriations, and Rogers was engaged as an expert for various coal companies, until he resumed the survey which was then concluded in 1854. The final report of the survey was entrusted to him, and he completed the work in Edinburgh. From 1857 until his death he was professor of geology and natural history at the University of Glasgow. He published: 'Description of the Geology of the State of New Jersey' (1840); 'The Geology of Pennsylvania, a Government

Survey' (1858); numerous geological reports, etc.

Rogers, Henry H., American capitalist: b. Fairhaven, Mass. He was educated in the schools of his native town, and afterward became connected with the Standard Oil Company, of which he is at present a large stock-holder and a vice-president. Of the great wealth acquired through his numerous business enterprises he has devoted large sums to public and benevolent uses, especially for the benefit of Fairhaven. Among his gifts to the town are two schools, a town hall, the Millicent Library (a memorial to his deceased daughter), a Masonic building, and memorial church buildings, comprising a group said to be excellent examples of Tudor architecture, the church itself being perhaps the finest of its size ever built in America. These buildings were erected in memory of the giver's mother. He has also built at Fairhaven, and presented to the Millicent Library, a system of waterworks from which it derives an income; and as superintendent of streets he has made, presumably in great part at his own expense, vast improvements in the public highways.

Rogers, Henry J., American inventor: b. Baltimore, Md., 1811; d. there 20 Aug. 1879. He is known as the inventor of a code of flag signals, adopted by the United States in 1846, and was also the originator of a code of signals in which colored lights are used. As an associate of Samuel F. B. Morse (q.v.) he was instrumental in constructing the first telegraph line, and was the inventor of several important telegraphic instruments, and was one of the organizers of the first telegraph companies in the United States, the Magnetic Telegraph Company, established in 1845. He served in the Civil War as acting master of the volunteer navy. Subsequently he was prominently identified with the American, the Bankers' and Brokers', the Southern and Atlantic, and the Western Union Telegraph companies. His writings include: 'The Telegraphic Dictionary and Seaman's Signal Book' (1845); 'The American Code of Marine Signals' (1854); and, in collaboration with W. F. Larkins, 'Rogers' Commercial Code of Signals for All Nations' (1859).

Rogers, Henry Wade, American lawyer: b. Holland Patent, N. Y., 10 Oct. 1853. He was graduated at the University of Michigan in 1874 and was admitted to the bar in 1877. In 1883 he became professor in the law school of the University of Michigan and was its dean from 1885 to 1890. From 1890 to 1901 he was president of Northwestern University, and in the latter year became connected with the Yale Law School, where he is at present dean. He has written: 'Illinois Citations' (1881), and 'Expert Testimony' (1883).

Rogers, Howard J., American educator: b. Stephentown, N. Y., 16 Nov. 1861. His early education was obtained in public schools and at the Pittsfield, Mass., High School; after graduating in 1880 he entered Williams College, from which he was graduated A.B. in 1884. He was admitted to the New York State Bar in 1887. From 1884-92 he was teacher of history and literature in the Albany Boys' Academy; superintendent of the New York State Educational Exhibit at the World's Columbian Exposition, Chicago, 1892-4; acting-secretary of the

New York Commission there, and editor of the official report of the commission, 1894-5; Deputy-Superintendent of Public Instruction, New York State, 1895-1901; Director of Education and Social Economy for the United States Commission at the Paris Exposition of 1900. At the St. Louis Exposition, 1904, he was Chief of the Departments of Education and of Social Economy, and also Director of Congresses and editor of the Proceeding of the International Congress of Arts and Sciences. In April, 1904, he became First Assistant Commissioner of Education of the State of New York, having charge of Higher Education. He was decorated, in 1901, by the French Republic with the Order of the Legion of Honor of France, and promoted to the rank of *officier* in 1904; in 1904, by King Victor Emanuel III. of Italy, with the Order of Chevalier of Saint Maurice and Lazare; by King Oscar II. of Sweden, with the Order of the North Star; and in 1905, by Emperor William II. of Germany, with the Order of the Red Eagle, rank of officer; and by King Leopold II. of Belgium with the Royal Order of Leopold.

Rogers, Jacob S., American manufacturer: b. Paterson, N. J., 1823; d. New York 2 July 1901. In 1856 he became head of the Rogers Locomotive and Machine Works of Paterson. He retired from active business in 1897, and upon the completion of outstanding contracts closed the works 1 Dec. 1900. He bequeathed the bulk of his estate to the Metropolitan Museum of Art, New York. Litigation was begun by other legatees, but a settlement was effected by the payment to these of \$250,000. The residuary estate, about \$5,000,000, went to the museum.

Rogers, James Edwin Thorold, English economist: b. West Meon, Hampshire, 1823; d. Oxford 12 Oct. 1890. He was educated at King's College, London, and at Oxford, took orders in the Established Church, and appointed curate of St. Paul's, Oxford. After 1860 he lost sympathy with the Tractarian movement and in 1870 was the first to take advantage of the new Clerical Disabilities Relief Act to resign his orders. He received the Tooke professorship of statistics and economic science at King's College, London, in 1859. In 1862 he was elected for five years Drummond professor of political economy at Oxford, but failed of reelection at the end of that term on account of his advanced religious views. He was again elected to the chair in 1888, however, after the death of Bonamy Price, who had held the post in the interval. In 1880 he entered Parliament for Southwark and in 1885 was elected for Bermondsey; but his adoption of Gladstone's home rule policy in 1886 lost him his seat in the general election of that year. His great work is his 'History of Agriculture and Prices in England' (1866-93), covering the period from 1259 to 1793. Based upon this was his 'Six Centuries of Work and Wages' (1884).

Rogers, James Guinness, English Congregational clergyman: b. Enniskillen, Ireland, 29 Dec. 1822. He was educated at Trinity College, Dublin, and at Lancashire Independent College. He held his first charge at Newcastle-on-Tyne in 1846-51, was pastor at Ashton-under-Lyne 1851-65, and from the last-named date until 1902 was minister of the Clapham Congregational Church in London. He has published: 'Priests and Sacraments' (1870); 'Present Day Religion and Theology' (1887); 'Christ for the

World' (1895); 'The Christian Ideal' (1898); etc.

Rogers, John, English Reformed clergyman, first martyr in the Marian persecution: b. Deritend, Aston parish, near Birmingham, about 1500; d. London 4 Feb. 1555. He obtained his education at Cambridge, in 1532-4 was rector of Trinity the Less, London, and then went to Antwerp as chaplain to the English merchants there. There, it is said, he was led by William Tindal, then busy on the translation of the Old Testament into English, to change his religious views. He then took charge of a Protestant congregation at Wittenberg, and prepared for the press an English rendering of the Bible, including Tindal's New Testament, and Old Testament as far as the end of 2 Chronicles. His part in the translation was slight, but his marginal notes formed the earliest English commentary on the Scriptures. The whole constituted the second complete version in English, Coverdale's having appeared in 1535, while this appeared, with the pseudonym "Thomas Matthew" on the title-page, in 1537. In 1548 Rogers returned to England, in 1550 was simultaneously made rector of St. Margaret Moyses, London, and vicar of St. Sepulchre there. In 1551 he received the prebend of St. Pancras in St. Paul's cathedral. In 1553 he preached twice at Paul's Cross, the second time against Catholicism (6 August), three days after Queen Mary's arrival in London. He was shortly deprived of the emoluments of his benefices, on 27 Jan. 1554 imprisoned at Newgate at the instance of Bonner, new bishop of London, and after two examinations (22, 29 January), was burned at the stake at Smithfield; showing, says Fox, "most constant patience, . . . exhorting the people constantly to remain in that faith and true doctrine which he before had taught." Consult Fox, 'Book of Martyrs'; and the biography by Chester (1861).

Rogers, John, American sculptor: b. Salem, Mass., 30 Oct. 1829; d. New Canaan, Conn., July 1904. In early life he developed a talent in clay modeling; and in 1858 went to Europe where he studied under the best masters in Paris and Rome. He returned to the United States in 1859, and modeled a large number of statuettes, of which his first group, 'The Checker Players,' attracted popular attention. Many of these "Rogers Groups" pertained to the Civil War and elicited general popular approval rather than the untinted admiration of the art critic. He also executed the equestrian statue of Gen. Reynolds, now at the city hall in Philadelphia.

Rogers, Randolph, American sculptor: b. Waterloo, N. Y., 6 July 1825; d. 15 Jan. 1892. He studied art in Europe from 1848 to 1850 when he returned to the United States, where he executed a statue of Bulwer's blind heroine 'Nydia' and a figure of President John Adams. He for five years had a studio in New York, but established himself in Rome in 1855. In 1858 he began the bronze doors for the Capitol at Washington and subsequently executed several portrait statues and memorial monuments in Providence, Richmond, Detroit, and other cities. His colossal figures of Gens. Lewis and Nelson, for the Washington monument, which Crawford had begun to raise near Richmond, are good specimens of his work. Among his other statues

is that of Seward in Madison Square Park, New York. Perhaps one of his best works is the figure of the 'Resurrection Angel' for the tomb of Col. Colt in Hartford, Conn.

Rogers, Robert, American author and soldier: b. Dunbarton, N. H., 1727; d. England about 1800. He raised a company of soldiers known as "Rogers' Rangers" and commanded them efficiently during the French and Indian War of 1755-63. He visited England in 1765 and was appointed governor of Mackinaw, Mich., but while holding this office was charged with designs for delivering his own fort to the French and was sent to Montreal in irons. At the outbreak of the American Revolution he declined a commission in the Colonial army, though professing a sincere interest in the cause of the colonies, and later aroused the suspicions of Washington. He was secured but was released on parole, which he broke, accepted a commission in the British army and organized the "Queen's Rangers," recruits to which he promised their "proportion of rebel lands." Shortly after 1776 he went to England. He was proscribed and banished by the provincial government of New Hampshire in 1778. Further traces of his life are lacking. He wrote: 'A Concise Account of North America' (1765); 'Ponteach, or the Savages of America,' a tragedy in verse, now very rare (1766); and 'A Diary of the Siege of Detroit in the War with Pontiac,' first published in 1860.

Rogers, Robert Cameron, American poet: b. Buffalo, N. Y., 7 Jan. 1862. He was graduated from Yale in 1883, and has since published 'Wind in the Clearing and Other Poems'; 'For the King and Other Poems'; and in prose, 'Will o' the Wisp,' a sea tale; and 'Old Dorset: Chronicles of a New York Country Side.'

Rogers, Samuel, English poet: b. Stoke-Newington, London, 30 July 1763; d. London 18 Dec. 1855. After completing his attendance at private school he entered the Rogers banking establishment as a clerk, but his favorite pursuits were poetry and general literature. He went, on one occasion, to pay in person his respects to Dr. Johnson; but hurried away in dread of raising the knocker. In 1786 he printed anonymously 'An Ode to Superstition, with Some Other Poems.' His 'Pleasures of Memory,' with which his name is principally identified, appeared in 1792. It is a carefully finished and graceful production, but somewhat deficient in force and vigor, and though every one is familiar with the name, the 'Pleasures of Memory' is a poem that at the present day is comparatively little read. It was received with unbounded applause, and the reputation of the author was still further confirmed by the publication in 1798 of 'An Epistle to a Friend and Other Poems.' He now built the celebrated house in St. James' Street, Westminster, which he had in part decorated by Stothard and Flaxman; filled with antiques, books, and art-works, all selected in admirable taste; and long made the centre of intellectual society. It ought also to be recorded that, though possessed of much surface brusqueness, and bitter of tongue, no man was more generous in relieving distress or assisting struggling genius; and Sheridan, Moore, Campbell, and others, were all indebted

at different times to his generous liberality. He published in 1810 his poem of 'Columbus,' which was severely handled by the 'Quarterly Review,' and met with little success. 'Jacqueline, a Tale,' appeared in 1814, in the same volume with Lord Byron's 'Lara.' The same year he visited Paris, extending his tour to Italy, and remained abroad for several years. On his return in 1819 he published the poem of 'Human Life,' and in 1822 appeared the first part of his 'Italy,' a series of poems descriptive of the scenery and antiquities of that country, and perhaps the finest of all his works. Continuations of it followed at successive periods, and a complete edition in 1830, beautifully illustrated by Prout, Stothard, and Turner, which, with an illustrated edition of his other poems, composes two 8vo volumes, and was issued at a large outlay to the author. It proved, however, a remunerative speculation. In 1850 Rogers was offered the laureateship, vacated by the death of Wordsworth, but declined the appointment, which was bestowed on Tennyson. His unique collection of works of art was disposed of by auction after his death. Rogers' long life saw many literary changes, from the times of Goldsmith and Johnson to those of Thackeray and Dickens. He was a kind of English "autocrat of the breakfast table"; famous for his anecdotes and bon-mots, and his discussions of politics and art. He was certainly a representative, though among the less prominent, of a brilliant period of English poetry; with him care and taste served for genius. A volume of his 'Table Talk' was published by Alexander Dyce (1860). Consult Clayden, 'Early Life of Samuel Rogers' (1887), and 'Rogers and His Contemporaries' (1889). The correspondence, journals, and memoirs of the earlier 19th century abound in references to him.

Rogers, William Augustus, American astronomer: b. Waterford, Conn., 13 Nov. 1832; d. Waterville, Maine, 1 March 1898. He was graduated from Brown University in 1857, engaged in teaching at Alfred University and in 1858 accepted its chair of mathematics and astronomy. In 1864-5 he served in the United States navy and in 1866-7 studied at Yale, but resumed his duties at Alfred after each interruption, and under his direction the observatory there was built and equipped. He was appointed assistant at the Harvard Observatory in 1870 and became assistant professor of astronomy in 1877. He accepted the chair of astronomy and physics at Colby University in 1886 and remained there until his death. His work at Harvard Observatory consisted of observing and mapping all the stars down to the 9th magnitude, in a narrow belt a trifle north of our zenith, a task which consumed 11 years in observations and 15 years for their reductions. He overcame the difficulty of finding micrometer spiderwebs suitable for his work by etching glass plates with hydrofluoric acid, an expedient which proved so successful that he furnished the government with the plates used by the expedition to observe the transit of Venus. He was an acknowledged authority on micrometrical work and established standards of measurement for practical mechanical work.

He was an active member of various scientific societies and published nearly 70 papers concerning his specialties. He also published, in the 'Annals of Harvard Observatory': 'Observations made with Meridian Circle, 1871-2'; 'Catalogue of 8,627 Stars Between 49° 50' and 50° 10' of North Declination, 1875'; 'Journal of Zone Observations During the Years 1875-1883'; etc.

Rogers, William Barton, American geologist and physicist: b. Philadelphia 7 Dec. 1804; d. Boston 30 May 1882. He was educated at William and Mary College, gave scientific lectures before the Maryland Institute in 1827, and in 1828 became professor of natural philosophy and chemistry in William and Mary College. From 1835 until his resignation in 1853 he was professor of natural philosophy in the University of Virginia. He added to the course mineralogy and geology; and organized and directed the Virginia geological survey until its discontinuance in 1842. During his occupancy of this chair he devoted much of his time to original researches in geology, chemistry, and physics. He was also a leading member of the Association of American Geologists and Naturalists (organized 1840), and to its 'Transactions' contributed important memoirs, including observations on the temperature of coal mines in eastern Virginia. In 1853 he removed to Boston, where he continued his researches and voluminous contributions to scientific journals of the United States and Europe, and in 1862 lectured before the Lowell Institute on "The Application of Science to the Arts." At the request of several citizens of Boston, he drew up in 1859 a scheme entitled "Object and Plan of an Institute of Technology," to include a society of arts, a museum of arts, and a school of industrial science. He then memorialized the State legislature, and at length obtained from the State a charter (1862), and the grant of a tract in the Back Bay district upon which to place the buildings of the institution. Chosen the first president of the Massachusetts Institute of Technology, he was made also professor of physics and geology, and in 1864 visited Europe for the purchase of scientific instruments and appliances. He organized the system of teaching which still in general obtains in the Institute, and whose leading feature was laboratory instruction not only in chemistry, but in physics, mechanics, and mining. He resigned his post as president in 1870, but resumed his duties from 1878 to 1881, when he was succeeded by Francis A. Walker (q.v.). In 1847 he presided at the meeting by which the Association of American Geologists and Naturalists was enlarged into the American Association for the Advancement of Science; was made president of the latter in 1875; was a corporate member of the National Academy of Sciences; became its president in 1878; and was a founder and the first president of the American Social Science Association. He has been characterized as one who had in a high degree "the faculty of presenting the claims of science on popular interest and respect with force and lucidity." His gifts of expression as speaker and writer were excellent. Many of his researches added materially to scientific knowledge. Among his books were

ROGERSVILLE—ROGUE MONEY

'The Strength of Materials' (1838); 'The Elements of Mechanical Philosophy' (1852); and 'Papers on the Geology of Virginia' (1884), comprising his yearly reports in 1836-40. Consult the 'Life and Letters,' published in 1897.

Rogersville, rōj'ēr-z-vīl, Tenn., village, county-seat of Hawkins County; on the Southern railroad; about 45 miles east-northeast of Knoxville. It is in a fertile valley, bordered by mountainous regions rich in variegated marble, and building stone, and having considerable coal. The chief manufacturing establishments are flour mills, furniture factories, and machine shops. A number of the villagers have employment in the marble quarries. The educational institutions are the McMinn Military Academy, and the Swift Memorial Institute. The latter was founded in 1848 by the Presbyterian Church. There are good public schools and two school libraries. The national bank has a capital of \$75,000. Pop. (1890) 1,153; (1900) 1,386.

Rogersville, Engagements at. On 5 Nov. 1863 Col. Israel Garrard, with the 7th Ohio cavalry, 2d Tennessee mounted infantry, and a battery of four guns, occupied Rogersville, Tenn., camping near the town. During the day Gen. W. E. Jones, with about 2,500 Confederate cavalry, crossed the Holston River near Kingsport, made a night march by roads badly guarded, and at daybreak of the 6th surprised and captured Garrard's outposts, and advanced towards his camp, attacking and routing the 7th Ohio, Garrard and a few of his men escaping to Morristown. Jones then attacked the Tennessee regiment, which made a good resistance, but was soon surrounded and obliged to surrender. The Union loss was about 20 killed and wounded, and 650 men, four guns, two colors, 1,000 horses and mules, and 40 wagons and ambulances captured. The Confederate loss, as reported, was 10 killed and wounded. News of the disaster caused a hasty retreat of the Union forces from Jonesboro and Greeneville to Bull's Gap, where it was learned that Jones had not advanced beyond Rogersville, and the retreat ended. At the same time Jones retreated in an opposite direction to the Virginia line.

On 21 Aug. 1864 Rogersville was held by a small force of Confederate cavalry, under Col. Watkins, which was attacked at daybreak by a detachment of the 13th Tennessee cavalry, under Lieut.-Col. Ingerton. Several Confederates were killed and wounded, and Watkins, with 25 of his men, captured, the remainder escaping to Kingsport. On 8 Oct. 1864 Gen. John C. Vaughn, having driven a Union force from Kingsport, followed it to Rogersville, and attacked with his brigade, killing 10 and wounding several Union troops, and driving the remainder to Bull's Gap. On 10 December Gen. A. C. Gillem, with a Union brigade, marched from Knoxville, on the 12th drove in the pickets of Gen. Duke's brigade, and followed to Big Creek, four miles from Rogersville, where the Confederates had taken a strong position. With a part of his command Gillem made a flank movement, charged with the other part, and drove the Confederates from position and through Rogersville, in the direction of Kingsport, where they were overtaken next day and

routed, with some loss. Consult: 'Official Records' Vols. XXXI., XXXIX., and XLV.

E. A. CARMAN.

Roget, rō-zhā', Peter Mark, English physician: b. London 18 Jan. 1779; d. Malvern, Worcestershire, 12 Sept. 1869. He was educated at the University of Edinburgh and was appointed physician to the Manchester Infirmary in 1804. In 1808 he removed to London, where he became physician to the Northern Dispensary. He was elected a fellow of the Royal Society in 1815 and for 20 years served as its secretary. He was professor of physiology at the Royal Institute in 1833-6, and in 1837 was active in the establishment of the University of London, in the senate of which he continued a member until his death. He retired from practice in 1840 and devoted himself to literature and to mechanics, for which he had decided talent. He wrote: 'Animal and Vegetable Physiology Considered with Reference to Natural Theology' (1834); 'Physiology and Phrenology' (1838); and the famous 'Thesaurus of English Words and Phrases' (1852).

Roggeveld (rōg'gē-vēld) Mountains, in Africa, in the southwestern division of Cape Colony, running northwest to southeast with an average height of 5,000 feet. They form a western continuation of the Nieuwveld Mountains.

Rogier, rō-zhē-ā, Charles Latour, Belgian statesman: b. St. Quentin 17 Aug. 1800; d. Brussels 27 May 1885. He was educated at the University of Liège and at the outbreak of the Belgian revolution in September 1830 became a revolutionary leader in Brussels. On 24 September he was made president of the administrative commission and later went as a delegate of the provisional government to Antwerp. After an armistice had been arranged with Holland, he exercised absolute power in the reorganization of the administration of the city. He represented Liège in the National Congress, voted to establish a hereditary monarchy, and proposed the adoption of the elective second chamber. He became governor of the province of Antwerp in 1831 and the next year minister of the interior. He retired in 1834 after having carried a law providing for the establishment in Belgium of the first railway in Europe. From 1834 to 1840 he was again governor of Antwerp; and leader of the Liberal party in opposition 1841-7. He became prime minister and minister of the interior in 1847 and by his energy and foresight Belgium escaped the revolutionary crisis that involved Europe in 1848. In 1850 he organized secondary education under control of the state; but retired from office in 1852. Again becoming prime minister in 1857 one of the first acts of his ministry was the fortification of Antwerp. In 1861 he became minister of foreign affairs and succeeded in freeing the navigation of the Scheldt, which fact contributed to make Antwerp one of the important ports of Europe. He retired from ministerial office in 1868, though he sat for Tournai until his death.

Rogue Money, the popular name for an assessment formerly levied on every county in Scotland "for defraying the charges of apprehending criminals, or subsisting them when apprehended, and of carrying on prosecutions against them." This tax was first imposed by

a statute of George I., on the assertion that criminals were in the habit of escaping punishment for lack of the funds necessary to bring them to justice. The freeholders in each shire were directed to fix the assessment at any of the head courts yearly, and to appoint collectors. By an act of Victoria rogue money in the shires was abolished, and in lieu thereof power was conferred on the Commissioners of Supply to levy by rate a "County General Assessment."

Rogue (rōg) **River Indians**, the name applied to a number of Indian tribes on Rogue River, southwestern Oregon, most of which belonged to the Athapaskan stock, but the members of the Takilman stock were also included. They were not friendly to the early settlers, and in 1853, with neighboring tribes, finally resented the continued encroachments on their lands by conducting a succession of massacres and outrages which continued until 1856, when they were compelled to submit to American troops and sent to Grande Ronde Reservation, where they remained until the spring of 1857 when they were finally established on Siletz Reservation. Here, with five other tribes, they now number 453.

Rohan, Henri de, ōñ-rē dē rō-āñ, DUKE OF, French general: b. Castle of Blain, Brittany, 21 Aug. 1579; d. Königsfeld 13 April 1638. In his 16th year he joined the court of Henry IV., whose childless marriage led him to entertain the hope that, as a very near relative, he might one day succeed him in Navarre, but in 1610 the assassination of the king dashed all his hopes. The opposing parties again flew to arms and Rohan placed himself at the head of the Calvinists. But Louis XIII. and Richelieu, the all-powerful minister, annihilated the political existence of the Huguenots. Rohan then withdrew from his native land, and in exile wrote '*Mémoires sur les Choses advenues en France depuis la Mort de Henri IV.*' (1630). In the wars of Venice against Austria he commanded the troops of the republic till the Peace of Cherasco in 1631. Later he went to Geneva, where he composed his '*Mémoires et Lettres sur la Guerre de la Valteline*' (1638). In Germany the Roman Catholic league had made war against the Protestants, and Rohan in 1638 joined Bernard of Weimar, then commanding the Protestant army on the Rhine. He was wounded at the battle of Rheinfelden, 28 Feb. 1638, and his death followed shortly afterward. Besides the works mentioned above he wrote '*De l'Intérêt des Princes et Etats de la Chrétienté*' (1638).

Rohan, Louis René Edouard, PRINCE DE. See DIAMOND NECKLACE.

Rohilkhand, rō-hīl-kūñd' or -kāñd', or **Rohilkund**, India, a division of the United Provinces of Agra and Oudh, bounded north by the Himalayas, separating it from Kumaon, west and southwest by the Ganges, and east and southeast by Oudh; area, 10,885 square miles. The surface is a plain, with a gradual slope south, in which direction its principal streams, Ramganga, Dooha, and others, flow. Its north frontier is occupied by an extensive forest; elsewhere palms, the sugarcane, cotton, and the finer fruits of the temperate zone flourish. It

takes its name from the Rohillas, an Afghan tribe, who gained possession early in the 18th century. The division is subdivided into the districts Bijnur, Muradabad, Budaon, Bareilly, Terai, and Shahjahanpur. It encloses the native principality of Rampur. Pop. of division, 5,343,674.

Rohlfs, rōlfs, Anna Katharine Green, American novelist: b. Brooklyn, N. Y., 11 Nov. 1846. She was graduated from Ripley College (Poultney, Vt.), in 1867, and in 1884 was married to Charles Rohlfs. In 1878 she won a great success with '*The Leavenworth Case*,' a detective story with an ingenious and well-elaborated plot. With the exception of a dramatic poem, '*The Defence of the Bride*' (1882), and a drama, '*Rifisi's Daughter*' (1887), her other works follow similar lines. Among the titles are: '*A Strange Disappearance*' (1879); '*The Mill Mystery*' (1886); '*7 to 12*' (1887); '*A Matter of Millions*' (1890); '*Marked Personal*' (1893); '*Dr. Izard*' (1895); '*That Affair Next Door*' (1897); '*The Circular Study*'; '*The Filigree Ball*' (1903); '*The Millionaire Baby*,' and '*The House in the Mist*' (1904).

Rohlfs, Friedrich Gerhard, German African traveler: b. Vegesack, Germany, 14 April 1831; d. Goderburg, Prussia, 3 June 1896. He was educated at Heidelberg and Göttingen and in 1855-60 served as a surgeon in the French army at Algiers. He traveled through Morocco in 1860 and in 1862 explored the Taflet Oasis. He traveled in North Africa in 1863 and in 1865, joined the English expedition to Abyssinia in 1867, and in 1868 traveled in Cyrenaica. He conducted an expedition through the Libyan Desert in 1873-4, traveled in North America in 1875-6, and in 1878 again visited Africa, penetrating to the Kufra Oasis. He traveled in Abyssinia in 1880 and in 1884-5 acted as German consul at Zanzibar. He wrote: '*Journey through Morocco*' (1869); '*Across Africa*' (1874-5); '*My Mission to Abyssinia*' (1883); '*What News from Africa*' (1887); etc.

Rojas y Zorrilla, rō'hās ē thōr-rēl'yā, Francisco de, Spanish dramatist: b. Toledo, Spain, 4 Oct. 1607; d. about 1680. Information concerning his life is of a fragmentary character and he is frequently confused with several other persons of the same name. He seems to have studied at the universities of Toledo and Salamanca and his work had become famous by 1632, as Montalván mentions him in high terms in his '*Para Todos*' of that year. There was a rumor that he had been assassinated in 1638 but it was clearly unfounded, as in 1644 he was honored with the mantle of the Order of Santiago, an evidence of favor at court. He was author of numerous plays and sacred pieces, but took no pains to preserve his works and many of them have been lost, though he did publish two '*Parts*' of his dramas (1640-5) and announced a third which never appeared. Among the best of his remaining works are: '*Del Reyabajo ninguno*'; '*Entre bobos anda el juego*'; '*Lo que son mujeres*'; '*Casarse por vengarse*.' No complete edition of his remaining works has been published, but an excellent selection is given in Rivadeneyra's '*Biblioteca de Autores Españoles*' (Vol. LIV., 1866).

Rokitansky, rō-kē-tān'skē, **Karl**, BARON von, Bohemian anatomist: b. Königgrätz 19 Feb. 1804; d. Vienna 23 July 1878. He studied at Prague and Vienna; became professor of pathological anatomy at the University of Vienna in 1834, and continued there until 1875. His great work, 'Handbuch der pathologischen Anatomie' (1842-6), stands as the foundation of the science of pathological anatomy. It was translated by order of the Sydenham Society in 1849-52. In 1869 Rokitansky became president of the Austrian Academy of Sciences.

Roland, Jean Marie de la Platière, zhōn mā-rē dē lā plā-tē-ār rō-lān, French patriot: b. Thizy (Beaujolais) 18 Feb. 1734; d. Rouen 15 Nov. 1793. From a humble position in the mercantile world, he rose to eminence in the city of Amiens, in which he held the office of inspector of manufactures. His interests, however, were not in trade, and his views upon political economy and the great problems of government brought him into the ranks of the philosophers of his day. In 1780 he married Manon Jeanne Philpon, whose share in the Revolution was even greater than his own. At the outbreak of the Revolution he joined the Moderate Republican party, during whose brief rule he was made minister of the interior. This position he held from March until June 1792, when the Girondists were forced to retire. After the conflict in Paris 10 August, Roland was recalled, but the Jacobin spirit was too strong, and he was forced to flee. Upon hearing of the death of his wife he took his own life. Consult Lamartine, 'Histoire des Girondins' (1847: English translation by Ryde).

Roland, Manon Jeanne Philpon, wife of Jean Marie Roland (q.v.): b. Paris 17 March 1754; d. there 9 Nov. 1793. With a mind bent upon interests far beyond her years from earliest childhood. Mademoiselle Philpon, the daughter of a Paris engraver, developed at 19 remarkable talents, and at 24 into a woman of great brilliancy of intellect, a disciple of Rousseau, the emancipation of the common people her creed, and their deliverers, the philosophers and patriots of France, her friends and counsellors. In 1779 she was married to M. Roland, with whose political fortunes her life was thenceforth bound. Her faith in the outcome of the Revolution was that of a devotee, her enthusiasm the inspiration of a great party. At first the friends and confidants of Robespierre and those who were afterward leaders of the Jacobin element, the Rolands became the defenders of the more moderate republican idea, and were among the greatest martyrs to this cause. On the fall of the Girondists in the summer of 1793, Madame Roland was arrested, and on the 9th of November was guillotined. During her imprisonment she wrote her famous 'Mémoires,' which were afterward published, together with her correspondence with the other leaders of the French Revolution. Consult: Lamartine, 'Histoire des Girondins,' English translation by Ryde (1849); 'Correspondence de Madame Roland,' edited by C. Perroud (1901); Tarbell, 'Life of Madame Roland' (1896).

Roland, rō'land (Italian, ORLANDO), hero of romance and one of the paladins of Charle-

magne, of whom he is represented as the nephew. His character is that of a brave, unsuspicious, and loyal warrior, but somewhat simple in his disposition. According to the 'Song of Roland' (11th century) which forms part of the 'Chansons de Geste,' Charlemagne, after a six years' stay in Spain, resolved to return home. By the advice of Roland the emperor sent Ganelon to Saragossa to receive the homage of the Saracen king Marsilius. This mission had been fatal to all who had been formerly sent on it, and Ganelon, to revenge himself on Roland, betrayed to Marsilius the line of march of the Christian army. Marsilius collects an immense host, allows Charlemagne to cross the Pyrenees with the main body of his force, and falls upon the rear-guard commanded by Roland (778). A desperate struggle ensued; 100,000 infidels fell, and Roland had only 50 remaining of the 20,000 warriors whom he had led into the narrow pass of Roncesvalles (Roncevaux). Another pagan army hastens up. Seeing himself now fairly overpowered Roland at last sounds his enchanted horn, which is heard beyond the mountains by the emperor. The traitor Ganelon, however, deceives Charlemagne with the assurance that Roland is only engaged on a deer hunt. Thrice the sound of the ivory horn is heard and unanswered, but another blast, the violence of which cracked Roland's temples, alarmed the emperor for the safety of his favorite warrior. He hurries up to his assistance, but it is too late; Roland, wounded in many places, has dragged himself to die at the foot of a tree, has sung his death song and thrown down his enchanted sword, Durandal, and the ivory horn, and covered them with his body. Nothing remains but to avenge the death of the hero, and this Charlemagne does in a series of bloody victories, with the narration of which the poem closes. The poems of Pulci, 'Morgante Maggiore'; of Boiardo, 'Orlando Innamorato'; and Ariosto, 'Orlando Furioso,' relate to Roland and his exploits. Consult: Einhard, 'Vita Caroli Magni'; Turpin, 'De Vita Caroli Magni et Rolandi'; Schmidt, 'Ueber die italienischen Heldengeschichten aus dem Sagenkreis Karls des Grossen' (1820).

Rolfe, rōlf, **William James**, American Shakespearian scholar: b. Newburyport, Mass., 10 Dec. 1827. He was educated at Amherst College, and after teaching in Wrentham, Mass., became master of the high school, Dorchester, Mass., in 1852. In 1857 he was master of the high school at Lawrence, Mass., in 1861 of the high school at Salem, Mass., and from 1866 to 1868 of the high school at Cambridge, Mass., resigning in the year last named to devote himself to literary pursuits. His Shakespearian labors began in 1867 with his editorship (with J. H. Hanson) of Craik's 'English of Shakespeare.' In 1870 he issued an annotated edition of 'The Merchant of Venice' and followed this with other annotated plays till in 1883 a complete edition of Shakespeare had appeared in 40 volumes. This is sometimes styled 'The Friendly Edition,' a name first suggested by Mary Cowden-Clarke (q.v.). He has also edited 'Select Poems of Goldsmith' (1875); Gray (1876); Browning (1887); and Wordsworth (1889); a complete edition of Scott

(1887); and of Tennyson (1895-8), and other works, and is the author of 'Satchel Guide to Europe,' revised yearly (1872-1903); 'Shakespeare the Boy' (1896); 'Life of Shakespeare' (1902). He has lectured much upon Shakespeare and literature in general and in his editions of Shakespeare and other poets has admirably preserved the balance between textual and literary criticism.

Roll, rôl, Alfred Philippe, French painter: b. Paris 10 March 1847. From being a designer of patterns and decorations of various sorts he passed to the Ecole des Beaux Arts at Paris, where he was much attracted to the work of Jerome and Bonnat. The influence of both these teachers is traceable in his pictures, especially that of Bonnat in the duskiness of coloring which prevails in his 'Scenes from the Flood at Toulouse in June 1877,' a picture which gained a medal of the first class, and is now in the Havre Museum. In succeeding pictures he developed a passion for naturalism of the most uncompromising character, and in his 'Feast of Silenus' (1878) (in the Museum of Ghent), and still more in the 'Strike of the Colliers' (1880), now in the gallery of Valenciennes, and 'Labor' (a representation of masons, bricklayers, and carpenters at work on a building), this tendency is conspicuous. These are all blazing sunlight pictures, as if executed *en plein air*, and in like style are his subsequent works whether portraits, genre-groups, landscapes, or marines. They are solidly painted with a matter-of-fact air of reality which is very striking. Among his later works is a canvas crowded with figures, 'The Centennial Jubilee of the Revolution of 1789' (1893).

Rolla, Alessandro, Italian violinist and composer: b. Pavia 22 April 1757; d. Milan 15 Sept. 1841. He was active for many years as musical director at La Scala theatre and teacher in the Conservatory in Milan, and published several quartet and solo pieces as well for the violin as for the bass viol, which for essential purity of composition and perfection of form stand preeminently superior to similar works of his day.

Rolla, rôl'a, Mo., city, county-seat of Phelps County; on the Saint Louis and S. F. railroad; about 48 miles south-southeast of Jefferson City, and 110 miles southwest of Saint Louis. It is in an agricultural and iron mining region. Its chief industrial establishments are smelting furnaces, foundries, machine shops, flour and grist mills. It is the seat of the Missouri School of Mines and Metallurgy, a department of the Missouri State University (q.v.), organized in 1871. Pop. (1890) 1,592; (1900) 1,600.

Roller, a tropical bird of the genus *Coracias*, forming the type of the family *Coraciidae*. These birds are generally of small size, and frequently exhibit brilliant colors in their plumage, and are confined in their distribution to the eastern hemisphere. The food consists partly of insects and partly of nuts and fruits. The common roller (*Coracias garrula*) is found in Africa, whence it migrates in summer northward into Europe. In size the roller equals the common jay. The back is of a light brown color. The head is bluish-green, as also are the neck and lower surfaces. The lesser coverts of the

wings are bright blue; the tail-feathers blue, with a greenish lustre. The voice is noisy and harsh. In habits these birds are shy, and frequent forest depths and secluded spots. The four pure white eggs are frequently deposited in the holes of trees or in holes in river banks. The genus *Eurystomus* is nearly similar to *Coracias*, but occupies tropical Africa. Both genera include several distinct species. Consult Evans, 'Birds' (1900).

Roller Skate, a skate patented in France as early as 1819. Since that time scarcely a year has passed without the recording of some improvement in wheel skates. Plimpton's improvement consisted in so gearing two pairs of wheels that they would "cramp" when the foot-plate was canted to either side, and thus cause the skate to move on a curved line. Several years elapsed before the value of the invention was generally recognized; but in the meantime the inventor was busy making improvements and taking out other patents and in 1874 had brought the skate practically to its present condition. This device of "cramping" the wheels secured the initial success of roller skating. The earlier inventions were crude affairs compared with the modern appliances; the present roller skate combines strength, lightness, and ease of action in a marked degree. About 1864 the mania for roller skating appeared in England; but in 1866 the "rinking" fever broke out in Australia, and spread thence to England and the United States. Since that time the craze has appeared at intervals only to again die out. The most recent of these arose in 1884-5 in the United States, but soon shared the fate of its predecessors. The most recent form has only two wheels, set one behind the other, and resembling the ice skate in its form and action.

Rollin, rô-lân, Ambrose Lucien, West Indian historian: b. Trois Rivières, Guadeloupe, 1692; d. Point à Pitre, Guadeloupe, 1749. He was appointed deputy-lieutenant of the colony in 1725, an office which he occupied until his death, and devoted himself in his leisure to researches upon the Caribes and other Indian tribes. His works show remarkable care and ability and are still accepted as authoritative. They include: 'Histoire des Indiens' (1739); 'Histoire et Description des Caraïbes, leur Condition avant la Conquête' (1734); 'Les Incas du Pérou et la Conquête Espagnole' (1738); etc.

Rollin, Charles, French historian: b. Paris 30 Jan. 1661; d. there 14 Sept. 1741. He studied theology at the Sorbonne, but did not take orders. In 1688 he obtained the chair of eloquence in the Collège de France, of which he became rector in 1694, and he there revived the study of Greek language. In 1696 he was chosen coadjutor or head of the College of Beauvais. Displaced in consequence of his connection with the Jansenists, he was reinstated in 1720. His productions are 'Traité des Etudes' (1726-31); 'Histoire Ancienne' (1730 and 1738), his best known work; and 'Histoire Romaine' (1738-48) to the war against the Cimbri (completed by Crevier and others). Rollin's writings are distinguished for purity and elegance of style, but are diffuse and prolix, and his historical works are deficient in critical sagacity. There is an edition of his works in 30 vols. (1827), with notes on the historical parts by Guizot. His 'Ancient His-

tory' has been often reprinted in English, but is now quite out of date.

Rollin, Ledru. See LEDRU-ROLLIN.

Rolling Mills are machines employed to convert masses of metal into bars or plates, and consist of a series of rollers in pairs, variously arranged, between which the metal is passed and receives successive reductions in thickness and a consequent increase in length or breadth, as the case may be. The rollers are made of steel, and are mounted on massive frames capable of withstanding enormous strains. They have plain or grooved surfaces according to the purposes for which they are employed, and are driven by powerful horizontal reversing steam-engines, by cog-wheel connections and axle gearing. Of the many purposes for which they are employed, perhaps the most important is the manufacture of rails, bridge work and other structural shapes, pipes or tubes, wire, and plates of various kinds such as armor plate, boiler plate, etc. (See PIPE, MANUFACTURE OF.) In the manufacture of rails, the ingot of cast metal is placed in the soaking pit and heated to a white heat. It is then taken to the blooming mill and passed through the blooming rolls seven times and reduced to a bar of a section 9 inches square, and 15 feet long which is subsequently sheared into two or three pieces, according to the length of the desired rail. These pieces called "blooms" are then heated in the bloom furnaces from which they are taken to the rail mill, which consists of a series of grooved rollers arranged in three sets—the roughing rolls, the intermediate rolls, and the finishing rolls. These rolls are placed one beyond the other and extend over an interval of about 900 feet. The hot blooms are passed through them successively. Through the roughing mill the bloom is passed five times and reduced approximately to the section of the desired rail. It is then passed through the intermediate rolls five times and brought still closer to the desired section. It is now placed upon a cooling table for a period of time ranging from 45 to 90 seconds, depending upon the weight per pound of the rail, and then passed through the finishing rolls and brought to the exact section required. After leaving the finishing rolls the rails are cut up into lengths of 30 or 60 feet, as required, then passed through the cambering rolls where they receive sufficient camber to insure of their remaining true and straight when cooled. Rail rolling mills have a capacity of turning out from 7,000 to 8,000 rails per day, requiring about 3,000 tons of metal. (See RAILS, MANUFACTURE OF.) In the manufacture of bridge and other structural shapes, a brief description of the rolling mills of the Pencoyd Iron Works, Pencoyd, Pa., will serve to indicate their enormous capacity. The output of their open-hearth department amounts to 46,000 tons of ingots per week. This mass of metal is converted into finished shapes by a plant of five mills—a 23-inch, three-high roll train, for rolling shapes; a 12-inch, three-high roll train, for rolling angle and T irons; a 28-inch, two-high reversing roughing mill; a 36-inch, two-high preparing mill; and a 23-inch, three-high finishing mill; each of which is driven by 30 x 36-inch double reversing engines geared directly to the mills. For use of rolling mills in wire-making, see WIRE, MANUFACTURE OF.

Rollins, rōl'inz, Frank West, American politician: b. Concord, N. H., 24 Feb. 1860. He was graduated from the Massachusetts Institute of Technology in 1881 and later attended the Harvard Law School. After a brief practice of the law, he became a banker in Boston. In 1884 he was elected to the New Hampshire Senate, and in 1898 was elected governor of that State. In this capacity he served two years. The idea of "Old Home Week," established in New Hampshire during his administration, and adopted by many of the older States, originated with Governor Rollins. He has published 'The Ring in the Cliff' (1877); 'Break o' Day Tales' (1895); 'The Lady of the Violets' (1898); 'Old Home Week Speeches' (1900); etc.

Rollins College, located at Winter Park, Fla.; established in 1885. It is not under direct denominational control, but is closely affiliated with the Congregationalists. It has a collegiate and preparatory department, the former conferring the degree of bachelor of arts. It is co-educational, and the number of women in attendance usually nearly equals the number of men. The grounds and buildings in 1903 were valued at about \$90,000; the library contained 4,000 volumes; the annual income was over \$3,200. The students numbered 200 in both departments, and the faculty 20.

Rollo, rōl'ō, Norwegian conqueror of Normandy: d. 930. According to tradition he was named "Walking Rolf" (Ganger Rolf), because no steed could carry him. He fought for several years in France, and finally made peace in 912, receiving from Charles the Simple for himself and his freebooting followers a tract along the Seine between the Eure and Epte. He became a Christian, was baptized at Rouen, and took the title Duke Robert. See NORMANS.

Romagnosi, rō-mān-yō'sē, Giovanni Domenico, Italian jurist and philosopher: b. Salso Maggiore, Italy, 13 Dec. 1761; d. Corfu 8 June 1835. He was educated at Pavia and established himself as an advocate at Trent. He was appointed professor of law at Parma in 1803 and in 1806 went to Milan to assist in preparing a code of penal procedure which was later adopted. A chair of law was established expressly for him at Milan, but after the downfall of Napoleon he lost his position. He continued to lecture until 1817 and in 1818 was tried for treason but acquitted. He subsequently supported himself by giving private lessons and continued in abject poverty until his death. Among his works are: 'La genesi del diritto penale' (1791); 'Introduzione allo studio del diritto pubblico universale' (2 vols. 1805); etc. Complete editions of his works were published in 19 volumes (1832-5) and in 15 volumes (1836-45).

Romaine, rō-mān', William, English Anglican divine: b. Hartlepool, England, 25 Sept. 1714; d. London 26 July 1795. He was educated at Oxford, held several small curacies prior to 1748 when he went to London to hold a lectureship at the united parishes of St. George's, Botolph Lane and St. Botolph's, Billingsgate. In

1749 he became attached to St. Dunstan's-in-the West and the next year became morning preacher at St. George's, Hanover Square. He was a follower of Whitefield, an ardent evangelical, and suffered much persecution in and out of the church for his views, and on account of the congregations of the poor that he assembled. As a consequence he lost his appointments and held others but for a brief period until 1764, when he was inducted to St. Ann's Blackfriars, and was elected by the parishioners to St. Andrew of the Wardrobe. This election, though disputed, was confirmed by the court of chancery and he held the pulpit until his death. He published: 'The Life of Faith' (1763); 'The Walk of Faith' (1771); 'The Triumph of Faith' (1794).

Roman and Greek Gods. The following are among the more prominent gods in Roman and Greek mythology:

| Gods | Greek | Roman |
|----------------------------|-------------|-------------|
| King of Gods..... | Zeus. | Jupiter. |
| God of Water..... | Poseidon. | Neptune. |
| God of the Lower Regions. | Pluto. | Pluto. |
| Messenger of the Gods.... | Hermes. | Mercury. |
| God of War..... | Ares. | Mars. |
| The Gods' Smith..... | Hephestos. | Vulcan. |
| God of Light..... | Apollon. | Apollo. |
| Goddess of Hunting..... | Artemis. | Diana. |
| Goddess of Wisdom..... | Athene. | Minerva. |
| Queen of Heaven..... | Hera. | Juno. |
| Goddess of Tillage..... | Demeter. | Ceres. |
| Goddess of the Hearth.... | Hestia. | Vesta. |
| Goddess of Beauty..... | Aphrodite. | Venus. |
| God of Wine..... | Dionysos. | Bacchus. |
| God of Love..... | Eros. | Cupid. |
| God of Time..... | Chronos. | Saturn. |
| Wife of Chronos..... | Rhea. | Cybele. |
| Queen of Hades..... | Persephone. | Proserpina. |
| Goddess of the Rainbows.. | Iris. | Iris. |
| Cup-bearer to the Gods.... | Hebe. | Hebe. |

Roman Catacombs. The "Catacombs of Rome" is the name given to the underground cemeteries, in which were laid to rest the Christians of the Eternal City during the first four centuries. The word itself seems to be a hybrid from the Greek *κατα* and the Latin *cum-bere*, and signifies "next the sepulchres." It first came into use at the end of the 3d century as a topographical term for a point of the Appian Way. In the course of time it was applied to the adjoining cemetery of Saint Sebastian, and in the Middle Ages when the other cemeteries were forgotten, it became a general designation for all the early Christian burial-places at Rome. It was a word unknown, however, to the first followers of Christ, who called the sepulchres of the saints, cemeteries, "places of sleep," owing to their faith in the Resurrection. There are some 32 of these larger early Christian cemeteries beyond the Aurelian wall, bordering the ancient Roman roads and encircling the city of the living with a silent city of the dead. The most important are the Catacombs of Priscilla on the Via

Salaria, of Calixtus on the Via Appia, of Domitilla on the Ardeatina, and the Ostrinam on the Via Nomentana. In this Roma Sotteranea there are some 550 miles of underground corridors, honeycombing the soil of the deserted Campagna, and running like streets in all directions and at every angle, now near the surface and again descending to the depth of 75 feet, expanding here into a room and there into a crypt or chapel, along whose sides the faithful were buried in rows one above the other, like the shelves of a shop, or the bunks of a vessel. The corridors average about three feet in width and six feet in height, and were dug generally in three or four levels, ranging from 30 to 50 feet below the surface of the soil. The niches, called *loci*, or *loculi*, which contained the bodies, were closed by a marble slab or a series of tiles, on which was frequently carved some inscription. To understand the origin of the Catacombs, it is necessary to keep before our minds, (1) the funeral customs and laws of Imperial Rome; (2) the early Christian mode of burial; and (3) the nature of the soil out of which sprung the famous seven hills. (1) The ancient Romans had a great reverence for their dead. *Religiosum locum unus quisque sua voluntate facit, dum mortuum infert in loco suo.* Wherever a body rested became *terra sancta*, sacred soil, subject to the authority of the pagan pontiffs. Hence burials were forbidden inside the walls, and the ways leading out of the city were lined from the first to the third milestone with the mausolea, whose richness was one of the glories of the Imperial City, as their ruins are one of the beauties of modern Rome. The pagan mausoleum consisted of three parts, the monument proper, the area or lot of ground, and the underground vault in which the ashes were placed in dovecot niches, known as *columbaria*. These burial plots with their magnificent monuments were owned by burial societies as well as by families, and were fully protected by the law. The Christians likewise, either singly or collectively, erected their mausolea along the highways beyond the walls, and this property, even in times of persecution, was safeguarded by the majesty of Roman law. Hence it often happened that while the law spilled the blood, it spared the body of the Christian. The opinion sometime current that the bodies of the martyrs were buried by stealth, and that the pagan authorities were ignorant of the existence and extent of the Catacombs, is altogether unfounded. The Catacombs were registered under and recognized by the law. They enjoyed the privilege of sacrosanct soil. Indeed many of the bodies were interred in surface cemeteries as to-day. (2) The first faithful originated no special mode of burial. They generally followed the customs of the people among whom they lived. They adopted the Jewish practice of interring, instead of the Roman method of cremating, on account of their belief in the resurrection of the flesh. The sepulchre hewn in the rock, where the body of Christ was laid, was the resting place too of the Christian body. This was first wrapped in a tunic or winding sheet previously coated with a preparation of plaster, was covered with perfumes and flowers, and placed in one of

the niches cut out of the subterranean crypt or along the corridor. In the case of the martyrs or wealthier converts the bodies were laid sometimes in a marble sarcophagus or in an arched grave hewn out of the rock, termed *arcosolium*, and called *bisomus* or *trisomus*; according to number of bodies it contained.

(3) The soil of the Roman Campagna is of volcanic origin, and consists of three distinct sorts of tufa; (1) the lithoid tufa or peperino, a hard building stone; (2) the fine pozzalana sand used in making the Roman cement; (3) a granular tufa, of no commercial value. However this granular tufa was readily worked, and it is precisely in this strata that we find the Catacombs. The workmen followed these veins in excavating, thence the apparent confusion of the courses and distance of the depths. It was thought at one time that the Catacombs, like the *arenaria*, were excavated for building purposes, but modern research has shown that they are of distinctively Christian origin, and have nothing in common with the *arenaria* either in mode or material of construction.

Origin.—The genesis of the grave among the faithful at Rome was something like this. The wealthier Christians owned their burial lots along the public roads leading out of the city. They had their monument fronting the way, marked with the name of the family. Thus for instance was the case with "Sepulchrum Flavium" on the Ardeatine Way. The crypt beneath instead of being fashioned into a columbarium, had the graves cut out of the soil. At first this crypt was placed at the disposal of the brethren of the *Ecclesia Fratrum*, and as the number of burials increased, the crypt was gradually extended under the entire surface of the lot. Thus the Catacombs in the first and second centuries were little more than the private burial vaults of the wealthier Christian converts. These original centres of excavation have been recognized in many cases, as for instance, the crypt of Lucina in Calixtus, the Greek Chapel in Priscilla, and the *Spelunca magna* in Prætextatus. At the beginning of the 3d century, the cemeteries passed from private to Pontifical control. About the year 197, Zephyrinus appointed the deacon Calixtus to take them in charge, and the latter has bequeathed his name to the best known of them, which became the official burying place of the Bishops of Rome in the 3d century, and contains the famous papal crypt. Henceforth the Catacombs were owned and administered by the Church. Each one of the 25 parishes in which Ecclesiastical Rome was divided in the 3d and 4th centuries had, roughly speaking, its corresponding cemetery. The identification of the *tituli* and the cemeteries has been established in a number of instances. With the increasing number of the faithful were formed burial societies among the brethren, which, like the pagan societies, provided by the payment of dues for the benefits of burial to deceased members. They owned their own lots, had their own houses built above the ground, in which they met to celebrate their agape and funeral feasts. Hence there was nothing incongruous in the Christians assembling at the Catacombs on stated occasions to

keep the anniversary feasts of their martyrs. Similar celebrations were held by the pagans themselves, and there is a striking resemblance between the liturgy of these pagan funeral feasts and the language of the Roman martyrology. The inviolability of the cemeteries was undisturbed even in times of persecution, save by Valerian, in 258, and Diocletian, in 303. The part played by these burial societies in the Church is still in dispute. De Rossi has advanced the theory that the Church in the 3d century owned its property as a burial society, as *Ecclesia Fratrum* or *Ecclesia Cultorum Verbi*. Duchesne, however, contends that even in period of persecution, the Church was recognized as a religious society, capable of holding property. The work of excavating was under the care of a distinct class, called *fossores* or diggers. They were regarded as an inferior sort of clergy, and many of the rude inscriptions were made by them.

The Constantine Period.—It has often been said that the victory of Constantine brought the Church from the Catacombs to the Cathedral. The reverse is literally true. It was precisely in the era of peace, that the Church betook itself to the Catacombs, and that they attained their largest growth and grandeur. Everyone wished to be buried close to the martyrs of Christ. *Quod multi cupiunt et rari accipiunt*, we read in an inscription of the year 381, of one who had obtained burial near the sepulchre of the saints. The crypts of the martyrs were changed into triumphal halls of fame. They were decorated with the choicest of marbles from the wealth of the Imperial City. New corridors and entrances were cut, the old ones were joined together. Metrical hymns of praise were placed above the graves of the chief martyrs, especially by Pope Damasus. Lights were kept burning before their shrines, and thither the devout of the city were continually flocking to implore the intercession of the saints or to honor their memory. Even the great Constantine basilicas of Saint Peter on the Vatican, Saint Lawrence on the Labicana, Saint Paul on the Ostian, Saint Agnes on the Nomentana, were but triumphal canopies erected over the tombs of these Christian heroes. Toward the end of the 4th century the custom of burying in the surface cemeteries began to prevail, and after the sack of Rome by Alaric, in 410, interment in the Catacombs ceased altogether.

Period of Decline.—In the succeeding centuries they were chiefly centres of devotion and terms of pious pilgrimages from the North. The itineraries of these pilgrimages from England and Germany, some of which have been preserved, were veritable Ariadne-clues in the rediscovery of these buried labyrinths. For some time the Popes of Rome, notably Vigilius (537-555), John III. (561-574), and Honorius I. (625-638), kept the shrines in a state of repair; but after the ravages wrought in the Catacombs by the invading Lombards, Paul I. in 757 and Paschal I. in 817, translated the relics of the martyrs to churches within the walls. Despoiled of the treasures which had attracted visitors, they rapidly fell into decay. With the exception of the Catacomb of Saint Valentinian on the Flaminian, and Saint Sebastian on

ROMAN CATACOMBS

the Appian way, their very existence passed out of the minds of men in the Middle Ages.

Rediscovery and Research.—In 1587 some workmen, excavating on the Via Salaria, chanced upon a Catacomb corridor, rich in paintings and inscriptions. The interest aroused by this discovery has never since died out. Antonio Bosio (1576-1614), the Columbus of the Catacombs, devoted his life to their exploration. His 'Roma Sotterranea' is the first classic on the Catacombs. The researches made by Boldetti and Battari and others in the 18th century were mainly in the interest of controversy. To the Jesuit, Fr. Marchi, belongs the glory of having inaugurated, in 1841, a strictly scientific study of these early monuments and memorials, and the still greater glory of being the Master of Giovanni Battista de Rossi (q.v.), the father and founder of the science of Christian archæology. By his genius and labors he explored and excavated the buried crypts and corridors of the Catacombs, established their identity and called them by name. From broken stone and damaged fresco and forgotten tomb, he gathered together the materials of a monumental Encyclopædia Romana, a storehouse of the treasures of early Christian belief and behavior.

Paintings.—In regard to the many paintings found in the Catacombs, it may be said in general, that the history of the decline of Classic is that of the beginning of Christian art. In fact nearly all the examples extant of Roman paintings in the 2d, 3d, and 4th centuries are in the Catacombs. They show us that the Church baptised the art as well as the language of the Græco-Roman world. While the themes treated for the most part have a direct reference to the grave and beyond, they still illustrate a large part of the creed of the early church. The Catacomb frescoes belong to three distinct periods. In the first and beginning of 2d century, there was properly speaking no Christian art. The methods and motifs of the pagan painter, such as abound at Pompeii, vines, garlands, flowers, fishes, fruits, birds, cupids, etc., appear likewise in the Catacombs. However even among these designs, those that were capable of symbolizing some Christian truth, as the vine, peacock, dove, and fish, predominate. In the 2d and 3d centuries, as the cemeteries pass from private to public control, a series of paintings distinctly Christian begin to appear. They are symbolical in meaning and similar in execution.

In the third epoch which corresponds to the time of peace, the pictures tend to become more and more realistic, until they are petrified in the 5th and following centuries in the rigid forms of Byzantine art.

The Biblical Cycle.—A remarkable parallel between the prayers of the Roman Breviary for the commendation of the soul in the hour of death and the Biblical Cycle of cemeterial paintings, was first pointed out by Le Blant. This correspondence is so exact as to leave little doubt that these paintings derive their inspiration from the funeral liturgies of the Church. The deliverance of Noah in the flood, of Isaac from the sacrificing hand of his father, of Daniel from the lions' den, of the three children from the fiery furnace, of Susannah

from her false accusers, of Jonah from the whale, are the ever repeated themes, and they all correspond to the liturgical prayers for the dying. The raising of Lazarus completes the Biblical Cycle, and this scene is the gospel for the Requiem Mass. Of this series Jonas and Lazarus are most frequently depicted. The designs are evidently symbolic. A man standing in a chest serves to recall Noah and the ark; the story of Jonah is often told in three scenes; the casting from the ship, the vomiting forth from the dragon fish, and the resting under the gourd. But not infrequently the last scene alone is portrayed. In the same spirit the raising of Lazarus is depicted by a man standing upright at the entrance of a tomb.

Pictures of the Saviour.—There is no likeness of Christ attempted in the Catacombs. He is represented by the symbol of the fish and the hidden cross. The fish, in Greek, *ἰχθύς* formed the famous acrostic *Ἰησοῦς Χριστός, Θεοῦ Υἱὸς Σωτήρ* (Jesus Christ Son of God Saviour) and whether written or pictured was a mystic symbol of the Saviour. The transcribed dolphin in Calixtus is the earliest copy of the Crucifixion. The disguised cross was also of frequent use, and never has this sign been in higher esteem than the first ages of the Church. It was sometimes represented thus χ ; again as an anchor \dagger , now as the gamma cross Γ , at other times as a trident Ψ . The Constantine monogram χ , so called from its use on the Labarum, was the common symbol of the 4th century. It was used even in inscriptions, as *in nomine* χ or *in pace* χ . This χ was the early monogram of Christ, as IHS became the later one, of Jesus. There was no real representation of the Crucifixion till the Middle Ages. The Crucifix is the creation of the ages of faith, and not of the formative period of Christianity. The first pictures in the Catacombs represent Christ as young and beardless, but in the 5th century the Byzantine bearded face with severe features came into vogue. The picture of the Good Shepherd is the Catacomb Christ par excellence. It is found everywhere in the frescoes of the 2d, 3d, and early 4th centuries. The Saviour is represented in the garb of a young Roman shepherd, wearing the short sleeveless tunic, his right shoulder bare, his feet and legs sometimes bare, again covered with shoes and leggings. In some scenes he carries one of the flock upon his shoulders, in others he plays the pipe while they listen, in others still he leads them to pleasant pastures, but always and everywhere it is the Good Shepherd who seeks and saves. This picture of love was the reply of the Roman Church to the harsh doctrine of the Novations in the 3d century.

The Saints.—Most of the pictures of the martyrs belong to the 4th, 5th, 6th, and even 7th centuries when their graves became shrines, and were richly decorated. They are Byzantine in execution and resemble the mosaics of that period. They are valuable as witnessing the style of vestments worn by ecclesiastics of the day. The Virgin Mary appears most frequently in the Catacombs as the central figure in the Adoration of the Magi. These vary in number from two to six, but uniformly wear the Phrygian cap. The two most interesting pic-

tures of the Madonna are in Priscilla and Ostrianò. The former is a 2d century representation of the Virgin with child in her arms, with a prophet in front of them, pointing to a star. It is a picture of much grace and excellent execution. Its classic lines do not appear again in Christian art for more than a thousand years. The latter is a 4th century Madonna and child, where the ✕ is placed on either side, as though it were a painted echo of the Council of Ephesus. The divine maternity of Mary was certainly in the mind of the artist, and the features of this painting are still preserved in Greek and Russian images. The saints are sometimes portrayed as "advocates" introducing into heaven the souls of those whose bodies were buried near their shrines. This ministerial mediatorship of the saints, exhibited in the Catacomb frescoes of the 3d and 4th centuries, became a common theme of the apsidal mosaics of the basilicas.

The Soul.—The soul is frequently represented by a young woman standing with arms outstretched in an attitude of prayer, called an *orans*. In paradise the soul is depicted as a bird flying among the flowers or feasting on the fruits or drinking from the chalice of heavenly delights. The celestial banquet is represented some six or seven times in Saints Pietro and Marcellino by the blessed seated at a semicircular table, feasting upon the mystic fish under the guidance of Peace and Charity. The judgment of soul standing before Christ in the presence of the martyrs, seems to be the subject of some obscure frescoes.

The Sacraments.—In the cemetery of Calixtus are a series of so-called Sacrament chapels, where the decorations are arranged to set forth a number of Christian truths. First, comes the scene of Moses (Peter) striking the rock. "And the rock was Christ." (1 Cor. x. 4.) In the mystic water of grace a small fish is being caught by the Apostolic fisherman. Tertullian has painted the thought in words. "We as little fish are born in the water after our *χθύς*, Jesus Christ." (Tert. de Bapt.) Then succeeds the Sacrament of Baptism, the source of the new life. The catechumen stands in the water, and the priest pours the laver of regeneration on his brow. Next follows the Eucharistic action, portrayed by a priest standing beside a tripod altar containing a fish and some bread, while an *orante* at the other side lifts her hands in prayer. The multiplication of the loaves and fishes and the banquet of Christ with his disciples by the sea of Tiberias next represent the Communion. And finally the resurrection as a result of the Communion is shown in the raising of Lazarus and the deliverance of Jonah. "He that eateth my flesh and drinketh my blood hath life everlasting, and I will raise him up on the last day." (John vi. 55.) There are two representations of the Eucharist worthy of remark. In the crypt of Lucina, the primitive centre of Calixtus, there are two frescoes (about 150 A.D.), in which two large fish carry on their back baskets containing bread and wine. Here Christ, the fish, the *χθύς*, bears the Eucharistic bread and wine which is himself. Saint Jerome would seem almost to speak of this scene: "No one is so rich as he who carries

the body of Christ in a wicker basket and his blood in a cup of glass" (Ep. ch. xxv. ad Rustic.). Another painting of first half of 2d century, discovered by Wilpert (1894), in the archaic part of Priscilla, the Capella Græca, seems to be a real representation of the Eucharistic action of the "Breaking of the Bread." Seven persons, one of them a woman, are seated at a semicircular table, on which are two plates with five loaves and two fishes. These, however, are evidently symbolical, for the priest at the head of the table is engaged in the very act of breaking the bread, and before him sits the Eucharistic chalice. This fresco is in a chapel, and seems to be an early representation of the Eucharistic sacrifice. The representations of the other Sacraments are rare and of doubtful interpretation. A general survey of these paintings leads to the conclusion that the early Christians saw nothing in religious representations hostile to the law of Moses; that the early Church had no repugnance to art, and that the art of the Catacombs is Roman and not of Oriental origin. Mgr. Joseph Wilpert has just published an accurate and complete edition of the Pictures of the Roman Catacombs with German and Italian texts (Rome 1903).

Sculpture.—Christian sculpture barely existed before the 4th century. Catacomb conditions were not favorable to its growth. A fresco could easily be painted in the gloom of the grave, but carved marbles were at once expensive and required light and space for execution. Moreover the sarcophagi in the pagan shops were often covered with idolatrous scenes. Some of these have been found in the Catacombs with the pagan images effaced. With the era of peace, however, the faithful began to use sculptured sarcophagi, and a number of them are preserved in the Lateran Museum. As far as workmanship is concerned, they are of inferior merit, being executed at a time when art had greatly degenerated. Some of them are little less than carved creeds, containing on their façade the main mysteries of the Christian religion. They shed much light on the earlier paintings. The clear carving of the 4th and 5th centuries illumines the doubtful fresco of the 2d and 3d. In the sarcophagi, it is Peter striking the rock and Peter to whom Christ gives the law. Hence in the earlier paintings Moses typified Peter. Daniel among the lions on the sarcophagi is evidently Christ on the Cross. Hence we have a key to the early representations of this scene.

Statuary.—But few pieces of statuary have been found in the Catacombs. While idols were on all sides, the faithful seem to have held aloof from this branch of art. However several statues of the Good Shepherd were executed, and one of the 3d century preserved in the Lateran is a most beautiful representation of the subject. The sitting statue of Hippolytus of the first part of the 3d century found in the cemetery of his name, is unique among early monuments. It contains inscribed on the cathedra a list of his works and his computation of the Easter Cycle.

Gold Glasses.—The gold glasses of which many have been found in the Catacombs, consist of a design made of gold leaf, enclosed

between two pieces of glass, ordinarily at the bottom of the glass. The subjects treated in these glasses of the 3d and 4th centuries, are of two classes. Some of them are genre pictures, ornamented with the portraits of a newly married couple or a family group, and inscribed with such toasts as "Drink! Live!" They were probably gifts for wedding and family feasts. Others used probably in the liturgical functions and perhaps as Eucharistic chalices were ornamented with the ordinary Catacomb cycle of paintings, but especially with the images of the Saints. Peter and Paul, Agnes and the Virgin Mary are the subjects most frequently represented. Eighty out of the three hundred published by Garucci portray Saints Peter and Paul. The constancy of the types, their correspondence with tradition, and the medallion of same characteristics found in Domitilla and attributed to the early part of 2d century, indicate that these are portraits of the Princes of the Apostles.

Mosaics.—There are but few mosaics in the Catacombs, and most of these of the age of peace. The mosaic is the distinctive Christian decoration of the basilica of the 5th and 6th centuries, as the fresco was of the Catacomb in the 3d and 4th.

Lamps.—The common clay lamp is the object most frequently found in the Catacombs. Most of them are in no respect different from those used by the pagans. However in the 3d and particularly in the 4th centuries, they were marked with the Christian emblems of the fish, the Constantine monogram, the Good Shepherd, the palm, etc. They illustrate the way the Christian faith entered into domestic life after the advice of the Apostle: "Whether you eat or drink—do all to the glory of God." (1 Cor. x. 31). The wine flagon and the wine cup, as well as the lamp and the loaf, were stamped with the sign of the cross in the 4th and 5th centuries. The few bronze lamps unearthed are of much more elaborate workmanship and symbolism.

Other Objects.—Rings, seals, and coins adorned with the characteristic symbols of early Christian art, have been found frequently in the excavations, as well as a number of miscellaneous objects, such as children's toys, combs, etc.

Inscriptions.—The numerous Catacomb inscriptions are of the greatest interest to the Christian scholar. The most precious of them have been arranged in the Lateran Museum by De Rossi. The bulk remains yet in the Catacombs and in the gallery of Christian inscriptions at the Vatican. They may be divided according to the method of execution into carved, painted, and "graffiti" inscriptions, the latter being writings rudely scratched on the plaster or tufa; according to time, into the original epitaphs and later laudatory inscriptions; according to language, into Greek and Latin; according to content, into dogmatic and domestic. Many of the tombs are without any inscription whatsoever, and many more are distinguished but by a rude mark or some object pressed into the fresh plaster. As a rule the early epitaphs are the shorter, although brevity is a distinguishing trait of Catacomb epigraphy, in marked contrast to the lengthy pagan eulogies of the time. The name of the

departed, with a short prayer and some symbol as the fish, palm, anchor, or Constantine monogram, to which was sometimes added the date of burial and age, forms the ordinary inscription. "Gerontius, may you live in God," "Lucilla in pace"; are characteristic epitaphs. The word "deposition" is peculiar to Christian epigraphy, implying that the body is consigned but for a time to the soil. The short prayers and symbols on the tombs are in general but a reproduction of the "Memento of the Dead in the Mass." *Ipsis, Domine, locum refrigerii, lucis, et pacis, ut indulgeas, deprecamur*, "Refreshment, light, and peace grant to them, O Lord." This is the requiem chanted and carved in the Catacombs. Despite the fact that the inscriptions are sepulchral, they yet contain much matter of dogmatic and historic interest. They express belief in the unity and trinity of God, in the divinity of Christ, in the Holy Spirit, in the resurrection, and almost every article of the creed is carved on some monument. Especially strong is the testimony of the Catacombs to prayers for and to the dead. Both are sometimes found in one inscription, as this from Domitilla:

VIBAS
IN PACE ET PETE
PRO NOBIS.

"Gentianus,—pray for us because we know that thou art Christ," we read in another. "Holy Martyrs, remember Mary," comes from Aquileia. *Januaria bene refrigera et Roga pro nos*. This last inscription from Calixtus is a fair sample of Catacomb Latinity. It is ornamented with a small box, containing the rolls of the law, the customary representation of the Bible in early Christian art.

Papal Crypt.—The inscriptions of the crypt where the Popes of Rome were interred in the 3d century, are of peculiar interest

ΑΝΤΕΡΩΣ Δ ΕΠΙ ΦΑΒΙΑΝΟΣ · ΕΠΙ · ΝΡ

These inscriptions show that Greek was still the official language of the Church in the 3d century. The monogram Mr, martyr, was the official canonization of the Catacombs.

Damascene Inscriptions.—Pope Damasus (304–385), the first Christian archaeologist, embellished the tombs of the martyrs with a series of metrical inscriptions, carved on large slabs of marble by his secretary, Furius Dionysius Filocalus. The texts of 40 of these are preserved in the ancient itineraries, and many of the original slabs have been discovered in the excavations of the last 50 years. The inscription of the papal crypt was found broken in 125 small pieces, which when joined together, gave the entire text. Of all these inscriptions, but a fragment of the title at the tomb of Pope Cornelius remains in its primitive position, so thorough was the work of the devastating Lombard and destroying time. The tomb of Damasus himself, so long sought by the archaeologists, was discovered at the close of 1903 by Mgr. Wilpert. The work of excavating is still going on, but enough data has already been dug from the depths to make it certain, that whoever would go back to Christ, must pass through the corridors of the Catacombs. Here he will find the mind of the Master in

the might of the martyr, and the love of the Saviour in the liberty of the slave. Here he will find church and Sacrament, right and ritual, creed and deed. Here he will come upon a society, Catholic in composition and in charity, Christian in faith and in hope, sleeping the sleep of peace and awaiting the resurrection of the flesh in X. The scientific study of the Catacombs has shown that the Christians were numbered in Rome by tens of thousands in the 3d century. "We are of yesterday yet we fill all that belongs to you; we leave to you only your temples." The rhetoric of Tertullian is the reality of the Catacombs. The researches of De Rossi have shown, too, that the acts of the martyrs have much more historical value than the critical school of history was formerly inclined to give them. Further and fuller research will act as *luminaria* to dissipate the darkness which controversy has gathered round the Catacombs. And when the treasures of Roma Sotterranea are all unearthed, should all other witnesses of the faith once delivered to the saints become silent, the very stones of the Catacombs will cry out to the world the wisdom and grace of Christ.

Consult: Lowrie, 'Monuments of the Early Church' (1901), gives in an appendix the best Catacomb bibliography accessible to the English reader. WILLIAM TEMPLE, D.D.,

Roman Catholic Church. See CATHOLIC CHURCH.

Roman Catholic Church in Canada, The, will be treated in this article under three headings: 1. The Church under the French, from the discovery of Canada until the conquest by England (1534-1763); 2. The Church under the rule of Great Britain, from 1763 until the present day; 3. Present condition.

1. *Before 1763.*—Catholicism was planted in Canada by France, through whose sailors, Aubert de Dieppe (1508), Verazzano (1522), and especially Jacques Cartier (1534), it was discovered about the beginning of the 16th century. Cartier penetrated the estuary of the Saint Lawrence (10 Aug. 1535), and took possession of the country in the name of King Francis I. While endowing his fatherland with new countries, he proposed also to disseminate therein the Catholic faith, as related in the account of his travels inserted in the 'Histoire de la Nouvelle France' by Marc Lescarbot, Paris 1609.

From Cartier to Champlain (1542-1608) a few attempts at colonial settlement in Acadia was succeeded by the foundation of Port Royal (now Annapolis, N. S.). There appeared the first missionaries, Jesuits and secular priests. Champlain visited Canada in 1603, and in 1608 founded the town of Quebec and settled there. In 1615 he invited Recollet Fathers from France, who became the first apostles to the Indians, and inaugurated those missions in the interior of Canada so famous during the 17th century, and in which the Jesuits (1625) and the Sulpicians (1657), soon took such a glorious part.

Two distinct and savage races, the Algonquins and the Huron-Iroquois inhabited the countries just opening up to missionary zeal.

To the Algonquin race belonged the Abenakis the Montagnais, the Attikameques or Poissons-Blancs, the Otawawas, and several other tribes scattered from Hudson Bay to the western prairies. From the Huron-Iroquois source sprang two great branches: the Yendats or Hurons established between Lakes Huron, Erie, Saint Claire, and Simcoe, and the Iroquois who dwelt south of Lake Ontario, and were divided into five nations: Mohawks, Onondagoes, Senekas, Oneidas, and Caiyoquos. It would appear that the total population of these tribes was not above 100,000 individuals.

The Recollets were the first to devote themselves to evangelization among the Indians. Father d'Olbeau instructed the Montagnais; Father Le Caron penetrated deeply into the land of the Hurons to carry them the true faith, while several fathers remained at Quebec preaching among the colonists and the surrounding savages. During ten years they multiplied their travels, their preachings, opened schools for Indian children, called to their assistance new recruits, and among them Father Viel, who perished in the Ottawa River, victim of the perfidy of a Huron. Consult: F. Sagard, 'Histoire du Canada,' Paris 1686; Ch. Beaubien, 'Histoire du Sault-au-Récollet,' Montreal 1897. Unable to fill the wants of the missions alone, the Recollets called upon the Jesuits (1625), and on their invitation Fathers Brebeuf and Lalemant with other missionaries came to Canada. Their efforts for the conversion of the savages were not attended with the success hoped for, owing to the opposition of the Company of Merchants, to whom the French king had conceded the monopoly of traffic in these regions, on the condition of founding a colony. Louis XIII. and Richelieu replaced them (1627) by the Company of New France who engaged to lead "the people inhabiting Canada to the knowledge of God, and to instruct them in the Catholic, Apostolic and Roman religion." There was no time to see the effects of these good intentions, for less than two years later (1629), Quebec and the colony fell into the power of David Kerth, who fought on the side of England. The missionaries and their helpers were obliged to return to France.

When Canada was returned to France by the Treaty of Saint German-en-Laye (1632), the Jesuits at the request of Cardinal de Richelieu again took up their missions. Father Lejeune organized religious service at Quebec and opened the college of that town (1635), then he plunged into the interior in search of the wandering tribes of Montagnais. Others established a mission at Miscou, and from there branched forth into the peninsula of Gaspé, into Acadia and Cape Breton. Trois Rivières and Tadousac on the banks of the Saint Lawrence became centres of evangelization. Consult 'Les Jésuites et La Nouvelle France au XVIIe siècle,' par le Père de la Rochemontaix, S. J. Paris, 1895.

Meanwhile hospital religious and Ursulines arrived at Quebec (1639), the first to direct a Hôtel-Dieu endowed by the Duchess of Aiguillon, niece of Richelieu; the second at the head of whom was Marie de l'Incarnation, to provide for the education of the girls. These heroic women were rivals in zeal for the conversion of the savages. Consult: Abbé Casgrain, 'Histoire de l'Hôtel-Dieu de Québec,' Québec, 1878;

Id., 'Histoire de la Vénérable Marie de l'Incarnation,' Quebec, 1880; 'Lettres de Mère Marie de l'Incarnation,' Paris, 1681.

About this time the Company of Montreal was formed. Its originators were two men of God, M. Olier, founder of the Seminary of Saint Sulpice, and M. de la Dauversière, a pious laic. Its sole aim was the "glory of God and the establishment of religion in New France without charge to the clergy or to the people." Encouraged by Urban VIII., it found in Paul Chomedey de Maisonneuve a faithful executor of its intentions. This illustrious man landed on the island of Montreal which the society had acquired, 18 May 1642, and laid the foundations of Villemarie, now Montreal. With him came Mlle. Mance, foundress of the Hôtel-Dieu, and they were soon joined by Marguerite Bourgeoys, an energetic and saintly woman, who organized the religious of the Congregation of Our Lady (1653) for the education of Canadian girls. In 1657, Mr. Olier when dying, sent to the colony the first four Sulpicians: de Queylus, Souart, Gallinier and d'Allet. Consult: Dollier de Casson, S. S., 'Histoire du Montréal,' published by the Historical Society of Montreal, 1866; Faillon, S. S., 'Histoire de la colonie française en Canada,' Montreal, 1865; Id., 'Vie de la Vénérable Mère Bourgeoys'; 'Vie de Mlle. Mance,' Paris, 1854; Id., 'Vie de M. Olier, founder of the Seminary of Saint Sulpice,' 3 vols. Paris, 1873; P. Rousseau, S. S., 'Vie de Paul Chomedey de Maisonneuve,' Montreal, 1886.

The hour of martyrdom sounded for the Jesuits. After escaping twice from the ferocious Mohawks, Father Jogues died beneath their blows (1646). Two years later (1648), the flourishing mission among the Hurons was completely destroyed by the Iroquois, and five Jesuits, Fathers de Brebeuf, Daniel, Lalemant, Garnier and Chabanel, were overwhelmed in the massacre of their neophytes. Father Buteux also fell a victim to the Iroquois when going to the Attikamèques (1652), and Father Bresani escaped with difficulty from these barbarians. Consult: Charlevoix, 'Histoire et Description générale de la Nouvelle France,' Paris, 1744; 'Relation des Jésuites,' Quebec, 1858; these two works with the 'Relations inédites de la Nouvelle France' (1672-1779), and other documents have been collected and published with an English translation in the edition of Reuben Thwaites, Cleveland, 1897, under the title: 'Travels and Explorations of the Jesuit missionaries in New France' (1610-1791); Parkman, 'The French pioneers in North America.' These attacks of the Iroquois became the terror of the colony. Montreal owed its salvation only to the bravery of Maisonneuve and to the heroic devotion of young Dollard, who at the head of sixteen companions for several days faced over seven hundred Iroquois, and resisted them to the death.

The year 1659 marks the commencement of the ecclesiastical hierarchy in Canada. Monsignor François de Montmorency-Laval was named Bishop of Petrea and Apostolic Vicar of New France by Alexander VII. The prelate had numerous difficulties with the governors d'Avangour and de Mézy (1663-1665) over the traffic in brandy which was causing ruin among the Indians. He opened a small seminary for

the training of future clerks, and 10 years later (1678), laid the foundations of a large seminary for preparation for the priesthood. In 1674 Quebec was created a bishopric by Clement X.; the jurisdiction of the new see extended over all North America until 1789, the year in which the bishopric of Baltimore was created. To Monsignor Laval are also due, the creation of charges with resident priests, the incorporation of the Seminary of Quebec and its union with the Seminary of Foreign Missions at Paris, the creation of a chapter of canons; in one word a good diocesan organization. He came in conflict with Governor Frontenac and Intendant Talon to maintain the rights of the Church and to extirpate the abuse of the liquor traffic.

Under his episcopacy the missionaries continued their work. The Sulpicians saw two of their number fall beneath the blows of the Iroquois at Villemarie (1663). Shortly after Messieurs Trouvé and de Salignac-Fénelon, brother of the illustrious Archbishop of Cambrai, founded the mission of Kenté (1668), at the point on Lake Ontario where debouches the Saint Lawrence. During fourteen years it was a centre whence the true faith radiated throughout all the surrounding region as far as Niagara. The following year (1669) Messieurs Dollier de Casson and Bréhan de Gallinée, Sulpicians, left Villemarie in the company of Cavalier de La Salle with the resolution of advancing west to the Mississippi. Abandoned by the discoverer they traversed alone the region of the Great Lakes, and returned to Montreal after one year of exploration and research; there M. de Gallinée prepared a relation and made a map of the expedition. We should mention also the Sulpician missions of la Montagne, Gentilly, l'Île-aux-Tourtes and Lac-des-Deux-Montagnes, all in the environs of Montreal. The Jesuits on their side prosecuted arduously their missions. Father Menard evangelized the Outaouais, Father Alouez penetrated as far as Lake Superior (1665), and Fathers d'Ablon and Marquette planted the cross at Sault Sainte Marie. Other Jesuits joining the explorers Saint-Lusson and de La Salle, took possession of the banks of Lake Huron; and two years after (1670) Father Albanel penetrated, while traveling by the Saguenay, as far as Hudson Bay. The missions to the Iroquois were resumed, but without great success. In 1669 the sedentary mission of the Prairie de la Madeleine was founded to the south of Montreal. There expanded the lily of Canada, that Catherine Tegakouita, who died in her twenty-third year, and for whom the III. Council of Baltimore has asked the process of canonization. This mission transferred to Sault-Saint-Louis, now Caughnawaga, is still flourishing (having over 2,000 members), and after numerous vicissitudes has again come into the hands of the Jesuits. From Canada also went Joliet and Father Marquette on their discovery of the Mississippi (1673). Consult: 'Récit des voyages et découvertes du Père Marquette,' New York, 1855; Reuben Gold Thwaites, 'Father Marquette,' New York, 1902.

Recalled to Canada by Talon, the Recollet Fathers (1670) established themselves at Quebec and had four missions: Trois-Rivières, l'Île Percée (Gaspé), Saint-John River and Fort Frontenac on Lake Ontario. In 1682, Mr. Dollier de Casson called them to Montreal, and in

4. Most Rev. Charles Hugh Gauthier, D.D.,
Archbishop of Kingston.

5. Most Rev. Denis O'Connor, D.D.,
Archbishop of Toronto.

1692 the missions of Cape Breton and of Plaisance in Newfoundland were confided to them.

Meanwhile Monsignor Laval worn out with his administration, gave in his resignation to Louis XIV. (1684). After four years' sojourn in France, he returned to Quebec (1688), where he lived in profound retirement until his death in 1708. The episcopacy of Monsignor Laval marks one of the most prosperous epochs of the Canadian Church and of the colony. Between 1665 and 1680, thanks to the intelligent activity of Colbert and de Talon, more colonists came to Canada than in the preceding half century. A strict supervision was exercised in the choice of the young women sent, as much as regarded their physical as their moral qualities. Several whose loose manners might have become a cause of corruption and decadence rather than of growth, were rejected. Consult: Gailly de Taurines, 'La nation canadienne,' Paris, 1894; Ferland, 'Cours d'histoire du Canada.'

Monsignor de Saint-Vallier succeeded Monsignor Laval. The new bishop founded the general hospital of Quebec, endowed it with his own contributions, built the episcopal palace, published a catechism for the diocese, established ecclesiastical conferences, and held the first synods. In 1690, the English admiral Phipps, having attacked Quebec with 32 vessels, the prelate in a pastoral letter exhorted the Canadians to bravely do their duty. When after useless efforts the enemy had departed, the bishop dedicated to Our Lady of Victory, the church in the lower town, still standing, as a monument of Heaven's protection.

The era of great missions passed; nevertheless Cadillac and a missionary founded the town and colony of Detroit (1700); the priests of the seminary of Quebec became the apostles of the Tamarois, between the Illinois and the Ohio Rivers; the Jesuits evangelized the Miamis, the Sioux, the Otawawas, the Illinois, and held their ground amid the Iroquois. With the opening of the 18th century, commenced the furious and repeated assaults of England and its American colonies against the little Catholic colony, in which the French Government, careless of the future, became less and less interested. The emigration to New France ceased toward the end of the preceding century. No more were to be seen the great convoys setting sail for America crowded with new populations full of faith and energy. In 1713 the French Canadian population was 18,000, and in 1739 scarcely reached 42,000. It was a small number to resist an adversary which counted in 1706 260,000 individuals, and which was increasing each year.

Acadia especially was weak, having but two thousand inhabitants of French origin. The first attacks were directed against her. After having resisted in 1704 and in 1707, she fell (1710) into the power of the English colonists, and three years later, the Treaty of Utrecht (q.v.) (1713) ceded Acadia, Newfoundland, and Hudson Bay to England. From this epoch to that of the violent dispersal of the Acadians by Lawrence (1755), the Catholics found devoted support in the Sulpicians and the priests of the seminary of Quebec who were their missionaries. The names of Geoffroy, Baudoin, Trouvé, de Breslay, Metivier, de la Gondalie, de Miniac, Chauvreuse, and Desenclaves, of

Saint-Sulpice; of Petit, Thury, Gaulin, of the seminary of Quebec, deserve to be remembered by posterity. Mention should also be made of Father Rasles, S. J., missionary to the Abenakis, who was killed by the English. We will not recall here the incredible atrocities which have relegated Lawrence's memory to the execration of humanity, and which Longfellow has immortalized in his touching poem 'Evangeline.' Consult: Richard, 'Acadia, Missing Links of a Lost Chapter of American History,' (Montreal, 1895); Abbé Casgrain, 'Les Sulpiciens en Acadie' (Quebec 1897); Id., 'Un pèlerinage au pays d'Evangeline' (Quebec, 1885).

These painful events only too plainly foreshadowed the fate awaiting the Canadian colony. Instead of sending men, France persisted in raising at great expense useless fortifications at Louisbourg and at Quebec. Canada was to fall through lack of foresight.

The episcopacy of Monsignor de Saint-Vallier lasted until 1727. The endowments with which he enriched the various religious establishments of the country, have been estimated at £600,000. His successor, Monsignor Duplessis-Mornay, never came to Canada. He governed his diocese by an administrator. Resigning in 1773, he was replaced by Monsignor Dosquet who devoted himself to promoting the education of youth and the religious life in the communities. Monsignor de Lauberivière who succeeded him, died a month after his arrival in his diocese, victim of his charity in attending soldiers attacked with scurvy (1740). His successor was Monsignor de Pontbriand (1741-1760), the last bishop under the French régime. He built a cathedral, restored the Ursuline monastery at Trois-Rivières and the Hôtel-Dieu of Quebec, which had been destroyed by fire, established ecclesiastical retreats, and by his science and virtue was the model of his clergy.

Among eminent priests of this epoch should be mentioned M. de Belmont, superior of Saint-Sulpice at Montreal (1701-1732), who covered the region with his liberalities and his works; M. Normant du Faradon, his successor (1732-1759), who with the Venerable Mother d'Youville shares the glory of having founded the admirable charitable institution of the Grey Sisters. Consult: Faillon, S. S., 'Vie de la Vénérable Mère d'Youville' (Montreal, 1852). To Saint-Sulpice belonged also that abbé Picquet to whom the town of Ogdensburg erected (1899) a monument, as well as to its founder. Consult: 'Lettres édifiantes et curieuses' (Lyon 1819); 'Mémoire sur la vie de M. Picquet' by M. de la Lande, of the Academy of Sciences, p. 262; 'Biographie universelle ancienne et moderne' (Paris 1823, Vol. XXXIV. p. 289); 'Revue canadienne, janvier et février 1870,' Vol. VII.; 'l'abbé Picquet,' by J. Tassé.

The events which precipitated the fall of Canada are well known. Quebec taken (1759), the bishop died at Montreal (1760) without seeing that town in the hands of the English. M. Briand undertook the administration of the region of Quebec; M. de Montgolfier, Sulpician, of that of Montreal. The Treaty of Paris which ceded Canada to England was signed 10 Feb. 1763. The period of establishment closed for the Canadian Church, and that of conflicts and of progress opened.

2. *After 1763.*—All the natural chiefs of the Canadians recrossed the ocean with the French flag. A population of 70,000 souls was abandoned without a guide. The clergy alone remained, invested with the double mission to preserve the ancestral faith and direct the people in the attainment of their civil and political rights. They understood their mission and it can be truthfully said that they did not fail therein.

The Treaty of Paris, it is true, guaranteed the Canadians "the free exercise of their religion," but with the addition "so much as the laws of Great Britain will permit." This restriction left a great latitude in the interpretation of the treaty. In fact it was a species of persecution. The government of London thought to substitute the Anglican hierarchy and religion for the Catholic hierarchy and religion and flattered itself in easily overcoming the conscience of a handful of colonials. The French laws were abolished and the oath of allegiance exacted from all Canadians. They notified the priests that they would have to subscribe to it or prepare to leave Canada. It was a demand to abjure and rebel against the authority of the Roman See. At the same time they prepared a list of the churches, the priests, their charges, their revenues, their property, also one of the religious communities with their constitutions, rights, privileges, and properties. In addition George III. encouraged the governors to found Protestant schools so that the Church of England could be established in principle and in practice, and the inhabitants gradually be brought to embrace the Protestant religion, and their children educated in the principles of that religion.

The communities of men were also condemned to die out. Recollets, Jesuits, and Sulpicians were prohibited from recruiting in the country or from receiving members from abroad. They took possession of the properties of the first, and as to the Sulpicians, they were reduced from 30 which they were in 1760, to two septuagenarians, whose deaths they awaited to take possession of their effects, when the French Revolution broke out. The English Government then relaxed its rigorous attitude and offered the victims of the furious revolutionists an hospitality which does them honor. The people though were not better treated. For them there were no public positions, no place in the councils of the colony. A species of ostracism followed them everywhere. In the midst of these painful conjunctions the Catholics did not despair; they sent to London petition upon petition claiming on the faith of the treaties the preservation of their religion, their priests, their language, and their civil rights. At last in 1766, George III. consented to the consecration of Monsignor Briand, as Bishop of Quebec, without recognizing any other title, however, than that of Superintendent of the Catholic cult.

Meanwhile a storm was arising in the Anglo-American colonies. The metropolis understood that it should conciliate the Canadians. The Act of Quebec (1774) restored the French civil laws, dispensed with the test-oath, and recognized their civil and political rights. During the war which followed and which terminated with the death of Montgomery (1775)

under the walls of Quebec, the Canadian people, docile to the voice of their clergy, remained faithful to the sovereign which Providence had given them.

During these years the Catholic population had grown: in 1784, it numbered 130,000 French-Canadians; the Maritime Provinces were being peopled by Irish and Scotch Catholics, and the Acadians dispersed in 1755, were grouping silently and multiplying, supported by such apostles as the abbés, Desjardins, Sigogne, de Calonne, and Ciquart, Sulpician. "To these confessors of the faith the Acadian race owed its organization; these were the true founders of its nationality." Consult: 'Vie de l'abbé de Calonne,' (Trois-Rivières, 1892); Casgrain, 'Pèlerinage au pays d'Évangéline.'

After having courageously combated, Monsignor Briand died in 1784. His successor, Monsignor d'Esclis, was an old man of 75 years. He speedily took a coadjutor in the person of Monsignor François Hubert, who became titular bishop in 1788. In a remarkable memoir to the Holy See (1794), the prelate states that his diocese contained 160,000 Catholics; that the efforts of the Anglicans to win the Canadians to their religion were in vain; that his diocese is too vast for him to administer conveniently. But, he added "every plan of division would find insurmountable obstacles on the part of Great Britain which is occupied on the other side in the means to establish in this country a Protestant clergy." Consult: 'Mandements des évêques de Québec,' Vol. XL, p. 474.

Monsignor Denaut (1797-1806), succeeded Monsignor Hubert. Under his episcopacy the fight against Anglicanism is summed up in the Royal Institution. Thus was named a cleverly composed organization designed to monopolize instruction of every degree by concentrating the power in the hands of the governor. The Anglican Bishop Mountain was chosen as president of the Institution. Profiting by a legal restriction the Catholics prevented its success. Consult: S. Pagnuelo, 'Études historiques et légales sur la liberté religieuse en Canada,' (Montreal, 1872).

From 1806 to 1825 the episcopal see of Quebec was occupied by Monsignor Octave Plessis, a prelate distinguished as much by the breadth of his intelligence and the force of his character, as by his courtesy in all proceedings. He had to hold his own against a powerful oligarchy which would not recoil from extreme measures, and which was resolved to make the Church the vassal of the civil power, the slave of the government; in fact to insensibly lead Canada to Anglicanism by the governmental channel. The soul of this plan was a certain Witzius Ryland, secretary of the governors of Canada from 1790 to 1812. It would take too long to enter into the details of this struggle, into which Sir James Craig was weak enough to enter; it suffices to say that Monsignor Plessis by his individuality embodied Canadian resistance without ever wounding English sentiment; that he obtained for himself official recognition of his title, Bishop of Quebec (1813); that he removed the pretensions of the government to nominate rectors; that he ensured the independence of the Church against the State; and that he inspired his adversaries even, with respect and admiration for his great

ROMAN CATHOLIC CHURCH

character. Faithful besides to the Crown of England, his was the act of a loyal subject in calling to arms his diocesans, on the occasion of the invasion of the United States in 1812. Well and justly could Lord Bathurst reply to the Anglican Bishop of Quebec, J. Mountain, who protested against the favors accorded Monsignor Plessis by the London Government. "It is not when Canadians are fighting for England that such questions should be agitated." Consult: Pagnuelo, 'Etudes sur la liberté religieuse en Canada,' c. IX.-XI., p. 86-120; 'Le Correspondant,' April, 1877; 'La France Canadienne,' by J. Guérard; Garneau, 'Histoire du Canada,' t. III. i. XIII. c. 11. and t. XIV. c. I.; 'Mandements des évêques de Québec,' t. III.; 'Conversation entre Sir J. Craig et Mgr. Plessis,' p. 59; 'Mémoire au gouverneur,' p. 79; French 'Biographical notice of J. O. Plessis, Bishop of Quebec,' (Quebec, 1864); L. O. David, 'Biographies et portraits,' (Montreal, 1876, p. 80); Bédard, 'Histoire de Cinquante ans,' (1791-1841), (Quebec, 1869, c. IV. et V.).

Monsignor Plessis understood the necessity for dividing his vast diocese. Already in 1817 New Scotland was detached with Monsignor E. Burke as Apostolic-Vicar. This did not suffice. Soon the Apostolic-Vicariates were created of Upper Canada with Monsignor MacDonell as titular; of New Brunswick and Prince Edward's Island, with Monsignor MacEachern; of the Northwest with Monsignor Provencher; of the district of Montreal with Monsignor Lartigue, Sulpician (1820). These divisions were completed after the death of Monsignor Plessis, by the creation of the sees of Kingston (1826); Charlottetown (1829); and of Montreal (1836).

In the course of years the number of French-Canadians kept on increasing. In 1831 it attained 380,000. In less than 50 years, it had increased by nearly 280,000 souls. This progress was not of a nature to reassure the intolerant and exclusive set which existed on the side of the Anglo-Protestants. Already, about 1820, they had tried to abolish the constitution of 1791, which assured an independent existence to the Province of Quebec, and wished to unite Upper and Lower Canada, with the scarcely veiled object of outnumbering the French Catholic population. This plan had failed, thanks to the firmness of Bishop Plessis and his clergy, who rallying the forces of the country, victoriously opposed Protestantism. Unfortunately, after the death of the bishop, several influential members of the legislative body deserting the sure ground of legal resistance, slipped upon the slope of revolution, fanned the spirit of revolt by their indignant philippics, and provoked the troubles of 1837-8, when several hundred countrymen led astray by their representatives, flew to arms. Nevertheless, let us say that the voice of the Catholic clergy was sufficiently powerful to keep the mass of the population in the path of duty. The result of this insurrectional movement was the union of the two Canadas. The Act of Union was passed by the Britannic Parliament 23 July 1840.

Before this act of despotism (consult Turcotte, 'Le Canada sous l'Union,' p. 60), which marks an important date in the history of Canada, several works had been created, several

deeds accomplished which interest the Church. The seats of education had multiplied: the college of Montreal (1767) founded by M. Curat-teau, priest of Saint-Sulpice, and then (1806-28) so prosperous under the direction of M. Roques; the colleges of Saint-Hyacinthe (1809), of Sainte-Thérèse (1825), of l'Assomption (1832), of Sainte-Anne de la Pocatière (1829). Mention should be made also of the formation of the Société d'éducation of Quebec, to promote primary instruction, and the acceptance of the Factory Law (1824), so favorable towards the same end. To this same period belongs the acknowledgment of the properties of the Seminary of Saint-Sulpice at Montreal by the government of Queen Victoria (1839). This act of justice allowed this venerable institution to follow the course of its charities and to cover the Montreal region with its intelligent liberalities.

To Monsignor Panet, who had replaced Monsignor Plessis (1825-1832), succeeded Monsignor Signay. His episcopacy was marked by many misfortunes: cholera (1834), civil war (1837-8), two fires in Quebec (1845), typhus brought by the Irish driven from their country (1847). The 15 years which followed 1840 were more fruitful for the Canadian Church. Five communities of men, and 15 of women dedicated to the ministry, to teaching, or to charity, came from France to settle in Canada. The Oblate Fathers of the Immaculate Mary (1841), the Jesuits (1842), the clerks of Saint-Viateur, the Congregation of Sainte-Croix (1847), and the Brothers of the Christian Schools answered to the call of Monsignor Ignace Bourget, Bishop of Montreal (1840-79). Then were founded the Sisters of Providence (1843), of the Holy Names of Jesus and Mary (1843), of Mercy (1848), of Saint Anne (1849). At the same time the episcopal sees were multiplied: Toronto with Monsignor de Charbonnel, S. S. (1842); Saint John, N. B. (1842). Quebec elevated to the dignity of an archbishopric received as suffragan sees Montreal, Kingston, and Toronto. The same year (1844) the bishopric of Arichat, N. S., transferred to Antigonish since 1886, was created: in 1847 the see of Bytown or Ottawa and of Saint John, Newfoundland. United in council at Quebec (1851), the bishops decide on the foundation of Laval University and ask the Holy See to establish the sees of Trois Rivières and Saint Hyacinthe (1852). Let us mention also the foundation of societies for colonization, for temperance, of Saint-Vincent de Paul, and of an educational system for separate schools for Catholics.

Meanwhile the Catholic population had increased considerably. In the Province of Quebec it more than doubled in 30 years; in 1831 it counted 425,000, in 1861, 942,800 souls; in Ontario it attained 260,000. This development demanded the multiplication of primary schools. This was the work of J. B. Meilleur, of whom it can be said, "he undertook the direction of Public Instruction from its cradle; that he had to create everything even to the love of instruction among the people." Consult: J. B. Meilleur, 'Mémoires sur l'éducation au Bas-Canada,' Quebec, 1876. The Catholic colleges were opened of Joliette (1846), of Rigaud (1850), of Saint-Lawrence (1847), of Saint Mary of Monnoir and Levis (1853). That

same year (1853), the Seminary of Quebec undertook the heavy but glorious task to build Laval University which was inaugurated in the presence of Lord Elgin, 14 September 1853, and which since has rendered such immense services to the Catholic cause and to the country. Consult: C. Roy, 'L'Université Laval et les fêtes du Cinquantenaire,' Quebec, 1903.

While these works were being accomplished in the East, the West was opening to evangelization. With Monsignor Provencher, the first apostles of these districts had penetrated along the Red River. Wishing to ensure the future of these missions, the Bishop of Saint-Boniface called to his assistance the Oblate Fathers and even chose from them Father Taché as coadjutor. Monsignor Provencher died in 1853 and was succeeded by Mgr. Taché. He had to expend his intelligence and his strength during 40 years (1853-94). It does not enter into the limited scope of this essay to recount the works of the Oblates in the Far West; although they constitute one of the most remarkable chapters of the Catholic missions. The apostolic-vicariates and the episcopal sees embrace in their jurisdiction every point in these distant regions which came under the indefatigable zeal of these missionaries.

Consult: G. Dugas, 'Monsieur Provencher et les Missions de la Rivière-Rouge,' Montreal 1889; Piolet, S. J., 'Les missions Catholiques françaises,' Paris 1902; Monsignor Taché, 'Vingt années de missions dans le Nord-Ouest de l'Amérique,' Montreal, 1869; Don Benoit, 'Vie de Monsigneur Taché,' Saint Boniface, 1904; Père Jonquet, O. M. I., 'Vie de Monsigneur Grandin,' Montreal, 1904; R. Cooke, O. M. I., 'Sketches of the Life of Monsignor de Mazenod,' London, 1879.

The years which followed 1860 were full of solicitude for the Catholic clergy. The Councils of Quebec show us the bishops preoccupied with the progress of impiety, with evil books, with the weakening of the faith, and painfully affected by the events which led to the invasion of the Pontifical domains by the armies of Victor Emmanuel. The Canadians flew to arms and several detachments of zouaves offered their services to Pope Pius IX. (1868).

The Catholic hierarchy had developed in the course of years. In 1852, Halifax was created an archbishopric with Charlottetown, Saint John, N. B., Arichat, N. S., and soon after Chatham, N. B. (1860), as suffragan sees. The year 1871 marked the creation of the ecclesiastical province of Saint Boniface (Manitoba), with the bishopric of Saint Albert (1871), and the apostolic-vicariates of Athabasca-Mackenzie and of Saskatchewan for suffragans. In the preceding year (1870) Upper Canada was created an ecclesiastical province with Toronto for archbishopric and Kingston and Hamilton for suffragans. Since then Kingston has become an archiepiscopal see (1878) with two suffragans: Peterboro (1882) and Alexandria (1890). In the province of Quebec, Sherbrooke (1874), Chicoutimi (1878), Nicolet (1885) became bishoprics. In 1886, Montreal was created an archbishopric under Monsignor Fabre, with Saint Hyacinthe and Sherbrook as suffragans, to which have since been added Valleyfield (1893), and Joliette (1904). The same year Leo XIII. created the ecclesiastical province of

Ottawa, which received as suffragan the episcopal see of Pembroke (1898). To crown this flourishing hierarchy, Leo XIII. honored with the cardinal purple Monsignor Taschereau, Archbishop of Quebec (1886). To conclude the study of the second half of the 19th century, mention must be made of three particular points. *a.* The Awakening of the Acadian Race, which had expanded imperceptibly.—From the 25,000 that they were in 1815, the Acadians increased to the number of 80,000 (1864), and 125,000 (1899). To Father Lefebvre, a Canadian priest, is due the merit of having amalgamated them and, in founding the college of Memramcook, N. B., of having contributed powerfully to render them a force for Catholicism in the Maritime Provinces. To-day the Catholics of French origin in that region amount to 155,000. Consult: P. Poirier, 'Le Père Lefebvre et l'Acadie,' Montreal, 1898. *b.* The Schools of New Brunswick and of Manitoba.—In 1867 when the Canadian Confederation was founded, the educational system of New Brunswick allowed the Catholics of that province to have separate schools. This right was refused them in 1871, the aim being to compel them to send their children to the public schools, that is to say, Protestant schools. An organized resistance spread everywhere and to avoid a sanguinary conflict, a compromise was effected. The unjust law was not abrogated but the concessions were of such a nature that peace was re-established (1874).

An injustice of the same kind wronged the Manitoban Catholics in 1890. Despite the vigorous fight led by Monsignor Langevin, successor to Monsignor Taché in the see of Saint Boniface, the iniquity was not amended, but a compromise was arranged between the Laurier Government and the Holy See, which for want of a better, softened without destroying the disastrous effects of the law. This question which so impassioned the minds in 1896 gave rise to the creation of the Apostolic Delegation to Canada, a post first occupied by the present Secretary of State to Pius X., Cardinal Merry del Val, and now, by Monsignor Donato Sbarretti, ex-archbishop of Havana, who succeeded (1902) to Mgr. Diomede Falconio, presently apostolic delegate to the United States. *c.* The foundation of Laval University at Montreal.—For a long time Montreal was in want of a Catholic university. Monsignor Bourget applied to the Propaganda. Not to injure the rights of Quebec, a branch in Montreal was granted by the pontifical bull *Inter varias sollicitudines* (1876). The powers and the autonomy of this branch were signally increased by Leo XIII. (1889). In need of the necessary buildings, the liberality of the Seminary of Saint Sulpice, governed then by M. Colin, filled this void. Laval University at Montreal now has spacious premises and numerous professorships.

3. *Present Condition.*—(a) Ecclesiastical provinces.—The total Catholic population in Canada is estimated at 2,230,008 by the census of 1901. Since then it has increased about 100,000 through immigration. With 1,430,000 Catholics, the province of Quebec alone comprises three-fifths of the faithful followers of Rome in Canada. Nearly 900,000 are scattered throughout the other provinces. Everywhere, except in Ontario, in Manitoba and in British

ROMAN CATHOLIC CHURCH

Columbia, Catholicism exceeds in the number of its adherents any of the separate Protestant sects. It embraces 42 per cent of the total population of the Dominion, which is 5,371,315. From 1890 to 1900 the Catholics increased by over 250,000 souls. This gain was effected despite a very pronounced emigration movement of French Canadians to the Northeast of the United States. The following table gives at a glance the ecclesiastical divisions of the Dominion of Canada:

| ARCHBISHOPS SUFFRAGAN BISHOPS | Titulars in 1904 | Catholics | Priests | Churches and Chapels |
|---|-------------------------------|-----------|---------|----------------------------|
| QUEBEC | L. N. Bégin.... | 325,000 | 550 | 240 |
| Trois-Rivières | F. X. Cloutier... | 76,800 | 110 | 70 |
| Rimouski | A. Blais | 99,140 | 128 | 116 |
| Chicoutimi | T. Labrecque.... | 60,000 | 100 | 60 |
| Nicolet | H. Brunault.... | 83,824 | 118 | 62 |
| Préf. Apost. du Bas St Laurent | F. Blanche..... | 9,650 | 14 | 29 |
| MONTREAL | P. Bruchési.... | 435,000 | 640 | 220 |
| Saint Hyacinthe.... | M. Décelles.... | 115,000 | 230 | 220 |
| Sherbrooke | L. Larocque.... | 67,000 | 149 | 62 |
| Valleyfield | M. Emard..... | 65,000 | 139 | 39 |
| Joliette | J. A. Archam- beault | 65,000 | 86 | 42 |
| OTTAWA | J. Duhamel.... | 140,000 | 240 | 123 |
| Pembroke | N. Lorrain..... | 50,000 | 46 | 40 |
| TORONTO | D. O'Connor.... | 65,000 | 103 | 87 |
| Hamilton | J. Dowling..... | 50,000 | 60 | 55 |
| London | P. McEvay..... | 60,000 | 75 | 77 |
| KINGSTON | G. Gauthier.... | 45,000 | 51 | 69 |
| Peterboro | R. O'Connor.... | 50,000 | 59 | 97 |
| Alexandria | A. Macdonell... | 25,000 | 19 | 19 |
| HALIFAX | G. O'Brien.... | 55,000 | 66 | 86 |
| Charlottetown | G. McDonald.... | 52,000 | 45 | 45 |
| Saint Jean | T. Casey..... | 58,000 | 63 | 93 |
| Antigonish | J. Cameron.... | 75,000 | 85 | 85 |
| Chatham | T. Barry..... | 60,000 | 71 | 71 |
| SAINT BONIFACE... | G. Langevin.... | 65,000 | 150 | 151 |
| Saint Albert | E. Légal..... | 16,000 | 53 | 53 |
| Athabaska (V. Ap.) | E. Grouard.... | 10,000 | 10 | 10 |
| Saskatchewan (V. Ap.) | A. Pascal..... | 15,000 | 24 | 24 |
| VANCOUVER | B. Orth..... | 10,000 | 25 | 20 |
| New Westminster... | A. Dotenwill... | 25,000 | 45 | 45 |
| Mackenzie-et-Yukon (V. Ap.) | G. Breynat.... | 8,000 | 22 | 22 |

On the death of a bishop, the bishops of the province send a list of three names to Rome and the Pope chooses and names a successor. The bishop-designate cannot be consecrated before receiving his bull from the Holy See. He enters immediately on his functions without having to fulfill any civil formality, and the diocesans render their homage and obedience as to his predecessor. The State recognizes in him the rights of a civil corporation. He enjoys besides, the greatest liberty while regarding canonical rules, in nominating vicars, creating parishes, erecting churches and parsonages. Each vicar keeps a registry of births, marriages and deaths. In French-Canada the vicar has the right of tithes for his maintenance. This tithe in spite of its name is but a twenty-sixth part: it is raised on grain alone, and the tendency is more and more to pay it in money. No vicar is irremovable.

(b) Religious Communities.—There are to-day in Canada more than 20 communities of men, eight of Brothers, and 62 of religious. They devote themselves to various forms of charity, of teaching, to parochial ministry or to preaching. They include Sulpicians, Jesuits, the Oblate Fathers of Mary the Immaculate, the clerks of Saint Viator, Dominicans, Franciscans, Redemptorists, the Fathers of the Holy Cross, of the Company of Mary, Eudistes, Basilians, of the Holy Sacrament, and several others. The Brothers of the Christian Schools to the number of 600, have 36 establishments, and instruct 20,000 pupils. The Sisters are to be found in every kind of devoted work: hospitals, asylums, industrial schools, alms-houses, refuges, orphanages, in one word all the miseries that the crowded cities multiply find succor from them. Mention will be made only of the orders founded in Canada:

| NAMES | Diocese | Year of foundation | No. of Members | Houses |
|--|------------------|-----------------------|-------------------|--------|
| Congregation of Our Lady | Montreal | 1659 | 1445 | 121 |
| | Montreal | 1747 | 950 | 58 |
| Grey Sisters (divided since 1854) | Quebec | 1849 | 800 | 39 |
| | St. Hyacinthe... | 1840 | 160 | 12 |
| | Ottawa | 1845 | 560 | 30 |
| Sisters of Providence | Montreal | 1843 | 1660 | 78 |
| of Jesus and Mary | Montreal | 1843 | 1050 | 89 |
| of the Holy Cross | Montreal | 1847 | 582 | 33 |
| of Mercy | Montreal | 1848 | 150 | 7 |
| of Saint Anne | Montreal | 1850 | 830 | 54 |
| Servants of the Imm. Heart of Mary | Quebec | 1850 | 340 | 25 |
| of the Assumption | Nicolet | 1853 | 335 | 32 |
| Religions of the Holy Family | Sherbrooke | 1887 | 200 | 200 |
| of the Precious Blood | Saint Hyacinthe | 1861 | 200 | 70 |

(c) Universities and Seminaries.—There are three Catholic universities in Canada: Laval in Quebec, Laval in Montreal, and the University of Ottawa, founded by Monsignor Guigues. The first two comprise all faculties except sciences, Medicine, law, and letters have well endowed chairs. Theology has distinctive faculties in the great seminaries of Quebec and of Montreal, the last opened by the Sulpicians in 1840. The University of Ottawa has only the faculties of theology and arts. Secondary education is disseminated by 17 colleges in the province of Quebec, all affiliated to Laval University which alone confers university degrees. Young men destined for the priesthood prepare by two years of philosophy and four of theology. This preparation begins in a great seminary; that of Montreal has nearly 300 aspirants for the priesthood, that of Quebec over 100. There is besides, one at Halifax; and each religious community of men is endowed with an academy where dogmatic and moral theology, the Holy Scriptures, Patrology, Canon Law, Church History and the pastorate are taught. Those young priests who are most distinguished for their intelligence are sent by their bishops to Rome to the Canadian College, founded by the Sulpicians in 1888, where they follow courses given by learned professors of the Roman universities and return with the

degrees of Doctors in Philosophy, in Divinity, or in Canon Law. Consult: Castell Hopkins, 'Canada: an Encyclopedia of the Country,' Vol. V. (Toronto, 1898).

French-Canadian Catholics believe that they have been called by Providence to personate on American soil the rôle that France personated in the Old World. They look upon themselves as destined to fill a mission, and that mission the one that France has filled in Europe; to carry high the banner of the Catholic Church, and among races more inclined to positivism, maintain and propagate the instinct of disinterested devotion, and the worship of the ideal. Consult: Casgrain, 'Histoire de la Vénérable de l'Incarnation,' t. I. p. 95; Gailly de Taurines, 'La nation Canadienne,' ch. XXV., p. 280-291; Massom, 'Le Canada français et la Providence' (Quebec, 1875); P. Ragey, 'Une nouvelle France' (Paris, 1902).

A. FOURNET, P.S.S.

Professor in Montreal College.

Roman Catholic Education. See EDUCATION, ROMAN CATHOLIC.

Roman Catholic Emancipation, the abolition of those civil and ecclesiastical restraints to which the Roman Catholics of Great Britain, and particularly of Ireland, were once subjected. By the statutes of William III. Roman Catholics were forbidden to hold property in land, and their spiritual instructors were open to the penalties of felony; and although latterly these restrictions had not been enforced, they remained unrepealed in England until 1778. See EMANCIPATION, CATHOLIC.

Roman Empire, Architecture of the. The ancient buildings of the city of Rome had little influence over the wealthy nobles, the provincial governors, the newly enriched generals of the later republic. The old Etruscan system of building, with much painted terra-cotta and with rude sculpture of a type which must have seemed to them very provincial and very archaic, too, when contrasted with the works of Greek civilization, could all be disregarded by men who had learned in the school of that civilization what the elegance, the finish and the perfect technique of Hellenic artists could produce.

Yet this influence is not to be avoided in view of the fact that all trace is lost of the republican buildings of Rome except some masses of the old Servian wall, the substructure of the tabularium and the like, which have kept their places by sheer inertia and on account of their immovable mass. The business of every Roman invader of the Eastern lands was to bring away as much artistic plunder as practicable, and on his return home to build great public monuments in the Imperial City itself as nearly in the Greek taste as he could. This again is an inference, but is irresistible in view of the abundant remains which we have of the period from 150 to 50 B.C., and of what is said about the period by its own writers. We have less power of judging of the buildings built in the provinces under Roman direction at this early period. Probably those buildings were not numerous nor often important. It was not until the civil wars had been closed and the peaceful administration of the empire was assured, first under the Dictator Julius, and

then under his nephew, Perpetual Tribune and Perpetual Prince of the Senate, Octavius, that Roman buildings, properly so called, because constructed in accordance with the central authority on the Tiber, appeared in the different parts of the Mediterranean world. It was in 54 B.C. that L. Æmilius Paulus began his great basilica at the northeast of the Roman Forum and intended as a second forum—an enlargement of the public space for the meeting of citizens. Julius (murdered in 44 B.C.) began his basilica, which was finished by Augustus, who also cleared away older buildings and built and adorned a new forum north of the Forum Romanum. The Forum of Augustus, with a triumphal arch, was more splendid than anything that had been seen in Rome. It contained the magnificent Temple of Mars the Avenger (Mars Ultor), and was enclosed by a lofty wall of solid cut stone masonry to shut off the humble dwellings to the north and east from the stately architectural group. The enormous Sæpta Julia, a larger basilica than any that had existed before, was built far to the north of the Capitol, in what was then the Campus Martius.

From that time on the emperors and the Senate vied with each other in the extent and magnificence of their buildings in the imperial city. These buildings were of two marked and easily distinguished classes. One class was Greek altogether in its tendencies, in the character of its construction and its design. It consisted of columnar architecture altogether, the construction being as simple as the Greek temples of earlier times. They were all of trabeated or post and beam construction, and always flat-roofed, always depending upon their colonnades for their chief architectural effect. The other class of buildings was of a nature never before seen in the world, and of unexplained origin.

It is very probable that the Alexandrian Greeks, that is to say, the Greek builders, under the successors of Alexander, and especially in the wealthy seaport city named after him on the shore of Egypt, invented this system of buildings, or rather developed it from the earlier practice of the Western Asiatics, especially the Persians of the later kingdom. This system of building was dependent upon vaulting in solid shells, either bricks or small stones being employed with what is called the "bath of mortar," that is to say, with mortar used in a semi-liquid condition and in great abundance. The result of this system of masonry is a solid, uniform, homogeneous shell, whether in walls or in the vaulted roof. It was taken over by the Roman builders at an early period of the rebuilding of the imperial city, and yet it is not ascertained at what period the earliest monuments of this style appeared in the city of Rome. It has been noted that Vitruvius, writing under the government of Octavius Augustus, never alludes to it. To him, the only writer on building of the time whose works have come down to us, building is as simple a matter as it was to a Greek; he seems to have understood only walls of brick or stone and roofs of timber. It is not possible to assert that any buildings of the character described above earlier than the Pantheon exist in Rome or in Italy, and the Pantheon as we have it, that is

to say, the cylindrical tower roofed with a low cupola 140 feet in diameter, and the largest structure of that kind in the world, is of the reign of Hadrian (117-138 A.D.). Once adopted however, this system of building prevailed immediately all over the empire, not universally, but as it seems, in the way of the officially recognized style of building whenever a spacious interior was required. And it is noticeable that this building for the interior is practically a Roman imperial invention. No Egyptian, no Babylonian or Assyrian, no Greek builder would have thought of making the interior the chief object of his care. The exterior of the monument was its essential characteristic; the interior, as is clear from the plans of the buildings, came of the necessities of construction without any serious attempt to modify them to the service of the requirements. The Roman engineer, on the other hand, desired vast halls, wide as well as long and high, and grappled with the problem of roofing these by means of masonry vaults, with a determined and seemingly unconscious courage unique in the history of the building art. Once he had developed the system of building the cylindrical or the spherical vault by means of stones laid in strong cement mortar, it seemed to be as natural to him to plan a width of 80 or 85 feet and to roof cylindrical towers nearly twice as wide, as to build the halls of more moderate dimensions.

These different systems of building were combined by the Roman engineers with extraordinary simplicity of means and with perfect success. Thus a massive wall built of squared blocks of stone without mortar exactly as would have been the practice in a Greek town four centuries earlier, would be backed up by a wall of mortar masonry. Bricks were used to face walls of solid masonry with such perfect success that those walls, of all thicknesses from nine or ten inches to many feet, were thought for years to be brick walls, although there is no such thing as an ancient brick wall in the city of Rome, and the solid mass of small stones laid in mortar and faced on either side with triangular tiles of clay exists even in the thinner partitions. Colonnades of marble shafts, capitals and epistyles were built in front of and flanking temples and palace halls, which were vaulted in the true Roman style with rubble laid in mortar, and these alternating with halls built and vaulted with almost equal boldness in cut stone as in the famous Nymphæum at Nîmes, in southern France. In making these combinations the Roman engineers were led inevitably to the mingling of their principles of design, and as they were not swayed by the strong logical and artistic sense of the Greek peoples they used this mingling of styles without perfect harmony. Thus a building of the most solid construction with all its openings spanned by arches and its roof made by a gigantic and ponderous vault would be adorned within and without by columns and entablatures, just as if the whole structure were Greek in the simplicity of its build. In later times separate columns were used to give a real or apparent support to the abutment of the vault. Thus in the great walls of the Thermæ (see THERMÆ) the groined vaults springing from nearly square piers are really supported by the walls themselves, from which the abutments project and

are supported generally in the way of corbeling; but in every case a gigantic column of Egyptian granite or similar precious material, with a capital of gilded bronze is put in to carry the line of the vault to the floor, and to give a seeming support even to that which needs none. This is the serious fault of the Roman imperial architecture, its denial in the decoration of the actual constructive nature of the work.

The Roman engineers did not look to the building itself for their final architectural effect. They used with the greatest freedom many kinds of surface decoration, ransacking the empire for splendid materials and using labor and money for the procuring of magnificent adornment. Thus a great hall in a public building would be lined with precious marbles in great slabs for the lower part of the walls; above this might come stucco surfaces modeled and embossed in reliefs of great beauty, such as those found in a tomb on the Via Latina near Rome, and very recently in a room in the Farnese garden near the Tiber. Above this again a similar finish in stucco would be carried out with deeply sunken panels and much gilding. The floor of such a hall would be of mosaic, and the pillars, whether square or circular, and the great pilasters which backed the free columns, would be of the most costly material and in enormous blocks. It is not asserted, however, that the building was designed by one artist and the decoration by another. On the contrary, the original scheme provided for all the decoration which was to be added. It is this freedom of decoration combined with an elaborate study of the interior as the chief purpose of the building, that has made the Roman imperial buildings the models from which all more recent architecture has originated. A Greek temple would be of no use as a Christian church, or as a palace hall—as a place of meeting or as a shelter for many persons; but the Roman buildings, basilicas, palaces, thermæ, and private houses, were all especially fitted to be lived in and otherwise used. The people of the West took the Roman buildings as they stood for churches and residences and buildings of state and official life; and as they built others, modified them from Roman practice only as their greatly diminished resources compelled them to do. A poor mediæval community could not build as a Roman proconsul built; the 6th century building had to be cheap and poor, with low, thin walls and a wooden roof: but still the Roman type was kept in view. In this way the Latin architecture of Italy, that of the earliest churches, took shape and was succeeded by the Romanesque (see ROMANESQUE ARCHITECTURE) for all of Europe except the Balkan Peninsula and the countries north of it. In the East another course was followed. The Roman civilization, and some part of the wealth and readiness to spend money which characterized the great empire, were retained in the empire of the East, and under these different conditions and with the powerful influence of Persia close at hand, the Byzantine architecture has lingered in the East until the present day, taking a different and generally inferior form in the hands of the Mohammedan race (see SARACENIC ARCHITECTURE), but preserving its original character where Greek Christianity has prevailed. In Western Europe, on the other hand, the

Romanesque architecture grew into Gothic; and the neo-Classic architecture followed in the 15th century, as a combination of the forms and structure which the Gothic art had made familiar to Europe, with a system influenced and largely controlled by the study of classical Roman art.

Of all the methods of architectural adornment, sculpture was the most remarkable; and the Roman architectural sculpture was a great contribution to the world's possessions of noble fine art. As early as the dictatorship of Julius, there existed in Italy a school of sculpture quite different from any matured by the Greeks. The great Altar of Peace, begun in 13 B.C. to commemorate the establishment of peace in the Mediterranean world, included a great amount of exquisite sculpture, both architectural and in the form of portrait statues. Under Trajan the art assumed a very dignified and truly architectural form, as in the reliefs of the Arch at Benevento and the still more admirable compositions preserved in the Lateran Museum at Rome. Under Marcus Aurelius large and showy reliefs recorded the transactions of his reign. The sculptures here named are all in marble, but the beautiful stucco reliefs must also be included in any examination of the sculpture of the 1st and 2d centuries.

Roman Law. The time of Justinian represents the beginning of Roman jurisprudence, for while laws had existed since the days of Romulus, it was during his reign and by his direction that civil jurisprudence was at last digested in the Code, the Pandects, and the Institutes.

Originally the government of Rome was in the hands of an elective king, a council composed of nobles and an assembly of the people. Matters concerning war and religion were administered by the supreme magistrate, and he alone had power to propose laws, his suggestions being debated in the Senate, and, finally, submitted to the several parishes of the city for ratification or

rejection. Among the most famous ancient legislators were Romulus, Numa, and Servius Tullius. It was to Romulus, for example, that Rome owed its first laws concerning marriage, the education of children, and the authority of parents; from Numa it obtained its law of nations and of religion, while from Servius came the civil code which balanced the rights and fortunes of the seven classes of citizens, and provided for the protection of contracts and the punishment of crimes. Later these laws were codified under the title of *Jus Papinianum*, but the work has long been lost, fragments only having been found by archaeologists.

Wise as many of these statutes may have been they were not destined to last for long, and when they became both odious and obsolete they were succeeded by the Twelve Tables, a digest that was received with such blind reverence for authority that all young Romans were compelled to commit it to memory. For centuries this stood as the "fountain of justice," and it is possible that there would have been no change for centuries to come if the new laws had not become such an intolerable grievance, permitting an almost complete divorce between law and equity. Conceived by the genius of Caesar, it remained for Hadrian to find the solution to the difficulty in the compilation of the code which, known as the Perpetual Edict, long remained the standard of civil jurisprudence in Rome.

During the four centuries that elapsed between the day of Hadrian and the reign of Justinian both public and private jurisprudence were molded by the will of the sovereign, and the custom of placing his decision on the same level as the maturely deliberate acts of the legislature resulted in the adoption of so many general and special laws that obedience might be said to have become an impossibility, until, at last, the question of the will of the sovereign was fixed by the framing of the Gregorian, the Hermogenian, and the Theodosian codes. The last named laws were compiled by a commission of eight persons appointed by Theodosius the Younger in 429, but were not published until 438, when they were established as substitutes for all the existing codes made since the reign of Constantine.

In A.D. 527, when Justinian ascended the throne, he found that the reformation of Roman jurisprudence was a labor that could no longer be postponed. During ten centuries the laws and the legal opinions that had become statutes were so numerous that they filled many thousand volumes, making it impossible for anyone to obtain, to say nothing of digesting, all of them. Judges were, therefore, often compelled to exercise their own discretion in the absence of any known law, while citizens in general were practically in absolute ignorance concerning the laws that governed them. The new Code, the Pandect, or digest, and the Institutes, or elements, were prepared by the most eminent scholars, who worked under the direction of Tribonian, a man whose versatility of knowledge can be compared only to that of Bacon. The entire compilation was completed in three years, and the ancient statutes were at once abandoned as relics of antiquity. This code was simply a digest of the previous codes of Gregorianus, Hermogenianus, and Theodosius, and the Constitutions, Rescripts, and edicts which had previously been issued, and is of importance in that it contains much ancient church history and law.

ROMAN RELIGION — ROMANCE

Roman Religion. So composite was the body of the religious beliefs of the Roman people, and so complex the elements themselves of which this composition was formed that it is impossible to name any definite source from which it may have come. It consisted of a mass of mythological traditions and customs which may be traced back, in many instances, to several common localities. These beliefs were introduced from time to time by the various peoples who formed the successive accretions to the great Roman people, and who in every notable instance brought with them into the nation their national religious beliefs, contributing part of them at least to the permanent structure of the Roman religion. And yet there are certain native elements which may be regarded as distinctively Latin, while, on the other hand, these elements themselves are nearly always paralleled in some one, or even in several, of the foreign components. To the influence of the Greeks more than to any other people the Roman religion is indebted for its structure and general complexion. And yet it will be seen that it differed from that religion in fundamental, vital respects.

Regarding Komulus and his immediate successors as the primitive founders, it will be found that distinctive contributions from the Sabines were added to the beliefs of the early settlers, and these later supplemented by the Latin and the Etruscan. The host of lesser sources can not be stated with any degree of accuracy. As hinted above many of the Latin gods bear a striking similarity to the Greek—a fact accounted for by a common origin. Thus we have the Latin Saturn, god of seeds, fruition, akin to the Greek Kronos; and Ops, wife of Saturn and goddess of earth and plenty, akin to Rhea, wife of Kronos; Jupiter, and Juno, who might be related to the Greek Zeus. More distinctively Latin are the wood gods, Faunus and Fauna; Janus, Diana, the goddess of the hunt; Vesta, the goddess of the hearth (flame); Vulcan, the god of flame (the smithy); Fortuna, the goddess of fortune and of chance. The list is too long for enumeration. Deities which may be named as of Sabine origin are the war gods, Mars and Quirinus, the latter being more particularly a god of strife; Sol, Luna, and other gods of the heavenly bodies. Tellus, the god of the earth, was Latin, while Feronia, the goddess of the soil, was of Sabinian origin.

The Romans had a separate god, or more often sets of gods, for everything. Besides all the greater deities corresponding to the Greek beliefs there were gods and goddesses for all the lesser acts and conditions of life, for every material thing. Thus from their supreme representatives, Jupiter, Juno, and Minerva, to the Lares and Penates, the gods of the household, there was an endless procession of deities of every grade and power.

Worshipping at first directly and freely to these gods themselves the Romans maintained in their religious dealings with them a somewhat Norse-like independence. A god was to be worshipped for the good he would do one. Greater his return to his votary the greater the worshipper's respect and belief. The Roman struck a bargain with his god; for so much good done him he worshipped the god so much. If the god proved powerless the worship was withdrawn.

From this fine freedom in his religious belief characteristic of the simplicity, the noble democracy, of the earlier days of the Roman people, there grew, coincident with the luxurious decadence of the empire, grave abuses which finally corrupted the entire tissue of the religion. There had been no priests at first. Only the fewest and simplest of attendants were devoted to the service of the gods. But gradually there were continual additions to these, until during the last days of the empire all that remained of the former religion was the groveling superstitious mysticism, zealously kept alive by avaricious priests, who levied for existence on the popular prejudices, debased morals, and superstitious fears. It was against such a state as this that the Apostle Paul took up his labors and against which Christianity finally prevailed, the last official recognition of the old beliefs going down under the proclamation of Constantine the Great, whereby the Christian religion was declared to be that of the state (312 A.D.).

Roman Steelyard. See BALANCE.

Roman Walls, four great walls built by the Romans in Great Britain. The first of these stretched from the Frith of Forth to the Frith of Clyde. It was built by Agricola in 80 A.D. In 83 he strengthened it by another wall, and in 139 Lollius Urbicus again built over the same ground, the wall being known as the wall of Antonius. These walls were built to keep back the northern barbarians, who in the form of Picts and Scots continuously menaced Roman rule in Britain. Hadrian, concluding that the walls of Agricola were insufficient for this purpose, built in the early part of the 2d century the famous wall that stretched between New-castle on the Tyne and Solway. This wall, finished in 120 A.D., was 68 miles in length, and marked the northernmost limits of Roman territory in Britain after that date. It is known as the wall of Severus, since that ruler strengthened it in 209 by building a parallel wall a few yards above it. Consult Bruce, 'Roman Walls' (1855).

Romance', a fictitious narrative in prose or verse, the interest of which turns upon incidents either marvellous or uncommon. The name is derived from the class of languages in which such narratives in modern times were first widely known and circulated: these were the French, Italian, and Spanish, called the Romance Languages (q.v.). The treatment here given must omit any extended mention of certain isolated romances in the later Greek. A well-known example of such is 'Apollonius of Tyre,' at one time widely read in the west of Europe; transmitted to England, first probably in a Latin version, it was soon translated, and was employed by Shakespeare for the plot of 'Pericles, Prince of Tyre.' Nor can the limits of the subject admit of discussion of some few Latin works sometimes classed as romances, such as the 'Golden Ass' of Apuleius, of which use was made in 'Don Quixote' and 'Gil Blas.' For such, see articles on individual titles and authors, and the general articles on the Greek and Latin literatures. For general consideration the subject may be restricted to the Middle Ages. The finest of these romances still extant are of the 12th and 13th centuries. They may be divided into two classes—the popular epics

(*chansons de geste*) chanted by the jongleurs and other strolling minstrels; and the more elaborate and artificial poems composed by troubes and recited before aristocratic audiences.

The materials of both classes were more ancient lays of celebrated heroes, mingled frequently, especially in the German romances, with pagan myths, together with long connecting passages composed by the minstrels themselves. Hence originated a series of epics grouped around some renowned hero, and forming a cycle of romance. To the first class belong the German heroic poems and the Carolingian chansons; to the second the Arthurian legends.

Of the collection of the ancient German lays made by Charlemagne, nothing remains except perhaps the fragment of the alliterative 'Lay of Hildebrand,' now in the Cassel Library. It is supposed to have been written in the 9th century or even earlier. All the other manuscripts of German heroic poems are of much later date; none of them are earlier than the 13th and most of them belong to the 14th or 15th centuries. Of the 'Nibelungenlied' (q.v.) there are three copies belonging to the 13th century. In this epic Dietrich plays an important part; but the poems devoted to the simple Dietrich legend are only found in late transcripts or early printed editions, probably little later than the date of their actual composition. They represent, however, older lays, and these again still older, of equal or even greater antiquity by two centuries or more than the Cassel fragment. The language changed considerably in the course of these centuries, and the poems must have been entirely recast, rhyme being substituted for alliteration; but the change in the legend itself is immaterial. It can be traced in the Latin chronicles of the 10th and 11th centuries, and also by means of the 'Vilkina Saga,' an Icelandic prose work of the 13th century. These poems, as well as others on similar subjects, range from a few hundred to several thousand lines in length. Some of them were modernized by Caspar von der Röhn, and inserted in his 'Heldenbuch.' The completest collection is that in Heinrich von der Hagen's 'Altdeutsche Heldenlieder' (1855). Another poem closely connected with the Nibelungenlied is the Latin epic of Walter of Aquitaine, attributed to Ekkehard I., abbot of Saint Gall, who died in 973, and is said to have written it as an exercise in his youth. It is obviously a translation from a German poem, and is found in several manuscripts, none of them perhaps older than the 12th century. The 'Klage' ('Lament'), said by W. Grimm and others to be a poem of the 12th century, forms a sort of conclusion to the great German epic; and another poem, 'Biterolf,' is ascribed to the same unknown author. It extends to 13,000 lines, and contains a great number of daring adventures, in the course of which Dietrich encounters and vanquishes Siegfried. 'Gudrun' is a fine epic of nearly 7,000 lines, and is of not much later date than the 'Nibelungenlied.'

We can only mention the names of the poems which make up what has been called the Lombard sub-cycle, namely, 'König Ruther,' 'Wolfdietrich' (including 'Hugdietrich'), and 'Ot-nit,' which latter furnishes the materials for the French poem 'Huon de Bordeaux.' Frederick Barbarossa was a great admirer of Charlemagne, and collected all the accredited records of that

monarch. He patronized the minnesingers as the German representatives of the troubadours. At his great Mainz tournament were assembled not only the knights of Germany and France, but the poets also. Among those present was Heinrich von Veldeke, who imitated the 'Roman d'Eneas' in his 'Eneit,' an example quickly followed by the chief leading epic poets of Germany. Heinrich completed his poem at the Wartburg, the residence of Hermann, landgrave of Thuringia; and many other translations, among others that of the 'Roman de Troie,' were executed there shortly afterward. Another guest of the landgrave's was Wolfram von Eschenbach, author of 'Parzival.'

The *chansons de geste* form an interesting body of literature. The oldest of them are of great length, consisting generally of 20,000, 30,000, or even as many as 56,000 lines, grouped in sets (*tirades*) of from 20 to 200 lines, all ending with the same assonantal rhyme. Up till the middle of the 12th century the lines were of 10 syllables, but lines of 12 syllables, ending in consonantal rhymes, were gradually substituted. The romances were sung to the sound of a kind of violin (*vielle*), played with a regular bow. Many of the minstrels (*jongleurs*) were poor, wandering on foot from village to village, singing in the ale-houses, or at the public fairs and games; some were soldiers, such as Taillefer, who struck his first blow at Hastings. Later they became mere mountebanks. A number of them wrote their own chansons, while others bought them from their original authors, and adapted them to the taste of their audience. When a jongleur had thus procured a copy he took care to conceal it from his rivals. A few of such copies, little weather-beaten volumes, are still preserved, a noted example being the Oxford manuscript of the 'Chanson de Roland.' It was to the poets of northern and central France rather than to the troubadours of Provence that these poems were due. The *chansons de geste* are divided into three cycles—that relating to Charlemagne and his peers, the Arthurian, and the classical. The more antique the Charlemagne romances are the more they are devoted to the emperor, who is represented more as a majestic king and valiant knight than as the statesman we recognize him in history to be; at times he is depicted as being easily duped, avaricious, and capricious. Among such works are 'Girard de Viane'; 'Ferabras' or 'Fierabras'; and the 'Chanson de Roland.' The centre of the entire structure is the 'Arthurian Cycle.' In the lays of the Welsh bards, supposed to be as old as the 6th and 7th centuries, although no manuscript extant is of earlier date than the 12th century, Arthur and his companions are celebrated, but temperately, the element of the miraculous being absent. It is in the 'Historia Britonum' of Abbot Nennius (apparently written in Welsh in the 8th century, and translated into Latin afterward) that the legendary additions begin to develop. Of three or four centuries later date are the so-called 'Armorica Collections' of Walter, archdeacon of Oxford, from whom Geoffrey of Monmouth professes to translate, and in which the supernatural and marvellous elements largely prevail. The 'History' of Geoffrey was versified in French (1155-8) by Wace, a son of one of the Conqueror's followers. The 'Brut,' as this met-

rical setting is called, contains about 15,300 eight-syllable lines, and adds a few details to the story of Arthur which do not seem, however, to have been Wace's own invention. The work was translated into English, and further amplified, by Layamon, about 1204. The 'Brut' of Layamon is composed of nearly 32,250 alliterative lines, or rather half lines. One of the most prolific of the Arthurian poets is Chrétien de Troyes (born about 1140).

One of the finest of the early French Arthurian romances 'Tristan' or 'Tristram,' was adapted by Gottfried of Strasburg, who left his 'Tristan und Isolot' slightly incomplete, about 1210. Other poems belonging to the cycle are the 'Morte Arthur,' a fine alliterative work of the 14th century; a Latin 'Life' of Merlin, in 1,529 hexameters, written about 1217; 'Li Biaux Desconneus,' a narrative of the adventures of Gligain, son of Gawain, written by Renauld de Beaujeu about 1200, and imitated by Wirnt von Gravenberg in his 'Wigolais' (about 1212). From France the Arthurian romance spread also into Provence, Spain, Italy, and the Netherlands, and was again transplanted into England.

The last of the cycles are the *classical*, in which the subjects are Alexander the Great and the Trojan heroes. The materials for the Alexandrine poems were found in an old Greek romance, written in Alexandria between 100 and 300 A.D., and known as the 'Pseudo-Callisthenes,' which was long read as authentic history, and of which there is still extant two Latin abridgments belonging to the 9th and 10th centuries. The most important romance on this subject is 'Le Romans d'Alixandre,' written by Lambert li Tors and Alixandre de Bernay in the 12th century; it contains upward of 20,800 12-syllable lines. This was the chanson that established the whole sub-cycle, and first brought the Alexandrine line into vogue and gave it its name. It concludes with the testament of Alexander and the lamentations of his 12 peers. Many French poets continued the subject. Consult: Paris, 'Histoire Poétique de Charlemagne' (1865); Grimm, 'Deutsche Helden-sage' (1867); Goedeke, 'Deutsche Dichtung im Mittelalter' (1871); Cox and Jones, 'Popular Romances of the Middle Ages' (1871-2); Rhys, 'Studies in the Arthurian Legend' (1891); Paris, 'La Littérature Française au Moyen Âge' (2d ed. 1890). See also FICTION.

Romance, or Romanic, Languages, those modern European languages which owe their origin to the language of ancient Rome—the ancient spoken language, not the language of classical literature. The common or vulgar speech of the ancient Latin peoples, the *lingua rustica*, differed as widely from the language of Cicero, Virgil or Livy as does the dialect of Yorkshire or of the Scottish lowlands from the literary English of to-day: it had in a measure its own vocabulary, its own pronunciation, its own grammar and prosody. This vulgar tongue was in fact the primitive Latin speech before Latin began to be used for literary purposes, and some of the widest differences between classic Latin and the modern Romanic languages are discovered existing in the extant remains of archaic Latin speech. A glance at a page of literary Latin is enough to convince any one of the frequency of such terminations

of words as *us, um, am*, etc., none of which are ever seen in Italian or Spanish: in the most ancient specimens of Latinity that exist the final *s* and *m* are very frequently dropped; and there is strong reason for the inference that in common speech, even in classical times, not only *s* and *m* but other consonants—*t, d, and r* were either dropped or feebly pronounced: this is what we see in the French language. Again, words in common use among the early Romans, but which were obsolete in the Augustan age, reappear in the modern Romanic languages; examples: in ancient Latin speech *bucca* signifies mouth, but in literary Latin it signifies the puffed-out cheek: in the modern Romance languages the word derived from *bucca* means mouth; *minaciæ*, obsolete in the Augustan age, is revived in Italian, French, English, etc. (menace); obsolete *vitellus* reappears in French *veau*, English veal; *caballus*, nag, is the original of the word for horse in French, Spanish, etc. Though obsolete as regards literary use, such words lived on in the vulgar speech and so became current in the language of the Roman colonies everywhere. But this *lingua rustica*, called also in the Middle Ages *lingua romana*, to distinguish it from literary Latin speech, underwent great modifications and changes when it became the common speech of the Gallic, Germanic or Slavic peoples among whom it was introduced by the Roman conquerors, or who adopted it after they had overturned the Western empire. Thus arose the modern Romance languages, which are chiefly seven, namely: Italian, Spanish, Portuguese (with which is usually classed the Gallego, or language of Galicia), Provençal, French, Ladino (or Romansch) and Rumanian: the dialect of the Catalans is regarded as the southern Provençal: in all of these Romanic languages except the Rumanian, the principal foreign element is Germanic or Gothic: in the Rumanian language it is Slavonic.

Romance of the Rose, a celebrated allegorical poem, one of the most important literary compositions of the Middle Ages. It consists of two parts, the first part, comprising about 4,000 verses, was written before the middle of the 13th century by Guillaume de Lorris, and the other some 50 years later by Jean de Meung: this contains nearly five times as many verses as the first part. It is a poem of love, but it is also a satire on contemporary manners and a curious repertory of miscellaneous erudition. Guillaume de Lorris, in the introductory lines of the poem professes to set forth the whole art and mystery of Love in allegory, and the Rose is "the sweet guerdon of love": but commentators were pleased to give this not very obscure intent of the poet a mystical turn, and interpreted the Rose as signifying the divine gift of Wisdom, or the soul's state of Grace, or the state of Eternal Bliss, or even the Virgin Mary. The commingling of allegorical romance with social and political satire, history, science, economic theory, and in short with such encyclopædic erudition as existed in that age, offends the modern literary taste and is exceedingly tedious reading; but it suited exactly the taste of its time, and for more than two centuries was a classic.

Romanes, rō-mān'ēz, George John, English scientist: b. Kingston, Canada, 20 May 1848; d. Oxford 23 May 1894. He was graduated in 1870 from Caius College, Cambridge, in 1874-6 worked under Burdon Sanderson in the laboratory of University College, London, and carried out important researches in nervous excitability. In 1879 he was elected fellow of the Royal Society, and in 1878 published, under the pseudonym "Physicus," a work entitled 'A Candid Examination of Theism,' in which he took up a somewhat defiant atheistic position. Subsequently his views underwent considerable change; he revised the 'Candid Examination,' and toward the close of his life was engaged on 'A Candid Examination of Religion,' in which he returned to theistic beliefs. His notes for this work were published after his death, under the title 'Thoughts on Religion,' edited by Canon Gore. Romanes was an ardent supporter of Darwin and the evolutionists, and in various works sought to extend evolutionary principles to mind, both in the lower animals and in man. He wrote very extensively on modern biological theories. His chief remaining works are: 'Animal Intelligence' (1881); 'Scientific Evidences of Organic Evolution' (Nature Series, 1882); 'Mental Evolution in Animals' (1883); 'Jelly-fish, Star-fish, and Sea Urchins' (1885); 'Mental Evolution in Man' (1888); 'Darwin and after Darwin' (1892-5); 'Examination of Weismannism' (1893); 'Mind and Motion, an Essay on Monism' (1895). In 1896 appeared a volume of 'Essays,' a selection from his 'Poems,' and his 'Life and Letters.'

Romanesque Architecture. The term is applied to any style which is assumed to have grown up immediately from the attempt of mediæval people to build as the Romans of the empire built: but it is generally used for the round-arched styles of Central and Western Europe, from the 6th to the 12th century, and as excluding the Byzantine style of the Balkan Peninsula. It is also very common to exclude the earliest Christian churches of Italy (see *BASILICA*; *CHRISTIAN ARCHITECTURE*). The word Romanesque is not very ancient, and its original meaning is rather "romantic" or "fantastic": but it was applied to architecture in imitation of the French use of the term *Roman* (fem. *Romane*), which was introduced into architectural terminology about 1835, and exactly in this sense, that is, to denote the pre-Gothic, round-arched architecture of Western Europe. Previous to that time the English writers had applied the word "Norman" to all round-arched English buildings except those few which they supposed to be of pre-Norman origin, and which they called "Saxon" or "Anglo-Saxon"; and as for the architecture of the Continent, such terms as "Lombard" and "Early Italian" were used, also "French Round-Arch" style, "German Round-Arch" style, and the like, or, in imitation of the German writers, "Byzantine," even when applied to buildings in the North. The term Romanesque is said to have been proposed by William Gunn, a clergyman and antiquarian, who died in 1841. It was taken up by better known writers, such as Whewell and Benjamin Webb.

The characteristic of the Romanesque style is the almost universal employment of the round

arch, and of constantly repeated attempts to use arched construction also in roofing churches and palace halls. The history of building in France and Germany from the 9th to the close of the 12th century is a constant series of attempts to vault wider and still wider aisles and naves, and the constant failure of those vaults, which either fell in ruins or needed to be tied and braced afterward in different ways. This came largely from the inferior mortar which was used, but, in general, from the poverty of resources of the small communities, secular and religious, and of the barons and princes of the time. Very little power of employing skilled labor existed, nor was there much skilled labor to engage; and, moreover, the means of transport were extremely inadequate, so that stones, however unfit for the purpose, had to be taken from the nearest quarry, and mortar had to be made up of such materials as were readily at hand. From this inadequacy of resources comes the constant use of heavy walls and deep-set windows, which in turn add a peculiar charm to this style. The church buildings might have been more permanent but for the constant attempt of the builders to raise the clearstory walls high above the aisle roofs, in order to secure large windows in the clearstory for the lighting of the whole interior. The higher these clearstory walls were made the more dangerous was the vault which they were to carry, and this because of the comparative difficulty of buttressing that vault when it reached a considerable height. There was also the desire to terminate the church at the east end with one or more semicircular apses, and as the churches grew larger and the aisle to be carried around the apse concentric with the inner and higher semicircular compartment, the difficulty of vaulting this aisle became almost insuperable. It was out of this twofold necessity that Gothic architecture arose, the startling innovation of the vault depending upon the ribs for their security having changed all the conditions of the problem (see *GOthic ARCHITECTURE*).

Romanesque architecture lingered the longest in Western Germany because magnificent cathedrals had been built and were building along the Rhine in this style. The cathedrals of Mainz (Mentz, Mayence), of Speyer (Spire, Spires), Trier (Trèves), and Worms, and the great churches of Saint Michael at Hildesheim, and, at Cologne, of Santa Maria, in Capitolio, of the Apostles, and of Saint Martin, show a magnificent and complete system of church building founded on the round arch and on cylindrical vaulting, which had a strength sufficient to resist the Gothic innovation for a long time. In Central France there remains a whole series of churches roofed by cupolas circular in plan, rising from square compartments by means of pendentives. This type must be thought to have come from the Byzantine through Venice; there belong to it the cathedral of Angoulême, and the churches of Gensac, Roulet, Souillac and of Saint Front at Périgueux, which last, however, has undergone a ruinous restoration. Further south is the cathedral of Le Puy (Puy-en-Velay), a round-arched church of great beauty and picturesque effect: but indeed the whole centre of France contains churches of this character, either perfect or in a much altered state.

The especial glory of the French Romanesque is in its exquisite sculpture. Such churches as the Abbey Church at Vézelay, the cathedral of Angoulême, the Church of Notre Dame La Grande, at Poitiers, and in the South, Saint Trophime at Arles, and the never finished church at Saint Gilles, display a wealth of sculpture unequaled at the time and never approached in its value as architectural decoration except by the Gothic sculpture of the next century. There is also a curious use of polychromatic effect in the external walls at this period. Especially in the centre of France a kind of mosaic of sandstone of different colors is used freely in large parts of the church; a good example being Notre Dame du Port at Clermont-Ferrand.

The Romanesque of Italy is represented by such admirable churches as San Zeno at Verona, San Miniato on the hill near Florence, the remarkable cathedral at Modena and, for the latest period, Sant' Ambrogio at Milan and San Michele at Pavia. There are also several superb Romanesque churches at Lucca, including the cathedral; and at Pistoja, north of Florence, three most interesting churches adorned with horizontal bands of black and white. This system of coloring is rather common, and is retained until the later or Italian-Gothic period. These churches are sometimes as rich in sculpture as the French buildings of the same period.

In England the style is far less elaborate and rich, but has an especial charm for those who know the long nave of Ely, the transept of Winchester and the nave of Peterboro Cathedral, or the admirable round church of the Temple in London and that of the Chapter House at Bristol.

The Low Countries are not rich in Romanesque architecture, but Belgium possesses in the Cathedral of Tournai one of the most magnificent Romanesque churches of which we have any record. The choir indeed has been rebuilt in a later style, but the crossings remain complete, with four lofty towers surrounding a central spire-like roof and a long nave with two stories of round arches.

RUSSELL STURGIS.

Romanino, Girolamo, jê-rô-lâ'mô rô-mâ-nê'nô, Italian painter: b. Brescia about 1485; d. there 1565. He was a pupil of Feramola in Brescia and between 1509 and 1513 lived at Padua and Venice, where he studied the rich golden coloring of Giorgione, and learned the art of reproducing it in his own works. After completing (1519-20) four frescoes in the cathedral at Cremona, he returned to Brescia. All his pictures are remarkable for their skilful composition and splendid coloring, but in his

later works his tones become silvery, clear and cold and lose the warm lustre of Giorgione's sunset tints. He painted many altar-pieces, of which the most remarkable are 'Madonna and Child' and 'The Madonna with the Dead Christ' (in Berlin Museum); 'Adoration of the Infant Christ' (in the London National Gallery, a good example of this painter's manner); 'Nativity' (in the Church of San Giuseppe at Brescia); and an 'Assumption' (in the Church of Sant' Alessandro, Bergamo). He also painted some frescoes in the castle of Malpaga, near Brescia, the home of the famous Colleoni, the commander of the Venetian armies. There are some fine portraits by Romanino to be seen at Brescia.

Romanoff, rô-mă'nôf, the name of the reigning family in Russia, founded by Michael Feodorovich Romanoff: b. 1598; d. 1645. He was descended through his grandmother from the family of Ruric, the founder of the Russian empire, and came to the throne in 1613 by election of the boyars and the higher clergy. The early part of his reign was troubled by the Poles and by turbulent nobles. Western civilization gained an entrance into the country, and many foreigners, particularly Scotchmen, became naturalized. France tried to disturb the commercial monopoly of England in Russia. Michael was succeeded by his son Alexis and the male succession of the Romanoff family continued until the death of Peter II. in 1730, when the crown devolved upon Anne, Duchess of Courland, and continued in the succession of the female Romanoffs until the death of Elizabeth in 1762. The latter was succeeded by her nephew, the son of the Duke of Holstein-Gottorp, who ascended the throne as Peter III. and established the present dynasty of Romanoff-Oldenburg.

Romans, Epistle to the, one of the epistles of Saint Paul, the genuineness of which is as a whole undisputed, though the last two chapters have been suspected by some critics to be spurious. The Romans to whom it is addressed would seem to have been mostly Gentiles converted from heathenism to a judaizing form of Christianity. It is plain from the epistle itself that these judaizing Christians, whether of Jewish or Gentile blood, were already separated from the strictly Jewish community settled in Rome. The epistle was written from Corinth just before the year 58 A.D., which was the beginning of Paul's captivity. The argument of the Apostle is directed against the efforts of some teachers in the Christian community at Rome to enforce on the Gentile believers the obligations of the Mosaic law. These Judaizers maintained that to abandon the law was to proclaim license to sin: to which Paul replies that the sole and sufficient law of Christians is that they shall lead a new life in fellowship with Christ: this fellowship makes the new life possible: the law only commands, but gives not strength to obey. The argument is so full of allusions to and quotations of the Jewish law, both moral and ceremonial, that in the opinion of many critics those to whom the epistle is addressed must have been, not Gentiles, but Jews by race: hence the suspicion entertained regarding the genuineness of the last two chapters, in which it is plainly implied that the majority

ROMANTICISM

of 'those "Romans" were indeed Gentiles, not Hebrews.

Roman'ticism. The word "Romantic" is derived from the old Romanic or Romance languages, which were formed by a fusion of Latin as spoken by the common people of Italy with the native tongue of the northern barbarians who invaded that country. This Romance speech naturally assumed a variety of forms, but it reached its highest development in Provence, in southern France, where it became an important instrument of popular literary expression, especially during the 11th and 12th centuries. The compositions which appeared in this vernacular tongue were generally tales and ballads in which the adventures of knights in pursuit of honor, or in devotion to the Christian religion, or the enthusiastic deeds of chivalry, and the spirit of loyalty and reverence for women were portrayed. Another mark of this literature is the evident fondness for events that are strange, mysterious, and supernatural. The name "romance" then, first applied to the language in which those compositions were written, came afterward to refer to the prevailing characteristics which they displayed, as contrasted with the works written in Latin, which were termed "classical." During the 18th century, which delighted to term itself the "Augustan Age," and prided itself upon its purity and refinement of taste, the classical models and modes of expression were regarded as furnishing the only correct standards, while the literature and art of the Mediæval Period was regarded as barbarous, and the whole mode of thought and life to be characteristic of Dark Ages that were unworthy of the attention of a cultivated man. At the close of this century, however, and during the early decades of the 19th, a marked change manifested itself in the whole tone and tendency of the intellectual life of the time. This mental revolution, which is known as the Romantic Movement, affected all departments of thought, and all artistic and literary standards and modes of expression. From the first this movement showed a consciousness of its opposition to the generally received intellectual conceptions and prevailing artistic and literary standards of the time, though this contrast was less violently emphasized in England than in Germany and France. Goethe noted and commented upon the difference between the old tendency and the new, describing it as equivalent to that between the "diseased" and the "healthy"; while Schiller contrasted them as the "naïve" and the "sentimental." It was Friedrich Schlegel who first employed the terms "classic" and "romantic" to characterize this opposition. Since that time many writers have undertaken to define and explain the fundamental distinctions between these tendencies, especially as they express themselves in art and literature. The following points appear to be most significant: (1) The main marks of classicism are simplicity, directness, and nobility and perfection in achievement. In a classic work of art, there are no evidences of a lack of harmony between the ideas and the medium, no suggestion of something remaining that cannot be expressed. As a consequence, the personality of the artist is not expressed, the artist is lost in his work, which stands impersonal and objective. He does not show us his own attitude toward the subject-matter, his emo-

tional struggles and the play of his life. The Romanticist, on the other hand, puts himself into his work; it is no disembodied idea of beauty that he seeks to express, but his own personality, the longings, hopes, and ideals of a spirit that has a tendency toward the infinite, and which therefore can never express itself in any finite and objective medium. Classicism is thus always definite, objective, and complete, while Romanticism is always touched with subjectivity, and thus with a suggestion of incompleteness, which is due to the fact that it seeks to convey the mystery of spirit for which no objective mode of expression is adequate, and which therefore can only be symbolized and vaguely suggested. (2) As Romanticism endeavors to express what is strange and mysterious in the life of spirit, it naturally seeks its material in the past, and feels itself especially in sympathy with the Middle Ages, when the aspirations of the spirit, its love of adventure, and sense of the mysterious expressed themselves in quests for the Holy Grail, in crusades, and gallant deeds of chivalry and knight-errantry. Thus a sympathy with the past, a new interest in humanity as such, marks Romanticism. (3) Just because classicism sought to express the idea of beauty in definite and objective form, it was possible to lay down fixed canons of procedure and so to render the result formal, precise, and almost mechanical. Romanticism, however, aims to represent what is inner and subjective, and therefore necessarily protests against making art stilted and formal by the application of external rules and mechanical standards. Art, the Romanticists declare, must spring from the untrammelled expression of the free spirit of the man of genius. "The will or caprice of the poet," as Schlegel says, "admits no law above itself."

The Romantic Movement.—The romantic movement may best be understood if we regard it as a part of the general intellectual revolution of the 19th century, and as one in spirit with the historical and scientific spirit of modern times. The entire spiritual attitude of modern life, as contrasted with that of the 18th century, may be characterized as a new consciousness of infinite possibilities and boundless aspirations. The spirit knows itself as infinite, and is also conscious of the infinite task set for the individual through its own demand for expression and realization. The new tendency turns away in disdain from the mechanical conceptions and formal syllogisms in which the 18th century had self-complacently summed up the universe, it laughs to scorn the unintelligent and formal imitation of classical models that bases itself on ancient canons; it denounces the ethical principle of prudence; it declares that the infinitely mysterious law of life cannot be comprehended by the principle of self-love; it refuses to believe in a transcendent God. The new movement is thus romantic through and through, filled with a sense of mystery and wonder, with the love of adventure and discovery, and with the buoyant spirit of aspiration. As Wordsworth says: "In that dawning age 'twas bliss to be alive, but to be young was very heaven." This tendency to advance to new achievements manifested itself in many and various directions. In philosophy, it led to a new and fruitful attempt to comprehend in more adequate terms

God, nature, and the place and significance of man's life in the universe. The result of this is seen in the systems of Kant and the German idealists. On another side, the new interest in man and the affairs of man's life has given rise to the modern historical movement which has made its influence felt in every department of intellectual life. It is this historical interest, united with the Romantic spirit of adventure and discovery, that is the assertion of the confidence of Reason in itself, that has called into being the evolutionary sciences of nature. The concept of evolution has transformed the older view of nature, just as it did our view of man when it was earlier applied to illumine his social, ethical, and religious life. For evolution is just an attempt to explain the world by showing the relations between things as parts of a single process. It therefore always emphasizes organic relationships, and views things as parts or stages in a dynamic process, instead of taking each thing as something static, which exists in isolation as something in itself independent, and having only external relations to other things. The Romantic movement in art and literature must also be regarded as an expression in different fields of essentially the same intellectual and spiritual attitude that is shown in these other spheres of activity.

Romanticism in England.—In England a new spirit was perceptible in literature soon after the middle of the 18th century. This new movement, however, was not so intense or so fundamental in scope as its counterpart in Germany, which began a little later. For the introduction of a natural literature into England, expressing a sympathy with nature and an interest in the past, while disregarding the rigid canons of the Augustan Age, was in a way but the restoration of the healthy natural traditions that had expressed themselves in Chaucer and Spenser, in Shakespeare and Milton, and in the folk-songs and ballads, which were collected and edited by Thomas Percy in his 'Reliques of Ancient English Poetry,' in 1765. It was thus not marked by the keen sense of opposition to the prevailing system that characterized the tendency in Germany, and at a later time, also in France. Moreover, perhaps for this very reason, it did not penetrate so deep into the spiritual life of the people, or show its effects in all departments of intellectual life, as in Germany. It appears mainly as a literary movement, with which is connected some new tendencies in painting, and also as a revival of interest in Gothic architecture, which Horace Walpole did much to promote. But the movement did not involve a fundamental transformation of philosophical and scientific conceptions. This transformation came about at a later period during the 19th century, and was largely the result of the influence of German thought as represented by Coleridge and Carlyle, aided by Darwin's discovery and applications of the doctrine of evolution. The names of Gray, Cowper, and Burns, are usually placed among the English Romanticists, as well as those of Wordsworth, Coleridge, Southey, Byron, Shelley, and Keats. A little later we have the revival of interest in Dante, which culminates in the Pre-Raphaelite movement.

The Romantic School in Germany.—Lessing stands as the first to challenge the canons of the classic art and literature. Herder is at

once the pioneer of the modern historical method and one of the first to appreciate the value of what is natural and spontaneous in literature. Influenced no doubt by the publication of Percy's 'Reliques,' he made a collection of the folk-songs of Germany. In Goethe's 'Werther' and Rousseau's 'Confessions' we have two books of nearly the same date that show many of the marks of extreme Romanticism. The name of "Romantic school," however, is usually applied to a group of men whose main centre of activity was first at Weimar and Jena and afterward to some extent at Berlin and whose work extends from about 1775 or '80 to 1806. The main names of this school are the brothers Friedrich and A. W. Schlegel, the philosopher Schelling, Novalis (whose real name was Friedrich von Hardenberg), Ludwig Tieck, and the theologian Schleiermacher. The main result of this movement was philosophical and æsthetic, though it led to some important results in the way of historical investigations. Another group of men—Uhland, the brothers Grimm, von Arnim, J. Görres and Brentano, who represent a more distinctly literary movement with strong national characteristics—are often called the younger Romanticists, whose centre of activity was at Heidelberg, where their organ, the 'Zeitung für Einsiedler,' was published.

Romanticism in France.—We have seen that Rousseau may in a sense be called one of the earliest Romanticists. As a result of the Revolution and the prolonged Napoleonic wars, literature received little attention in France during the years that were most fruitful in Germany and England. Chateaubriand and Mme. de Staël are sometimes said to be the forerunners of Romanticism in France. But the tradition of classicism was strongly entrenched, and even Victor Hugo at first adhered to this standard. But in 1826 in the 'Odes and Ballads,' and in the following year in the preface to the play entitled 'Cromwell,' he declared his allegiance to Romanticism, and at once became the leader in a new cause into which he threw himself with all the fervor of his enthusiastic nature. Besides Hugo, the principal French Romanticists are Alf. de Musset, Ch. Nodier, George Sand, Th. Gautier, and Balzac.

J. E. CREIGHTON,

Professor of Philosophy, Cornell University.

Romanus I., rō-mā'nūs, **Lecapenus,** Byzantine emperor: d. Island of Protea 948. He served in the imperial navy, and was in command of the Byzantine fleet on the Danube in 917, when hearing of the defeat of the army at Achelous,

he at once set sail for Constantinople. His designs on the throne were furthered by his popularity with his sailors and the people, and after the marriage of his daughter, Helena, to Constantine VII., he rose steadily in power, and in 919 was crowned colleague with his son-in-law. He exercised so much influence over the latter as to make him the real ruler until 944, when Constantine, aided by the sons of Romanus, caused him to be carried off to the island of Protea, where he was forced to become a monk, while Constantine was proclaimed sole emperor.

Romblón, rōm-blōn', Philippines. (1) A province consisting of a group of islands in the Visayan Sea, lying east of Mindoro and south of Luzon; they are near the centre of the archipelago, and the most northern islands of the Visayan group; area, 515 square miles. The northern islands of the group form with the islands of Mindoro and Marindique clear, deep channels, much frequented by Philippine boats; the islands are also indented with well-sheltered inlets and bays. The majority of the inhabitants of the province are Visayans; some Negritos are found on the island of Tablas, and Manguians in Tablas and Romblón. Civil government was established in 1901. Pop. 55,339. The islands constituting the province are as follows: (a) Bantón, the most northerly island of the group; the surface is rugged except in the south-east; the soil is sterile, and few crops are raised; the chief industry is the mining of gypsum, an excellent quality of which is found; area, 11 square miles; (b) Carabao, the most southern island of the province; its chief physical characteristic is a central cone-shaped summit, from which the land slopes regularly to the sea; it is heavily wooded, but not inhabited; area, 19 square miles; (c) Dos Hermanas, two islets of rock, separated by a channel two miles in width; area, one square mile; (d) Maestre de Campo, the most western island of the province; it is circular in shape, and mountainous with steep shores; it contains one small village on the east shore; area, three square miles; (e) Romblón, the third island in size, giving its name to the group on account of central location and mineral wealth; (f) Sibuyán, the second largest and most eastern island of the group (see SIBUYÁN), and (g) Tablas, the largest island (see TABLAS).

(2) An island of the province of Romblón, lying midway between Sibuyán and Tablas, on the route of steamers passing through San Bernardino Strait and Verde Passage; area 50 square miles. A central mountain range traverses the island from north to south, with spurs extending toward east and west. The chief occupation of the people is cattle raising; valuable deposits of quartz, marble, and slate are found and quarried; the marble is exported in large quantities. This island is the seat of government for the province.

(3) Pueblo, capital of the province of Romblón, situated on the northwestern coast of the island of Romblón, the largest town of the province. It has an excellent harbor, one of the best of the Visayan group; and is the commercial centre of the island. It has some old fortifications originally built to defend it from pirates. Pop. 6,764.

Rome, Ga., city and county-seat of Floyd County, picturesquely situated at the junction of

the Oostanaula and Etowah rivers, which at this point form the Coosa River. It is situated 72 miles northwest of Atlanta, 195 miles northeast of Selma, Ala., and 73 miles southwest of Chattanooga. Rome is on the Chattanooga, Rome & Columbus branch of the Central Railroad of Georgia, the Alabama division of the Southern Railway, the Georgia division of the Southern Railway, the Rome & Decatur division of the Southern Railway and the Rome Railroad division of the N. C. & St. L. Railroad. Both the Coosa and Oostanaula rivers are navigable.

Public Buildings.—Rome has many modern business blocks, handsome churches, and public buildings. Shorter University for Women is here located. It also has a United States post-office and court-house, besides opera house, fine school buildings, and national and state banks.

Industries.—There is a large and increasing trade here in cotton manufacturing and general merchandise. In the city and contiguous thereto are numerous cotton mills, planing mills, furniture factories, iron foundries, plow works, ice mill, cottonseed-oil mill, sash and door factories, and other smaller industries. The assessed property valuation of Rome is over \$6,000,000.

Government.—Rome was incorporated as a city in 1847, and is governed by a mayor and city council. It has an electric light plant and waterworks, and 12½ miles of street railway system.

Population.—The population in 1870 was 2,748; (1880) 3,877; (1890) 6,957; (1900) 7,291; (1902) 10,825. Including its suburbs, it had in 1904 at least 15,100 population.

Rome (Ga.), Engagement at, and Capture of. When Gen. Sherman was closing in on the Confederate army at Resaca he ordered Gen. Garrard to move with his cavalry division from Villanow toward Rome, to cross the Oostanaula and operate on Gen. Johnston's flank. On 16 May 1864, after the fall of Resaca, Gen. J. C. Davis' infantry division was ordered down the west bank of the Oostanaula to support Garrard, and Garrard was further ordered to leave his artillery at Farmer's bridge, eight miles above Rome, in charge of Davis, who was to rejoin his corps at Kingston, while Garrard made a rapid movement on Johnston's flank. Davis made a march of 15 miles on the 16th, and bivouacked a few miles from Farmer's bridge. Meanwhile Garrard had, on the 15th, driven the Confederate cavalry from Farmer's bridge, and pursued to within sight of Rome, but the force developed proving too large to engage, he returned to Farmer's bridge, on his way to Lay's Ferry, where he met Davis on the evening of the 16th. Davis determined to continue on to Rome, which, when he arrived there on the 17th, was held by two Confederate brigades. At 5 P.M. the Confederates advanced and drove in his skirmishers. Davis now brought up his entire division, deployed two brigades and held one in reserve. A severe contest ensued, which continued until dark, when the Confederates withdrew to their works and Davis threw up intrenchments. On the morning of the 18th he ordered an advance, and found the works in his front abandoned. He occupied Rome, capturing ten guns, valuable iron works and machine-shops, and a large amount of public stores.

His loss was about 150 killed, wounded, and missing; the Confederate loss, about 100 killed and wounded.

Rome, Italy, the capital of the kingdom, as formerly of the Roman republic and empire, the Papal See, and long the religious centre of Western Christendom, is one of the most ancient and interesting cities of the world. It is traversed from north to south by the Tiber. Modern Rome embraces the ground, occupied by ancient Rome, on the left bank, besides an extended portion on the right, added during the rule of the Popes. A large part of the modern city stands on the flat plain known as the Campus Martius. The ancient city was enclosed by a wall, which at first embraced only the Palatine Hill, was built by Romulus, and had three gates. The second wall, attributed to Servius Tullius, enclosed all the hills, which gave to Rome the name of the City of the Seven Hills. This wall was built of huge blocks of stone without mortar. The third wall, the Aurelian (3d century), was built by the emperor whose name it bears, and had a circuit of about 11 miles. It had towers and bastions and 14 gates. It was not until the 17th century that Rome attained its present limits by a wall built under the pontificates of Urban VIII. and Innocent X. The walls are of brick and stone, and about 55 feet high, with 12 gates and several railway passages. The improvements of the modern city are suggestive of the new thought and practical endeavor of the age, yet the charm of beauty and dignity still lingers around the ruins and monuments of the ancient city. Extensive excavations have revealed interesting antiquities; those of the Forum Romanum and the Via Sacra; the remains of the temple of Saturn and of Castor and Pollux, the temples of Vespasian, of Antoninus and Faustina, the temple of Vesta, etc. Numerous villas and palaces and countless works of art have also been discovered. The Roman Forum lies between the Capitoline and Palatine Hills, and extends from the arch of Septimius Severus to the temple of the Dioscuri. It was surrounded by magnificent palaces, temples and basilicas. The Forum was originally a place where markets and courts of justice were held. It was open on one side and on the other was divided into corridors or halls containing the Exchange. This part was subsequently occupied by basilicas and temples. In 472 the Forum began to be the place of assembly of the Comitia Tributa. In the time of the Republic, public banquets and gladiatorial combats were held in the great Forum, which also contained various monuments, chief of which was the Columna Rostrata, erected in memory of the victory over the Carthaginians. The rostra, from which public orations were delivered, formed the boundary between the Forum in its limited sense and the Comitium. The Forum was under the Republic the centre of Roman political life. The Via Sacra was the main central street, skirting the Forum on one side, and passing by the Palatine to the arches of Titus and Constantine on to the Appian Way, the streets of tombs. The principal streets and squares of modern Rome

are the Piazza del Popolo on the north side near the Porto del Popolo, containing a fine Egyptian obelisk, from which diverge three of the great thoroughfares, the Corso, leading directly for one mile to the Piazza di Venezia, near the Capitol; the Via di Ripetta, which winds its course into a maze of ancient streets, and Via del Babuino, leading to the Piazza di Spagna, then further to the Quirinal, and passing through a tunnel, opens on the Esquiline; the aristocratic quarter lies between the Corso (lined with elegant modern palaces) and the Esquiline. Above the Piazza di Spagna, and approached by a noble flight of steps, is the Piazza de Trinità in front of the church of the same name, built by Charles VIII. in 1494. This eminence is the Pincio, the "hill of gardens," one of the historical seven hills, now a favorite promenade and once the site of the celebrated Gardens of Lucullus. The view thence of Rome is fine. The shaded walks are adorned by busts of celebrities. At the foot of the wall lies the Villa Borghese, containing objects of great interest, with its beautiful park, adjoining which is the Villa Medici, whose museum contains some rare antiquities. Other squares are: Piazza Barberini adjacent to the Palace; Piazza Colonna in the centre of the city, with a column of Marcus Aurelius, and nearby the Piazza di Monti Citoria, on which stands the Chamber of Deputies and other government offices; the Piazza San Pietro with its artistic colonnade, in front of Saint Peter's, and the Vatican; Piazza di Navona with a fountain and two churches. From Via Ripetta, two minor streets radiate, one to the Via Nazionale, the great business thoroughfare of the modern city and bordered by imposing and elegant buildings. From the Piazza del Indipendenza the Corso Vittorio Emanuele extends to the Piazza delle Terme and the ruins of Diocletian. All the railway lines converge at the Piazza dei Termini. The Via Cavour runs parallel to the Via Nazionale from the Station to the Capitol. The Piazza del Campidoglio in front of the Capitol contains the perfect equestrian statue of Marcus Aurelius, so celebrated as having Michelangelo's special regard. Other squares are the Piazza di S. Agnes, a martyred saint; Piazza di Navonna, containing the famous statue, a noble Greek work, of Pasquino (hence the term "Pasquinades") where for a long time satires of the day, directed against the Pope or nobility and prevalent follies, were posted; the Piazza di Montanari, where from time immemorial peasants contracted with land-owners for the season's farm-work. The Via Venti Settembre contains the immense palace of the Treasury, the war office, the Scotch church and school, many fine new edifices, and the British embassy, with its grand, old garden, the last remnant of the gardens of Papal Rome. In the new quarter, embracing the Esquiline, Viminale and a portion of the Pincian Hill, besides the Indipendenza, are the Piazzas di Dante, Vittorio Emanuele, Esquilino, Guglielmo Pepe, etc. Of the historical hills, the Capitoline, crowned with historical sites and fragments, claims our first attention. Upon it stands the modern Capitol, over the ancient Tabularium, which contained the tables of the laws, and is believed to have communicated with the Ærarium in the temple of Saturn. "The beautiful Tarpeia," says Nie-

buhr, "still sits sparkling with gold and jewels, enchanted and motionless, in a cave in the centre of the hill." Thus the ancient Mons Tarpeia remains the treasure of art, the wonder of history. On the Capitoline, Numa founded a temple of Fides Publica and another to the god Terminus. Under Tarquinius Superbus, 535 B.C., was built the Temple of Jupiter Capitolinus, with money taken from the Volscians in war. This sumptuous fane had peculiar claims on the veneration of the Roman citizens—it was citadel and shrine, combined. The Sybilline books were preserved there. There both Titus and Vespasian celebrated their triumph over the fall of Jerusalem. It was later robbed of its treasures during invasions of the Vandals. Near it stood the temple of Fides and the twin temples of Mars and Venus Erycina. The temple of Jupiter Tonans was built by Augustus; the temple of Honor and Virtue by Marius in 103 B.C., with spoils taken in the Cimbric wars. There were still other notable temples, and the Altar of Jupiter Pistor, commemorating the stratagem of the Romans, who threw down loaves into the camp of the besieging Gauls to deceive them as to the state of their supplies. On this hill Petrarch received his laurel crown, and the tribune Rienzi promulgated new laws. Michelangelo designed the present Museum and Palace of the Conservatories, under Pope Paul III. (1544-50); Pius IV., Gregory XIII. and Sixtus V. added the sculptures, etc. At the foot of the Capitol is the ancient church of Ara-Coeli, the building at the back of the piazza is the Palace of the Senator, built by Boniface IX. (1389), but altered by Michelangelo. The ornamental fountain at the foot of the double staircase was erected by Sixtus V. The tower of the Capitol contains the great bell of Viterbo, taken in war; the view from this high point is superb. On the east side of the piazza is the Museo Capitolino, containing one of the finest collections of statuary and painting, and the famous mosaic, Pliny's Doves, found in the ruins of Hadrian's Villa near Tivoli. In "The Reserved Cabinet" stands the exquisite Greek statue Venus of the Capitol, found imured in a wall upon the Quirinal. In the Hall of the Emperors is the imposing seated statue of Agrippina (grand-daughter of Augustus); and 83 busts of Roman emperors, empresses and their families, a character study. Many of them are important as works of art. The Hall of Illustrious Men is interesting, as is also the Hall of the Faun, from the Faun found at Hadrian's Villa. The statue of the Faun is highly graceful and artistic. The three gems of the collection are found in the Hall of the Dying Gladiator, the Dying Gladiator, the Antinous of the Capitol, and the Faun of Praxiteles. On the west side of the piazza is the Palace of the Conservatories, which is to receive all the recently discovered antiquities. It contains busts of artists by Canova, the restoration of a column of Michelangelo, many fine frescoes and reliefs by Bernini and other masters; the Apollo Belvedere and the famous Bronze Wolf of the Capitol, of unknown antiquity. Near the wolf is the well-known and beautiful figure of the boy extracting a thorn from his foot. The Picture Gallery of the Capitol contains few good works: a beautiful Saint Sebastian by Guido, and several others by Guercino.

At the head of the Capitol steps, to the right of the terrace, stands the Palazzo Caffarelli, the residence of the German minister; the view commands the Forum and ruins as far as the Colosseum and to the Alban Hills beyond, where every stone has its story, from the Arch of Septimius Severus to the colossal Amphitheatre, embracing the remains of temples, arches, and royal palaces. The eight Ionic columns standing are a part of the temple of Saturn. At the right side of the Forum the remains of the Basilica of Julia, begun by Julius and completed by Augustus Cæsar, and just beyond are the three beautiful columns which belonged to a temple of Castor and Pollux, 484 B.C. Here costly sacrifices were offered and Roman knights richly decorated and crowned with olive, passed in military procession. The entablature supported by these columns is very rich and considered one of the finest specimens of Corinthian extant. On the right the Via Fienili branches off, leading to the Circus Maximus, with a capacity for 25,000 people (used for hunting wild beasts). The Palatine Hill, quite near, was the pivot of Rome's history, where the Pelasgic fortress was enclosed by Romulus, and where Augustus was born. This was the site of the Palaces of the Cæsars, pompous and magnificent beyond description. The temple of Apollo, of white marble, was the resort of poets. Close under the Palatine is the temple of Vesta, founded by Numa. Near was the Regia, whence Cæsar went forth to death. Adjoining the Basilica Julia is the Column of Phocas, sung by Byron. On one side of the Forum stood the Tabernæ Argentariæ, silversmiths' shops, and in front of Saint Adriano, beyond the Taverna Nuova, Virginia was stabbed by her father. The front of Saint Adriano is a fragment of the Basilica of Æmilius Paulus. This Basilica occupied the site of the famous Curia of Tullus Hostilius. The three gigantic arches still farther are all that remains of the Basilica of Constantine, one of whose classical Corinthian pillars was incorporated by Paul V. in Saint Maria Maggiore. Mediæval remains exist in a group of interesting churches in the vicinity. Little remains of the once superb temple of Venus and Rome, except a cella, countless fragments of columns, and a mass of Corinthian cornice facing the Colosseum. This was the last pagan temple which remained in use in Rome. Near the church of Saint Francesca the Via Sacra passes under the Arch of Titus, the most beautiful monument of its kind remaining in Rome, erected by the senate to commemorate the taking of Jerusalem. The gardens of Adonis, where Sebastian endured martyrdom, border an adjacent lane.

Between the Arch of Titus and the Colosseum the ancient pavement of huge blocks of lava remains. At the foot of the hill is the fountain where the gladiators used to wash. On the right the Via Triumphalis leads to Via Appia, first passing under the Arch of Constantine. This is the most striking of the Roman arches. The Colosseum or Flavian Amphitheatre was begun in 72 A.D. (12,000 captive Jews doing the work), and consists of four stories supported respectively by Doric, Ionic and Corinthian columns. Its circumference is 1,641 feet, length 287, width 182, height 157 feet, and it had the capacity to hold 100,000 persons. Its construction has been ascribed to Gaudentius, a Chris-

PIAZZA NAVONA, OR CIRCUS AGONALIS, ROME.

PIAZZA DEL POPOLO, ROME. ST. PETER'S IN THE DISTANCE.

tian martyr; it was used for gladiatorial combats, and those engaging were slaves or prisoners, or Christians who were compelled to fight wild beasts. Saint Ignatius was the first martyr here, devoured by a lion. Others were shot down by arrows, or exposed to every humiliation and torture. A cross marks the spot in the arena where Christians suffered. The upper arches frame a series of views of the Capitoline, the Cœlian, and the Campagna. Other triumphal arches not already mentioned are that of Severus and that of Drusus, 8 B.C. The Column of Trajan, very ornate in spiral bas-reliefs, illustrating the exploits of the emperor, by several thousand carved figures, and 117 feet high, is still standing. The Pantheon, by Agrippa, 27 B.C., a perfect specimen of classical architecture, is a temple to all the gods (now church of Saint Maria Rotonda) and the best preserved of all the ancient temples. It is circular in form and of remarkable construction, as regards its dome, by which it is lighted. The Catacombs are subterranean passages, extending many miles by winding passages underground, used as sepulchres and meeting places by the early Christians; niches in the walls of tufa were used to bury their dead. The passages are narrow, except occasionally when they open into wider spaces used for chapels of worship, and often frescoed. The decoration is characteristic and significant, usually representing Christian hope and doctrine. Pictures are frequently symbolic. A large collection of sarcophagi, pictures and inscriptions from the catacombs, are preserved in the Lateran Museum. The catacombs extend around the city in a wide circle; the most important are the Catacombs of Calixtus on the Via Appia; those of Domitilla or Saints Nereus and Achilleus; Saint Prætextatus, Via Appia; Saint Priscilla, beyond the Porta Salara; Saint Agnese, Via Nomentana; Saint Sebastiano, beneath the church of that name; Saint Alessandro; and the Jewish Catacombs and those of Mithras of the Via Appia.

Rome is par excellence the Mecca of artists, and both museums and Christian temples are the shrines of art. Rome is filled with churches, of which Saint Peter's ranks first. It was founded by Constantine on the site of the Circus of Nero, where Saint Peter suffered martyrdom, and is gorgeously decorated with gold mosaics and marble. Bramante, Raphael, and Michelangelo were the chief architects. Bernini filled it with the sculptures of his contemporaries and many monuments line the pillars and fill niches. The Pietà is one of the notable sculptures of Saint Peter's. The great dome is a marvel of architectural skill. The façade is 357 feet long and 144 feet high, and over the central entrance is the loggia, where the Pope is crowned and whence he gives his Easter benediction. Over the main entrance of the vestibule is the celebrated Mosaic of the Novicella (1298), by Giotto, and Cavallini. The magnificent central door of bronze is a remnant of the old Basilica (1431-9). The enormous size of statues and ornaments in Saint Peter's are deceptive as relates to the vast proportions of its interior, which is only realized by observing the moving, living figures of people. Around the shrine under the dome, 86 gold lamps burn continually. Wonderful mosaic pictures are

among the countless gems which enrich this noble temple. Its interior has the form of a Latin cross with chapels on the sides. Many princes of the church lie buried in the crypt. The Vatican, the present residence of the popes, is a vast collection of palaces, comprising the old and new palaces of the popes, the Sistine Chapel, the Loggie and Stanze, the picture gallery, museums and library. Raphael's wall frescoes rank above all his other work, and in the 'School of Athens' and 'Disputa,' the 'Transfiguration,' 'Driving Heliodorus from the Temple,' and other frescoes of the Stanze and Loggie, he evinces astonishing theological wisdom and philosophical erudition. Each stanza attests to his deep reflection and rich imagination; detail and general effect are equally studied, resulting in a perfect harmonious whole. In the Sistine Chapel, the 'Last Judgment' is Michelangelo's chef d'œuvre.

The Vatican Library contains 220,000 volumes and over 26,000 MSS. San Giovanni in Laterano, on a lonely site near the south wall, was built by Constantine, but has since been rebuilt, altered and extended by Giotto and others under various popes, and the high church councils are held there. Other churches are Santa Maria Maggiore, in whose construction antique bronzes, gold and marble from pagan temples were largely used, also beautiful mosaics of the 6th century. Santa Croce, erected by Saint Helena, the nave of which was borne by eight antique columns; Saint Clemente, the most perfect specimen of old basilica, contains frescoes by Masaccio; Il Gesu, the principal church of the Jesuits, with the façade and cupola by Giacomo della Porta, and whose interior is rich in marbles; Santa Maria degli Angeli, originally a part of Diocletian's Baths, transformed into a church by Michelangelo, an imposing church, contains an altar-piece by Muziano, and a fine fresco by Domenichino, and the tomb of Salvatore Rosa; Santa Maria in Ara Cœli, remarkable for its architecture and very old; Santa Maria in Cosmedin at the north base of the Aventine, remarkable for its Alexandrine pavement and its lofty and beautiful campanile of the 8th century; Santa Maria sopra Minerva, notable as the only Gothic church in Rome; Santa Maria in Dominica or della Navicella on the Cœlian, with 18 fine columns of granite and two of porphyry, and whose frieze of the nave was painted in Cambric by Giulio Romano and Perino del Vago; Santa Maria della Pace, interesting for its paintings, particularly the four sybils, considered among the most perfect works of Raphael; Santa Maria del Popolo, notable for its sculptures and paintings ('Jonah' by Raphael, ceiling frescoes by Pinturicchio, and mosaics from Raphael's cartoons by Aloisio della Pace); Santa Maria in Trastevere, an antique church, first mentioned in 449; and San Paolo fuori le Mura (on the spot where Saint Paul suffered martyrdom). In San Pietro in Vincoli is the celebrated 'Moses' of Michelangelo, by some critics regarded his best work of sculpture. The great baths or thermæ were peculiar features of the city and were used not only for bathing purposes, but for games and athletic sports, and contained assembly rooms, libraries, promenades, etc. The thermæ of Caracalla, Titus, and Diocletian were the most magnificent and largest. The great cloacæ (or

sewers) belonged to the Severan epoch. The Cloaca Maxima was the principal sewer. The aqueducts, built on rows of arches, thread the campagna for a distance of 60 miles, passing at times through hills and represent marvellous engineering skill. The Aqua Paola, Aqua Trajana and Aqua Marzia still remain, and contribute to the water supply of the city. Among the finest sepulchral monuments, the chief were the Mausoleum of Augustus in Campus Martius; that of Hadrian on the west bank of the Tiber, now the fortress of modern Rome, and known as the Castle of San' Angelo. The city was also rich in private palaces and buildings. The Naumachiæ were artificial lakes constructed for fighting naval battles. There are ten bridges across the Tiber, besides the railway bridge. The highest is the Ponte Margherita, opposite the Piazza del Popolo; the Ponte di Ripetta, in the place where the old ferry was, to "the farm of Cincinnatus." (This bridge leads to the new quarter.) The Ponte Umberto, leading to the newly erected Palace of Justice or law-courts on the right bank; the Ponte Sant' Angelo, ancient Pons Ælius, leading to the castle. Below it is a new trestle-bridge; and still below this is the iron suspension bridge; farther, the Ponte Gianicolo, Ponte San Sisto; Ponte Garibaldi; then the two bridges which cross the island in the Tiber. The Villa gardens are fast being replaced by tenement houses and new suburbs are springing up. The University of Rome or Collegio della Sapienza is an ancient institution; canon law and civil law, medicine and philosophy and philology are included in its curriculum. It possesses extensive laboratories, botanical gardens and an astronomical observatory. It is attended by nearly 1,000 students. The Collegio de Propaganda Fide is situated in the Piazza di Spagna; the Collegio Romano, adjacent to Saint Ignazio, is a lyceum, and now contains the Archaeological Museum and the recently established library, Biblioteca Vittorio Emanuele, combining the old Jesuit library with the libraries of suppressed monasteries, amounting to about 500,000 volumes. The Accademia de' San Luca, for the promotion of the fine arts, is composed of painters, sculptors and architects, and was founded in 1595. Connected with it are a picture gallery and schools of fine arts. There are numerous other institutions connected with art, music, science or learning, one of which the Accademia de' Lincei, founded in 1603 by Galileo and his contemporaries, is the earliest scientific society of Italy. Besides the libraries already mentioned, the chief are the Biblioteca Casanatense, the Biblioteca Angelica, and the Biblioteca Barberini. The American College was founded about half a century ago, is a school for priests and is composed of students who desire a post-graduate course in divinity, philosophy, rhetoric, metaphysics, etc. The students enjoy special privileges in the Vatican Library and museums and at all great church functions. There is also an American school of classical studies, under the auspices of the Institute of Archæology, whose work consists of archaeological research and study, and whose investigations often lead the students as far as Greece or Egypt, accompanied by the faculty. The Irish College is the oldest in Rome, almost hidden by the famous Palazzo Aldobrandini, once the residence of Cardinal Mazarin. Other

famous palaces are the Palazzo Barberini on the Quirinal, built by Urban VIII., almost wholly from materials taken from ancient buildings. In its small but excellent collection is the 'Beatrice Cenci' by Guido Reni—also valuable MSS. and some literary curiosities; the Palazzo Colonna near the centre of the city; the Palazzo Corsini in the Trastevere, once the residence of Queen Christina of Sweden, and containing precious MSS.; the Palazzo Farnese, near the Tiber, was inherited by the kings of Naples, but now belongs to the French government, and is occupied by the ambassador. The Spada Palace is one of the finest examples of the late Renaissance; the Palace Rospigliosi, near the Palace of the Quirinal, contains valuable art treasures. On the ceiling of a casino in its gardens is the beautiful fresco of the 'Aurora' of Guido—this is now the residence of the French ambassador to the Pope; the Palazzo di Venezia is adjacent to the principal Jesuit church. The government buildings occupying former church property are the Post-office in the ancient convent of Saint Silvestro, the Ministry of Public Instruction in the convent of the Minerva. The porticoes or colonnades were public places of recreation or for the transaction of business. Among the basilicas, one of the most beautiful was the Æmilian on the north side of the Forum Romanum, 179 B.C.; the Basilica Julia, recently excavated on the south side of the Forum, begun by Caesar, and the Basilica Porcia, the oldest, built by Cato, the censor. Recent excavations have thrown considerable light on the subterranean galleries, connected with the games held in the time of Cæsar in the Forum. It is clear that 12 elevators were used to deposit quickly the various parties of combatants. Equestrian statues were later placed above them. The square basement of Janus Medius, wells containing fragments of pottery, graves containing chalices, have also been discovered. Under the substructure narrow prison cells have come to light. At the foot of the Palatine were revealed the remains of an imperial palace, later transformed into a Christian sepulchre; also some prehistoric tombs. The ancient graffiti—that is the rough sketch or misspelled word scratched upon walls or columns by early Christians and thoughtless idlers, have solved many topographical problems of the ancient monuments of the "Eternal City." Among the Columns, the oldest was the Columna Mœnia, in honor of Mœnius who took the town in 338 B.C.; the Columna Rostrata, commemorating the victory over the Carthaginians 200 B.C. The most beautiful was that of Trajan in the Trajan Forum (described elsewhere), and a similar one in the Via del Corso near Palazzo Chigi. The most celebrated theatres are those of Pompey, Cornelius Balbus and Marcellus. The theatre of Pompey was adorned by the most beautiful Greek statues. It held 40,000 persons. The Colosseum as already described was the most magnificent amphitheatre. Hospitals of every description, some of which are richly endowed, are numerous. Church festivals are a special feature of Roman life, but the pomp and show of former times has somewhat diminished. External trade is unimportant. The chief manufactures are woolen and silk goods, artificial flowers, pottery, jewelry, mosaics, casts, and objects of art. Trade is chiefly in these articles,

2. Interior of Basilica of St. Peter's.

and in olive oil, pictures, and antiquities. Pop. (1901) 462,783.

History.—Legend, accepted as authentic in later Roman times, made Romulus (q.v.) the founder of the city of Rome, and the Palatine, one of the seven hills that rise on the left bank of the Tiber, the site of the first settlement. The entire period from the date of the foundation of the city, 753 B.C., to the establishment of the republic, 509 B.C., is in its detailed history unknown to us, and from the mass of myth and legend it is possible to derive the very broadest conceptions only of the beginnings of the Roman state. This is due to the fact that the authentic records of Rome date only from 390 B.C., the year of the destruction of the city by the Gauls. Tradition, then, speaks of seven kings who, including Romulus, ruled over the city for 243 years and assigns to each definite services rendered to the state. Romulus was the founder and conqueror; his successor Numa Pompilius, was a religious teacher; Servius Tullius, a political reformer and law-giver, etc. The last three kings, Tarquinius Priscus, Servius Tullius and Lucius Tarquinius Superbus, were of Etruscan origin, whereas the earlier rulers had come from Latin stock. With the overthrow of Tarquinius Superbus in 510 the Roman kingship comes to an end. A critical study of this legendary period makes all these names and the events connected with them doubtful, but preserves the general outline of development. Rome, in the modern view, is regarded as having had its origin in the union of three tribes, the so-called Ramnes, Tities and Luceres, of whom the first were of Latin blood, the second of Sabine stock and the third of doubtful affinity. The situation of Rome on the hills near the mouth of the Tiber was favorable for its development, and in the course of time the city extended its authority over the neighboring country until with the destruction of Alba Longa, the ancient religious centre of the Latin peoples, it came to assume a predominant position in Latium. The Etruscan character ascribed to the last three kings points to an Etruscan conquest, and indeed throughout the early period of Rome the influence of the Etruscans to the north is marked, especially in religious customs and in architecture. From the very earliest period the inhabitants of Rome appear to have been divided into two classes, the patricians and the plebeians or *plebs*, with whom probably may be ranked the class of *clients*. It was the patricians alone that constituted the state; the *plebs* had no political rights whatsoever. In fact early Rome should be regarded as consisting of two isolated communities, one comprising the original settlers or, possibly, the conquerors of the city, the other the conquered population and later immigrants, such as those attracted to Rome by the excellent opportunities for trade it offered. Not only was the political power in the hands of the patricians, but even the early Roman religion was largely in the nature of a narrow national creed to which the plebs could not be admitted. Inter-marriage between members of the *populus* and plebeians was forbidden. The patricians alone had the right to bear arms. Within the *populus* or state, the headship was vested in the *rex* or king, who combined in himself the functions of war leader, judge and priest, and was

assisted by a council of elders or senate. The Roman "people" was divided into wards, class or *gens*, and households. When assembled for the exercise of its sovereign powers it was known as the *comitia curiata*. A change in the relations between patricians and *plebs* was effected by a reform which legend ascribes to Servius Tullius. By this innovation the right of bearing arms was conferred on the *plebs*, and the entire free-holding Roman community was divided into five classes, on the basis of wealth. These classes were subdivided into centuries or "hundreds," and the entire military assembly of the inhabitants bore the name of *comitia centuriata*, which, instituted undoubtedly for purposes of national defense, soon came to exercise important political powers.

The expulsion of Tarquin was followed by long wars with the Etruscans and the Latin tribes, in the course of which Rome for a time had to contend for its existence. A great victory over the Latins in 496 led to the formation of a Latin Confederacy under the leadership of Rome. Thus strengthened the Romans fought successfully against the Æqui, the Volsci and the Sabines, and in 396 captured the Etruscan stronghold of Veii, which was followed by the subjugation of southern Etruria.

The place of the kings was taken after 509 by two consuls, elected by the *comitia centuriata* from the ranks of the patricians. The institution of the senate was retained and plebeians were admitted to membership, but all magisterial offices were closed to members of that order. The period that follows, therefore, is marked by a bitter struggle on the part of the plebeians for political and, to a degree, social equality. Wealth, too, became concentrated in the hands of the patricians and the distribution of the public lands was carried on entirely in the interests of the ruling class. Discontent was also fostered by the severity of the laws against debtors. In 494 the plebeian army, just returned from a victorious campaign, seceded to the Sacred Mount, near Rome, and threatened to found a city for themselves unless concessions were made. The patricians yielded and the office of tribune of the plebs was created for the defense of the interests of the lower order against the ruling class. These tribunes, originally two in number, later increased to ten, were given the right of veto on the decisions of the consuls and the senate. In the course of the struggle for an equitable division of the public land, Spurius Cassius, a patrician who espoused the cause of the *plebs*, fell a victim to the vengeance of his caste (486 B.C.). The demand for a codification of the laws led to the appointment in 451 of ten Decemvirs who after two years' work brought forth the Twelve Tables in which the entire system of public and private law was embodied. The act of violence attempted by Appius Claudius, head of the Decemvirs, on the plebeian maiden Virginia led to the overthrow of the Decemvirs in 449 B.C. Protected now against the arbitrary misuse of the law on the part of the patricians, the plebeians pursued with renewed strength the struggle for political and social equality. In 445 inter-marriage between patricians and plebeians was made legally valid. The consuls were supplanted by military tribunes with consular power who might be chosen from among the plebeians. After this the plebeian

conquest of offices proceeded steadily. The quaestorship was gained in 421 B.C., the dictatorship in 356 B.C., the censorship in 351, the praetorship in 337. After a ten years' struggle it was provided by the so-called Licinian Rogations (367 B.C.) that no citizen should own more than 500 *jugera* of the public domain and that the remainder should be distributed among the plebs in small allotments. The consulship was also restored and it was made obligatory for one consul to be chosen from the plebs. By the year 300 complete equality between the orders had been established. The termination of the contest between the two orders may be assigned to the year 286 B.C., when the Hortensian Law made any decree of the *Comitia Tributa*, wherein the plebs were predominant, law for the whole people, the so-called *plebiscite*.

The course of political progress during this period was sharply interrupted by the invasion of the Gauls who in 390 overwhelmed a Roman army on the Allia, burned the city and besieged the garrison in the Capitol. Legend ascribes the defeat of the Gauls to Camillus (q.v.), but in reality it was a large ransom in gold which induced the conquerors to retreat. The devoted patriotism of its citizens, however, restored the fortunes of the city; its houses were rebuilt, the attacks of the neighboring peoples, the Volsci, the Æqui and part of the Latini were repulsed, and within a short time Rome had more than regained its former power. With the establishment of internal peace, its career of rapid conquest begins. The Samnites, the most formidable rivals of the Romans, were defeated in three great wars (343-341, 326-304, 298-290) in the course of which Rome contended successfully against the united forces of the peoples of central Italy, aided in the last of the wars by the Gauls. A rebellion of the Latins was crushed in 338, the long struggle terminated in the complete subjection of the allies, and the inhabitants of Samnium, Picenum, Umbria, Apulia, Lucania and Etruria became the allies of Rome. In 280 war broke out with Tarentum, the most powerful of the Greek cities in southern Italy. Tarentum called Pyrrhus (q.v.), king of Epirus, to its aid. Subjected at first to defeat, the Romans ultimately drove Pyrrhus from Italy and took Tarentum (272). Rome was now mistress of central and southern Italy and had fought with success against the Gauls in the north. To make conquest permanent military colonies were planted in the subjugated territories and a great system of public highways was developed to facilitate communications. The incessant wars had made Rome a nation of soldiers, and now that there was no one to resist it in Italy, it turned its arms against a foreign power, and in the struggle with Carthage made the first beginning of its imperial career.

The early relations between Rome and Carthage were friendly and commercial treaties between the two nations had been concluded at various times. The contest between the two broke out in Sicily, of which the Carthaginians were masters in greater part. The first Punic War (264-241 B.C.) began with the invasion of Sicily by a Roman army. The strength of Carthage, however, was on the sea, and to cope with it, the Romans built a fleet with which in 260 they gained a great victory at Mycale. The fortunes of the war wavered for

a long time until a second victory off the Ægæan Islands in 241 brought Carthage to terms. Sicily was surrendered to the Romans who erected it into their first province, and Carthage pledged itself not to wage war on the allies of Rome. In 238 the Romans seized Sardinia and in the following year extended their sway over the Illyrian coastlands and upper Italy. Carthage, robbed of its island possessions in the Mediterranean, more than made up its losses in Spain, and in 218 B.C. the celebrated Hannibal (q.v.), son of Hamilcar Barca, the conqueror of the peninsula, renewed the contest with Rome (the second Punic war) by his attack on Saguntum, a city ally of Rome. Hannibal invaded Italy, overthrew the Romans at the Trebbia (218), on Lake Trasimenus, in the following year, and in 216 at Cannæ, where the rout of the Romans was complete. Rome, however, remained steadfast with Hannibal at its very gates, husbanded its resources and by carrying the war into Africa forced Hannibal to depart from Italy. In 202 the Carthaginian general was defeated by P. Cornelius Scipio at Zama, and Carthage signed peace giving up Spain to the Romans, dismantling its navy and paying an indemnity of 10,000 talents. The hatred of Rome, however, was not appeased, and when Carthage, after 50 years, showed signs of renewed strength, it was attacked and destroyed (146), after a siege of three years (the third Punic war). The Roman arms in the meantime had also conquered the East. Antiochus III. of Syria was defeated in 190 at Sipylos and deprived of his possessions in Asia Minor. Macedonia, after repeated wars, was made a Roman province in 146, and Greece, which had enjoyed the shadow of freedom for 50 years was reduced to the same condition, in the same year, under the name of Achaia, after Corinth, its most prosperous city, had been stormed and robbed of its art treasures. In 133 Rome fell heir to the dominions of Attalus, king of Pergamus, and the province of Asia was formed out of the territories thus acquired. The Roman rule in the Spanish peninsula was firmly established after two formidable insurrections, one led by Viriathus (148-140) and the other known as the Numantine war (133-133), had been suppressed.

Republican Rome was now at the height of its power, but the wars which had been crowned with such success abroad brought on evils within the state which were destined to destroy it. The task of governing a world empire and carrying on the great game of diplomacy by which that empire had in large measure been built up, naturally called for a more centralized and rapid exercise of authority than was possible with the cumbrous methods of the popular *comitia*. The power of the state gradually passed into the hands of the senate. There grew up at the same time a nobility of the robe, consisting of those who had enriched themselves as rulers of the newly conquered provinces which Rome for a long time regarded as subject territories merely and as fruitful sources of revenue. So wealthy had the state become, indeed, that in the second half of the 2d century B.C. the citizens of Rome were freed from all burdens of taxation, a measure which attracted to Rome a large population of idlers, which derived its chief sustenance from the largesses of the nobles who

ROME.

2. Interior of Saint Paul's.

found it necessary to court the favor of the mob. Throughout Italy the rich Roman office holders established vast landed estates, which were fast coming to be worked by slaves, and the poor farmers, ruined by this formidable competition, came in great numbers to Rome to swell the ranks of the propertyless. Between this great mass of poor proletarians and the small class of officials, senators and landlords, strife was in the nature of things bound to come, and it was this strife between the *Optimates* or the aristocratic party and the *Populares* or proletarians that, skilfully used by ambitious politicians, brought about the fall of the republic. Noblest of the popular champions were the brothers Tiberius and Caius Gracchus (q.v.) who wrested from the senatorial party an agrarian law favorable to the homeless masses and regained some of the ancient powers of the popular assemblies, but fell victims both to the hatred of their enemies (133 and 121). The war against Jugurtha (q.v.), which revealed the shameless corruption to which the ruling party had sunk, brought forth another popular leader in Marius (q.v.), whose reputation was increased by the splendid victories over the Cimbri and the Teutones in the years 102-101. Moderate at first in his views, Marius was driven, by the agitations of demagogues, to violence. In 90 B.C. the Italians rose in insurrection to enforce their demand for the rights of Roman citizenship, and though the allies were defeated it was deemed expedient to grant them their demands. The termination of this struggle, known as the Social war, in 88 B.C., was followed by a conflict between Marius and Sulla (q.v.), an adherent of the senatorial party, for control in the state, in the course of which both factions were guilty of dreadful excesses. In the year 81 the Marian party was finally overthrown, and Sulla, proclaimed dictator, enthroned himself in power by a bloody proscription of his enemies, and proceeded to revolutionize the constitution of the state so as to place the sole power in the hands of the senate and the aristocratic party. But neither senate nor people was thenceforth to govern in Rome. The example of aristocratic rule based on military force had been set by Sulla and the struggle between parties now passed into a struggle between individuals for control. Gnaeus Pompeius (q.v.) by his victories over Sertorius in Spain and the suppression of the servile insurrection under Spartacus attained immense popularity and this was increased by his readiness to make concessions to popular demands. After his triumphant campaigns against the Mediterranean pirates and Mithridates (q.v.) he was for a time master of Rome. The senate, however, stirred to an assertion of its rights by its successful course in the conspiracy of Catiline (q.v.) now set itself to oppose his will and Pompey, desirous of redeeming the promises made his veterans of allotments of land in Italy, joined with Gaius Julius Cæsar (q.v.) and Licinius Crassus (q.v.) to form the first Triumvirate which for a time was absolute in Rome (60 B.C.). Cæsar was a leader of the popular party and he aimed at becoming the sole power in the state. Crassus died in 53, and in 49 war broke out between Cæsar and Pompey. The former had under his command a splendid army trained by years of campaigning in Gaul and

Britain and in the battle of Pharsalia (48) Cæsar was victorious. Pompey fled to Egypt and there perished and the remnants of his party were wiped out at Thapsus in 46 and Munda in the following year. Cæsar was now undisputed master of the empire, but fell, after a short rule, beneath the daggers of Brutus and his associates, and his death was followed by the renewal of civil war. Gaius Octavius, Cæsar's nephew and adopted son, and Marcus Antonius, Cæsar's lieutenant, both aspired to be his successor, but joined in 43 with Aurelius Lepidus, in a second Triumvirate to overthrow the party of Brutus and Cassius. This was accomplished at Philippi in 42, and Octavius and Marcus Antonius, setting aside the weak Lepidus, divided between them the Roman world. But while Octavius governed his western realm with energy, Marcus Antonius gave himself up to the pleasures of Cleopatra's court. War broke out between the two and in the naval battle of Actium (31) the forces of Marcus Antonius were utterly routed. Antonius fell by his own hand and Octavius was left without a rival. With Actium begins the Roman empire.

Octavius made no change in the established forms of government. In 27 B.C. the senate conferred on him for life the government of all those provinces whose defense called for the employment of the military forces of the empire, together with the supreme command of the army and the title of Augustus. Successively Augustus united in himself the great offices of the state, the consulate, the tribunate, the headship of the sacred colleges. The senate was left with the splendid shadow of power, in reality the mere instrument of the emperor's will. The empire, and especially the provinces, found peace after a half century of civil strife and acquiesced in the rule of an autocrat whose sway was far more kindly than the selfish rule of an aristocratic oligarchy. Under Augustus the economic development of the empire made rapid progress; its parts were brought more closely together by increased means of communication; with peace came also rapid intellectual growth, and Latin literature had its golden age in the reign of Augustus. The boundaries of the empire were extended to the north by the campaigns of the emperor's stepsons Tiberius and Drusus, who carried their victorious arms to the Danube and beyond the Rhine. The last years of Augustus' reign were darkened by domestic unhappiness and the great disaster of the Teutoburg Forest where Varro's legions were annihilated by the Cheruscan chief Arminius. Augustus was succeeded in the principate by his stepson Tiberius (14-37 A.D.) who ruled ably in the beginning but hardened with time into a gloomy despot whose suspicions fell heavily on all those members of the nobility who might in any way become rivals for power. Living in retirement on the island of Capræ he left the government to powerful ministers, of whom Sejanus (q.v.) is the most celebrated. Caius Caligula (37-41) a madman and a tyrant, was murdered by his guards and was followed by Claudius (41-54) a good-natured dotard who was completely under the control of his infamous wives, Messalina and, after her, Agrippina. By the latter he was poisoned and Agrippina's son, Nero (54-68), succeeded to the throne. After giving the fairest promise for some years, the young

emperor, in spite of such advisers as Seneca and Burrus, entered upon a course of infamous excesses and mad escapades which disgusted alike the senate and the army and brought about a revolt before which Nero fled. Unable to escape he killed himself, the last of the Julian house of emperors.

Gaiba, Otho and Vitellius, military rulers all proclaimed by their respective armies, fell within the space of two years and were succeeded by Flavius Vespasianus (69-79), commander of the legions in the east. Vespasian introduced economy into the government, brought to an end the Jewish war by the storming of Jerusalem (70) and began the conquest of Britain. The brief reign of his son Titus (79-81) was marked by the eruption of Vesuvius which overwhelmed the cities of Herculaneum and Pompeii (24 Aug. 79). The reign of Domitian (81-96), a younger brother of Titus, was a period of oppression and intellectual stagnation. Cruel, despotic, half-mad Domitian resembled the last rulers of the Julian house rather than the great emperors whom he succeeded and by whom he was followed. Nerva (96-98) was succeeded by M. Ulpius Trajanus (98-117), under whom the empire attained its greatest extent. His campaigns north of the Danube resulted in the erection of the province of Dacia; Armenia and Mesopotamia were acquired and the Parthians were driven back from the Euphrates. Hadrian (117-138) had none of the warlike instincts of his predecessor, but he devoted himself to the task of organizing the affairs of the empire, and better to acquaint himself with the condition of the various provinces he made long and repeated journeys embracing every part of the Roman dominions. Hadrian was succeeded by the philosopher-emperors Antonius Pius (138-161) and Marcus Aurelius Antoninus (161-180), in whom were exhibited the highest and fullest development of the Pagan character, and though the reign of the latter was disturbed by wars against the Parthians and the peoples of the Danube, it was of this age of the Antonines that an eminent historian speaks as the happiest era in the entire course of European history, if the welfare of the great mass of the population be considered.

With the death of Marcus Aurelius the decline of the empire begins. On the north the Germanic peoples were threatening the Roman frontier and on the east the new Persian kingdom arose as a formidable adversary. Commodus (180-192) neglected the affairs of the empire to win the laurels of a gladiator and was murdered by some of his followers. The Prætorian guard now appears as the maker of emperors. It deposed Pertinax who had been chosen by the senate and sold the throne at auction to the Senator Didius Julianus. The armies of the provinces arose and three claimants for the throne appeared. The successful candidate Septimius Severus (193-211), successful by force of arms, ruled well and sought to repress the power of the Prætorians. The reign of his son Caracalla (211-217), one of the most vicious tyrants in Roman imperial history, is noteworthy for the extension of the rights of Roman citizenship to all free inhabitants of the empire. Caracalla was assassinated by the Prætorian prefect Macrinus, who was speedily succeeded by Heliogabulus (218-222), a priest of

the sun at Emesa. Heliogabulus brought with him to Rome the orgiastic rites of the Orient and became the object of national hatred and contempt. He fell at the hands of the Prætorians, who chose as his successor Alexander Severus (222-235) who ruled with fair ability but perished in a mutiny of the German legions. There followed a period of confusion in which the decline of the empire was rapidly accelerated. Maximinus (235-238), a Thracian by birth and a soldier of fortune, crushed his rivals, the two Gordiani, but fell in battle against the forces of the senate. Balbinus and Maximus, chosen by the senate, were slain by the Prætorians, and Gordianus III. ruled from 238 to 244. He was followed by Philip the Arab (244-249), Decius (249-251), Gallus (251-254), Valerianus (254-260) and his colleague Gallienus (254-268). Valerian was defeated by the Persians and taken prisoner and on the ensuing anarchy usurpers arose in every province, known collectively as the Thirty Tyrants. The border lands of the empire suffered from the invasions of the Germanic peoples and the Persians, and a pestilence which raged for 15 years (251-265) carried off one half of the inhabitants of the empire. The fortunes of Rome rose somewhat under the following emperors, Claudius (268-270), Aurelian (270-275) who drove the Goths beyond the Danube and overthrew the Palmyran kingdom of Zenobia, Tacitus (275-276), and Probus (276-282) who held the Rhine against the Germanic tribes. Carus (282-283) perished in a campaign against the Persians and was succeeded by Numerianus (283-284) who died in the following year. The army thereupon proclaimed as emperor Valerius Diocletianus, who after the death of Carinus (283-285) became sole master of the empire.

Diocletian abandoned the ancient forms of government and transformed the empire into an absolute monarchy. He separated the civil and military administrations, created a new order of officials and brought the finances into order. The supreme power he vested in the hands of two Augusti assisted by two Cæsars who in turn were to succeed to the office of Augustus. Thus a more efficient administration would be ensured by the practical division of the empire into four parts. Diocletian, however, did not count on personal ambitions which were destined to wreck his plan. In 305 Diocletian resigned his office and compelled his fellow Augustus, Maximianus, to do likewise. They were succeeded by the Cæsars, Constantius Chlorus and Galerius, while new Cæsars were created. Confusion and civil war followed and at one time there were six Augusti in the field. The struggle finally narrowed down to a contest between Licinius and Constantine, a son of Constantius, and after two wars Licinius was overthrown and Constantine became sole ruler of the empire. Constantine the Great (324-337) continued the administrative policy of Diocletian. He built Constantinople as a new capital for the empire and made Christianity the state religion. Of his three sons to whom he left power, Constantinus, Constantius and Constans, the first died in 340 and the last in 350. Constantius ruled with undisputed power from 353 to his death in 361. He was followed by Julian, known as the Apostate, (361-363), who fell against the Persians, and Jovian (363-64). Valentinian I. ruled from

1. The Muses in the Vatican Museum.
2. Famous statues in the Vatican Museum.

364 to 375. He left the government of the east to his brother Valens and made his son Gratian co-emperor. Gratian ruled till 383 with Valentinian II. as co-emperor. The Goths had now broken into the empire and in 378 they inflicted a terrible defeat upon Valens at Adrianople. In this extreme Gratian conferred the government of the east upon Theodosius (379-395), who by war and diplomacy effected a settlement with the Goths. In 392 Valentinian II. died and Theodosius became sole ruler of the empire. His own death followed in 395, after he had divided the empire between his sons, Honorius, to whom was assigned the West under the guardianship of Stilicho, and Arcadius, who became emperor of the East with Rufinus as his adviser. The influx of Germanic tribes into Italy increased in volume. The tide of invasion was checked for a moment by the generalship of Stilicho (q.v.), but in 410 Rome was sacked by the Goths under Alaric, who, passing into southern Gaul established a kingdom there. Other Germanic hordes wrested Spain from the Roman arms. Honorius died in 423 and was succeeded after a brief interval by Valentinian III. who ruled till 455. The defeat of the Huns under Attila on the Catalaunian Fields in Gaul (451) by Aetius was the last effective assertion of the Roman power. Valentinian III. was murdered in 455 and in the strife for the throne that followed, Valentinian's widow summoned to her aid the Vandals from Africa, who plundered the city of its treasures. For 20 years there came a succession of shadow kings, made and unmade by the all powerful commanders of the German mercenaries, Ricimer, and after him Orestes, who in 475 placed his young son Romulus on the throne. The troops under Odoacer (q.v.) revolted, Orestes was overthrown, the child emperor was retired to private life and in 476 Odoacer assumed for himself the title of king of Italy, thus marking the end of the Roman empire in the West. For the history of the East Roman empire see BYZANTINE EMPIRE.

History of the City of Rome subsequent to 476 A.D.—After the overthrow of the Western Empire and the defeat of Odoacer (see ITALY, *History*) Rome came under the rule of the Ostrogoths. The city suffered severely in the wars between the Goths and Byzantines, in the course of which the city was taken six times. The depredations of the Byzantine emperors as well as of the Christian authorities, who made use of the materials and ornaments of the ancient edifices in the erection of their churches, were the cause of the destruction of many ornaments of the imperial city; but more destructive still were the feuds that afterward (especially in the 10th century and later) raged in Rome between the leading families. In 1084 a part of the Campus Martius, and most of the city in the south, were devastated by the army of Normans, Greeks, and Saracens which Robert Guiscard led to the relief of Gregory VII., then besieged by Henry IV. of Germany in the Castle of Sant' Angelo. In the 14th century the work of destruction and depopulation was hastened by the struggles which resulted from the attempt of Rienzi (q.v.) to found a republic, and was continued during the period of confusion that ensued after the commencement of the great schism in 1378. A terrible pestilence which raged in the city in 1348, is said to have reduced

the number of inhabitants to less than 20,000. A temporary check was given to the confusion that prevailed in Rome toward the end of the 14th century by Boniface IX., but order was not permanently re-established till Martin V. took up his residence in the city after the schism had been virtually terminated by the Council of Constance. Martin's successor, Eugenius IV. (1431-47), is usually named as the pope under whom the work of restoration in Rome began. In this he was followed by Nicholas V. (1447-55), who began the building of the Vatican, Pius II. (Æneas Sylvius, 1458-64), Paul II. (1464-71), who, however, quarried in the Colosseum for the erection of the Palazzo di Venezia, as did also Paul III. (1534-50), when building the Palazzo Farnese. But the most important period in the architectural history of modern Rome was the end of the 15th and beginning of the 16th centuries, when the labors of Bramante, the two Sangalli, Peruzzi, and Michelangelo were pursued under the patronage of Sixtus IV., Alexander VI., Julius II., and Leo X., and when the works of the great architects were adorned in the interior by artists as great or greater, such as Raphael and Michelangelo himself. In 1527 the city was sacked by an imperial army under the Constable of Bourbon. From this date onward the city began to extend more and more over all parts of the Campus Martius. Much was done in the 16th century, especially by Paul III., Pius IV., Gregory XIII., and Sixtus V., for the embellishment and enlargement of the town, the improvement of the streets, and the restoration of the fortifications. Many remains of antiquity were then rescued from destruction, although many more were sacrificed, particularly under Sixtus, for the sake of modern structures. In the 18th century Benedict XIV., Clement XIV. (founder of the Museo Pio-Clementino), and Pius VI. deserve special mention for their efforts to preserve and beautify Rome. In 1798 Rome was occupied by the French, and deprived of many of its art treasures. At the same time a republic was erected in Rome, but this only lasted for a short time, and after a series of disturbances and changes the pope was again reinstated in his dominions in 1799. (See ITALY.) From 1800 to 1814 Rome was once more under French rule, the States of the Church having in the former year been annexed to the Napoleonic empire. The short-lived Roman Republic of 1848-9 was followed by the restoration of the papal rule in 1850. On 20 Sept. 1870, the Italian troops, after effecting a breach in the Porta Pia, in the northeast of the city, marched in along the Via di Porta Pia (henceforth called Via Venti Settembre). Since then Rome has been in the possession of Italy, and since the 1st of July of the following year, the capital of the kingdom.

of Recent Discoveries' (1888); Merivale, 'History of the Romans under the Empire' (1890); Mommsen, 'History of Rome' (1894-5); Montesquieu, 'Considérations sur les Causes de la Grandeur et de la Décadence des Romains' (1734); Niebuhr, 'History of Rome' (1859); Peter, 'Geschichte Roms' (1881).

Rome, N. Y., city in Oneida County; on the Mohawk River, the Erie and the Black River canals, and on the New York C. & H. R., the New York, O. & W., and the Rome, W. & O. R.R.'s. The last mentioned now (1904) belongs to the N. Y. C. & H. R. railroad. The city is about 110 miles west by north of Albany and 16 miles northwest of Utica. It is at the head of the Mohawk Valley, on a plateau about 450 feet above Sea-level. The first settlement was made in 1760 by John Roof. The central part of the city is the site of Fort Stanwix (q.v.), erected here in 1758 at a cost of over \$200,000. It was then a place of great importance as it was the defensive point in the "carrying place," or portage, that part of the route between the Atlantic and the Great Lakes, where the journey had to be made by land. Fort Stanwix was a storm centre in the French war and also in the Revolutionary War. Here in July and August, in 1777, there were many sharp engagements, and finally the Tryon County militia under Herkimer defeated the British under St. Leger in the battle at Oriskany. A government arsenal was established here in 1814, but in 1873 was sold for a factory. In 1819 Rome became a village and in 1870 was chartered as a city.

The greater part of the water supply is taken from the Mohawk River, two miles above Rome, at a place called Ridge Mills. The surrounding country is devoted to farming and dairying; but Rome is a manufacturing city. The chief industrial establishments are brass and copper mills, locomotive works, knitting mills, brick works, canneries, breweries, metal bedstead factories, and creameries. The facilities for transportation give Rome considerable commercial advantages. The prominent public buildings are the Rome State Custodial Asylum for Incurable Insane, the Oneida County Home, the municipal buildings, and some of the business blocks. There are 17 churches and two missions. The educational institutions are the Central New York Institution for Deaf Mutes, Saint Peter's Academy (R. C.), opened in 1865, 10 graded public and parish schools, five public kindergartens, four private schools, and three libraries. The libraries are the high school, the Jervis City Library, and the Y. M. C. A. Library. There are two national banks with a combined capital of \$200,000, and two savings banks. In January 1900, the city debt was \$427,564, largely due to the amounts paid for the city sewerage and for the waterworks. This amount has been considerably lessened. The assessed valuation, in 1903, was nearly \$7,300,000. The government is vested in a mayor and a council of 15 members, who hold office three years. Pop. (1890) 14,991; (1900) 15,343.

A. H. WRIGHT,
'Rome Sentinel.'

Rome, Œcumenical Councils of, are six in number, namely, five Lateran Councils, so called as having been held in the Lateran palace; and the Vatican Council, held in the palace of the Vatican. 1. The ninth General Council of the Church, the first Lateran Council, was held in

the reign of Calixtus II. in 1123; it confirmed the concordat of Worms regarding Investiture (q.v.). 2. The second Lateran (10th general) Council, held in 1139 under Innocent II., condemned the Manichean errors of Arnold of Brescia (q.v.). 3. The third Lateran (11th general) Council, under Alexander III. in 1179, condemned the heresies and impieties of the Waldenses and Albigenes. 4. The 12th general Council (4th Lateran) held in 1215 in the pontificate of Innocent III., confirmed the doctrine of transubstantiation and promulgated decrees for the reformation of abuses in the Church and the extirpation of heresies. 5. The 19th General Council (5th Lateran) under Julius II., assembled in 1511, was in session till 1517 when Leo X. was pope; it enacted some laws for the reformation of clerical discipline, and procured from the king of France, Francis I., the revocation of the Pragmatic Sanction (q.v.) which the French clergy had ever regarded as the bulwark of the Gallican Liberties. 6. The Council of the Vatican (20th œcumenical council), which was opened 8 Dec. 1869 and closed 20 Oct. 1870, under Pius IX., affirmed as the teaching of the Catholic Church the doctrine that the Pope when teaching *ex cathedra* and defining matters of faith or morals is always divinely aided and is infallible.

Rome State Custodial Asylum, an institution for the custody, maintenance and treatment of the custodial class of feeble-minded, located at Rome, N. Y. It was formerly the Oneida County Insane Asylum and Almshouse, but by the acts of the Legislature in 1893 and 1894, the building and grounds were purchased by the state. Among other things, calisthenics, dancing, drilling, kindergarten, sloyd and articulation are taught. Agricultural colonies for the brighter male inmates have also been established.

Feeble-minded are committed to this asylum from all counties in the State, according to the quota assigned each county, which is based on the population of the respective counties, as compared with the capacity of the institution. For their care there are 21 large buildings, beside several small sheds, etc. The average number of inmates is about 700.

Romeo and Juliet, a tragedy by Shakespeare, first published (unauthorized) in 1597. A corrected edition appeared in 1599. The play was written somewhere between 1591 and 1596, and the legend upon which it is founded first appears in a tale printed at Naples in 1476 among the 'Novelle' of Masuccio di Salerno. Luigi da Porta reproduces it in 'La Giulietta' in 1435, and Bandello includes it in his 'Novelle' in 1554. In 1559 a French version of Bandello's 'Novelle' was printed among Pierre Boiastuan's 'Histoires Tragiques.' In 1562 Arthur Brooke printed his English poem 'The Tragical History of Romeus and Juliet,' on which Shakespeare based his drama. In 1562 Boiastuan's French rendering of the tale was translated into English prose by William Painter in his 'Palace of Pleasure,' which Shakespeare consulted likewise. The theme has often been chosen for operatic purposes. Zingarelli's opera, 'Giulietta e Romeo' appearing in 1796; Bellini's 'I Capuletti ed i Montecchi' in 1830; and Gounod's 'Roméo et Juliette' in 1867. A

'dramatic symphony by Berlioz, 'Roméo et Juliette' was composed in 1839.

Römer, rē'mēr, or Roemer, Ole, Danish astronomer: b. Aarhus 25 Sept. 1644; d. Copenhagen 19 Sept. 1710. After study at the University of Copenhagen he was in 1671-81 at Paris, where he made observations in the royal observatory and was elected to the Academy. In 1681 he was made professor of mathematics and director of the observatory at Copenhagen, and subsequently became a councillor of state. He is known chiefly as the discoverer of the finite velocity of light, which he determined by observation of the eclipses of the satellites of Jupiter. He found that when Jupiter and the earth were on opposite sides of the sun, the eclipse seemed to occur too late; when on the same side, too early. The extreme deviation from mean time he computed at 11 minutes; it is now known to be approximately 8 minutes 20 seconds, that is, light crosses the space between the earth and the sun (a little less than 93,000,000 miles) in about 8 minutes. (See LIGHT.) Römer invented the transit instrument (1689) and meridian circle (transit and vertical circle combined; 1690). Consult Grant, 'History of Physical Astronomy' (1852).

Romero, rō-mā'rō, DON Matias, Mexican diplomat: b. Oaxaca, Mexico, 24 Feb. 1837; d. Washington, D. C., 30 Feb. 1898. He was graduated from the Academy of Theoretical and Practical Law, Mexico City, in 1855, and admitted to the bar in 1857. In the revolution of that year he supported the government and served as secretary to Melchor Ocampo. In 1859 he was appointed secretary to the Mexican legation at Washington and in 1860-3 was *chargé d'affaires*. He then returned to Mexico where he was commissioned colonel in the army, became chief of staff to General Diaz, and later in the same year resumed his diplomatic career as minister to the United States. He held the portfolio of the treasurer in Juarez's cabinet in 1868-73, was a member of the senate in 1876 and on the election of Diaz to the presidency he resumed his position in the treasury. He was postmaster-general in 1879-80, and in 1882 he was again sent as minister to the United States, where he arranged the boundary question and concluded a reciprocity treaty. He was reappointed in 1884 and continued in the position until his death. He published more than 50 volumes, chiefly of technical reports, among which are: 'Coffee-culture on the Southern Coast of Chiapas' (1875); 'Correspondence of the Mexican Legation at Washington during the French Intervention' (1870-85); 'The State of Oaxaca'; 'Mexico and the United States.'

Romeyn, rō'min, John Brodhead, American Presbyterian clergyman: b. Marbletown, N. Y., 8 Nov. 1777; d. New York 22 Feb. 1825. He was graduated from Columbia in 1795 and was licensed to preach in 1798. He held charges at Rhinebeck, Schenectady, Albany, and New York successively, attained a high reputation as a theologian and was popular as a preacher. He was one of the founders of Princeton Theological Seminary, president of Transylvania University, a trustee of Princeton College and a moderator in the Presbyterian General Assembly. His sermons were collected and published in 1816.

Romilly, rōm'i-lī, SIR Samuel, English statesman and jurist: b. 1 March 1757; d. London 2 Nov. 1818. He entered Gray's Inn to study for the bar, to which he was called in 1783, and gradually rose to distinction in the court of chancery, in which he ultimately took the lead. During the short administration of Fox and Lord Grenville (1806) he was appointed solicitor-general (being member for Queensborough), and knighted. When the Whigs went out of office he remained in Parliament, where he pleaded the necessity of a revision of the criminal code, with a view to the limitation of capital punishment, and a more appropriate regulation of the scale of penalties. To his exertions may be traced the final determination of the executive to the reform and condensation of the various acts in regard to crime, effected under the superintendence of Sir Robert Peel. Consult: 'Memoirs,' written by himself (1840); also 'The Creevy Papers' (1904).

Romney, rōm'nī, George, English painter: b. Becksides, near Dalton-in-Furness, Lancashire, 15 Dec. 1734; d. Kendal 15 Nov. 1802. His father was a cabinet-maker, and the boy learned this trade, but he also taught himself drawing and carved wood, and at 19 was apprenticed to a portrait-painter at Kendal named Steele. In 1757 he entered on his own career as portrait-painter, and after a certain amount of local success went up to London (1762), leaving his wife (whom he married in 1756) and his two children in Kendal. The following year he won a prize offered by the Society of Art for a historical painting, by his 'Death of General Wolf,' and rose steadily in popularity until he held a position beside Reynolds and Gainsborough as a portrait-painter. He visited France twice; once in 1764 and again in 1790, and resided in Italy during the years 1773-5. While in Italy he gave much attention to the works of Correggio, and this, along with his study of the nude, greatly influenced his after-work. In 1783 Romney made the acquaintance of Emma Hart, who afterward married Sir William Hamilton, and she became the model from which he painted such well known pictures as 'St. Cecilia,' 'Joan of Arc,' 'A Magdalene,' 'A Bacchante,' and 'Sensibility.' His 'Lady Hamilton as Circe' sold in 1890 for \$20,210; his 'Lady Hamilton as Sensibility' in the same year for \$15,025. Gradually he began to withdraw from portrait-painting, and give more time to historical and imaginative work. In 1786 Alderman Boydell founded his famous Shakespeare gallery, to which Romney contributed a scene from the 'Tempest' and the 'Infant Shakespeare attended by the Passions'; while about this time he painted 'Milton and his Daughters,' and 'Newton making Experiments with the Prism.' In order to find room for these great imaginative pictures he erected a large studio at Hampstead, which he occupied in 1797. But his health at this time began to fail, and in the summer of 1799 he returned to Kendal utterly weakened in body and mind. He had only seen his wife twice since he left her 35 years before, yet she received and nursed him faithfully through his premature senility and dotage until his death.

The art of Romney displays a certain fitfulness of achievement due partly to the instability of his character, and partly to his defective early training. His defects of technique are most

apparent in his historical and imaginative subjects; it is only when we examine his portraits, and especially his female portraits, that we find that beauty of form and subtle charm of color which place him among the greatest portrait-painters of the 18th century.

Consult: Hagley, 'Life of George Romney' (1809); Gamlin, 'George Romney and His Art'; Gower, 'Romney and Sir Thomas Laurence'; J. Romney, 'Memoirs of the Life and Writings of George Romney' (1830).

Romney (W. Va.), **Engagements at.** This place was important as an outpost of the Union troops guarding the Baltimore & Ohio Railroad, and also as a base for operations up the valley of the south branch of the Potomac. It was held early in June 1861 by Col. Angus McDonald, with about 500 Virginia troops and two guns. On the night of 12 June Col. Lew Wallace, with 800 men of the 11th Indiana regiment, went by rail from Cumberland to New Creek Station, and marching across the mountains attacked and routed McDonald on the 13th, and on the same day started on his return by the route he had come. Information of Wallace's movement reached Gen. J. E. Johnston, commanding the Confederate forces at Harper's Ferry, on the morning of the 14th, and supposing it to be the advance of Gen. McClellan's column from West Virginia to co-operate with Gen. Patterson, who was threatening to cross the Potomac at Williamsport, Johnston ordered Col. A. P. Hill, with three regiments, to march on Romney and check the movement (see **NEW CREEK**), burned all the bridges on the Potomac from Harper's Ferry to Williamsport, abandoned Harper's Ferry, and fell back to Winchester. On 23 September Lieut.-Col. Cantwell, with detachments of the 4th and 8th Ohio, a company of cavalry, and one gun, marched from New Creek, drove McDonald's forces from Romney on the 24th, and with a loss of three killed and 30 wounded, returned to New Creek, closely followed by McDonald's cavalry. On 25 October Gen. B. F. Kelley, with detachments of Ohio and West Virginia troops and two companies of cavalry, in all about 2,500 men and two guns, started from New Creek for the permanent occupation of Romney. He captured it on the 26th, after a sharp engagement with McDonald's forces, driving them beyond the town on the Winchester road, and capturing all their trains, two guns, 300 stands of arms, and much camp equipage. A supporting column of the 2d Maryland, Col. Johns, marching from the mouth of Patterson's Creek, through Frankfort and Springfield, was met by the 114th Virginia Militia, under Col. A. Monroe, at the bridge over the South Branch, seven miles from Romney, checked, and fell back to Patterson's Creek, with a loss of six or eight in killed and wounded. On 28 October Gen. "Stonewall" Jackson was assigned to the command of the Valley District, with headquarters at Winchester, and immediately prepared to clear the valley of Union troops. He called out the militia, and being reinforced by Gen. Loring's division from West Virginia, set out late in December to destroy the Chesapeake and Ohio canal, and the Baltimore & Ohio Railroad, and to recover Romney. To withdraw his attention from the railroad, Col. Dunning, in command at Romney, made a demonstration toward Winchester with 2,000

infantry and cavalry and six guns. He marched on the night of 6 Jan. 1862, and next morning at Blue's Gap, 16 miles from Romney, fell upon 700 Virginia militia, under Col. Monroe, scattered them and captured two guns, several prisoners, and some baggage, without the loss of a man, and returned to Romney. On the same day Jackson left the vicinity of Hancock and marched for Romney. Hearing of his approach, the Union troops retreated from Romney on the 10th toward New Creek. Jackson occupied the town on the 14th, and placed Loring's division there in winter quarters. Loring and his officers complained to the Richmond authorities, and the Confederate secretary of war ordered Jackson to move the division back to Winchester, which was done 31 January, and on 7 February the town was again occupied by Union troops, under Gen. F. W. Lander. Between this time and the close of the war the town changed hands several times, but for the greater part of the time was in Union possession. Consult 'Official Records,' Vols. II. and V.

E. A. CARMAN.

Romola, rŏm'ŏ-lă, a novel by George Eliot, first published serially in 'The Cornhill Magazine' from July 1862 to July 1863, and issued in book form in 1864. The scene is laid in Florence at the end of the 15th century, and its great figure is Savonarola. The civic struggle between the Medici and the French domination and the religious struggle between Renaissance paganism and ascetic Christianity form the background of the tale. The story proper follows the fortunes of Tito Melema,—a Greek, charming, brilliant, false,—his marriage with Romola of the Florentine house of Bardi, his moral degradation and death. The incidents are many, the local color is rich, but the emphasis of the book is laid on the character of Tito.

Romulus, rŏm'ŭ-lŭs, mythical founder and first king of Rome. He is said to have been the son of Sylvia, generally, but incorrectly, called Rhea Silvia, daughter of Numitor, king of Alba, and one of the priestesses of Vesta. By the god Mars she became the mother of male twins, whom Amulius, who had usurped the throne of Numitor, ordered to be thrown into the Anio, but the basket containing the two boys, Romulus and Remus, was stranded at the foot of the Palatine Hill. Here a she-wolf, going down to the river to drink, was attracted by their cries, carried them to her cave, and suckled them. Some time afterward chance brought thither Faustulus, the king's herdsman, who took them home and educated them. With him Romulus and Remus spent their youth. When they had grown up Amulius was deprived of his usurped throne by Romulus who reinstated his grandfather Numitor in his dominions. After this the brothers resolved to build a city. Romulus wished to place it on the Palatine, Remus on the Aventine, or on another hill three or four miles down the Tiber. Determining to reach a decision by consulting the augurs, each took his station on his favorite hill; the night passed away, and at the first streak of dawn Remus saw six vultures; but at sunrise, when this news was brought to Romulus, 12 vultures flew by him. Each claimed the augury in his favor; but as their companions decided for Romulus his brother was forced to yield. Romulus,

to outline the boundary of the city, yoked a bullock and a heifer to a plow, marked a deep furrow round the base of the Palatine, and guided by this line began to raise the wall. Remus leaped over the rude rampart in scorn, whereupon the enraged Romulus slew him. According to another tradition Remus fled from the anger of his brother beyond the Alps, and founded Rheims. Romulus was immediately struck with remorse, and could obtain no rest till he appeased his brother's shade by instituting the festival of the Lemuria for the souls of the departed. Thus is Rome said to have been founded in the year 753 (or according to others 752 or 751) B.C. The small number of friends who had followed Romulus were insufficient to people his city. Men enough were gained by making the city a refuge for exiles; but the Roman citizens soon wanted women. Romulus thereupon instituted a religious festival, to which he invited the Sabines with their wives and daughters. In the midst of the festival the unarmed strangers were suddenly attacked, and the Sabine women borne away as captives. The two states thus became engaged in war; but the entreaties of the ravished females, who threw themselves between the contending parties, at length effected a peace, and Rome gained by her union with the Sabines an important addition. According to tradition Romulus ascended to heaven into the company of the gods, after he had completed the work of founding the eternal city; and, until the introduction of Christianity, Rome worshipped its founder in temples expressly dedicated to him.

Ronaldshay, rŭn'ald-shā, **North and South**, two of the Orkney Islands (q.v.), Scotland.

Ronayne, rō-nān', **Maurice**, American Roman Catholic clergyman and author: b. Castlemartyr, Ireland, 2 April 1828; d. Fordham, N. Y., 3 March 1903. He received his education for the priesthood in Ireland and France, and entered the Jesuit Order in 1853. He came to the United States in 1855, was ordained to the priesthood in 1856, taught in St. John's College, Fordham, N. Y., and was for many years professor of history in the college of St. Francis Xavier, New York. In 1898 he returned to the college at Fordham, where he spent the remaining years of his life as spiritual director. His writings upon the labor question may be found in various Roman Catholic periodicals. His most important books are: 'Religion and Science' (1879) and 'God Knownable and Known.'

Ron'cador, one of several Californian drum-fishes of the family *Sciaenidae*, especially the red *Sciana saturna*, and *Roncador stearnsi*, both food-fishes of some importance.

Roncesvalles, rŏn-thēs-vāl'yēs (French, RONCEVAUX, rŏns-vō), Spain, a valley in Navarre, between Pampeluna and St. Jean de Port, where, according to tradition, the rear of Charlemagne's army was defeated by the Arabs in 778, and the brave Roland killed. The battle forms an essential part in the fabulous cycilus of Charles the Great or Charlemagne. (See **ROLAND** and **ROMANCE**.) Roncesvalles, the chief place of the valley, 22 miles northeast of Pampeluna, is traversed by the so-called Gates of Roland, leading over the Pyrenees to France; in the church fabulous antiquities bearing the name of Roland

are shown. The French under Moncey defeated the Spaniards here in 1794, and here Soult took up a strong position in 1813, from which he was dislodged by Wellington.

Ron'co, a West Indian name for various drumfish of the genus *Hamulon*, popular among fishermen and in the market, especially *H. bonariense* (ronco prieto) and *H. parra* (ronco blanco) or sailor's choice.

Rondeau, rŏn'dō, or **Rondo**, originally a short lyric of 13 lines divided into three unequal strophes; the two or three first words form the burden, and are repeated after the 8th and 13th line. The term is now chiefly applied to a musical composition, vocal or instrumental, generally consisting of three strains, the first of which closes in the original key, while each of the others is so constructed in point of modulation as to reconduct the ear in an easy and natural manner to the first strain. The rondeau takes its name from the circumstance of the melody going round after both the second and third strain to the first strain, with which it is finally closed. While it frequently forms the last movement of a sonata or a symphony, it is quite as common as a separate composition.

Ronge, Johannes, yō-hān'nēs rŏng'ē, German Anti-Catholic religious leader: b. Bischofswalde, Silesia, 16 Oct. 1813; d. Vienna 26 Oct. 1887. He studied theology at the University of Breslau 1837-9, was ordained to the priesthood in 1840, and in 1841 became chaplain at Grottkau. Having manifested an opposition to the discipline of the church, he was suspended in 1843. On 1 Oct. 1844, he published a letter against the exhibition of the "holy coat" at Treves, which was soon followed by the organization of the so-called German Catholic congregations. (See **GERMAN CATHOLICS**.) He published in succession a number of pamphlets, in which he called on the Roman Catholic laity and the lower clergy to leave the communion of that church. These were generally understood to be written from the standpoint of deism; and in subsequent years Ronge pronounced himself more and more unreservedly in favor of deistic doctrines. He took part with the radicals in 1848, and was obliged to flee to London, where he signed in 1851, with Ruge, Struve, Kinkel, and others, a democratic manifesto to the German people, and where he became the leader of a free congregation. In consequence of the amnesty granted by the Prussian government, he in 1861 again made his appearance in Breslau. He founded a reform association at Frankfort-on-the-Main in 1863, and from 1873 resided at Darmstadt. Consult the article 'Deutschkatholiken' in Wetzzer und Welte's 'Kirchenlexikon.'

Ronsard, Pierre de, pē-ār dē rŏn-sār, French poet: b. Chateau de la Poissonnière, Vendômois, 11 Sept. 1524; d. St. Cosme near Tours, 27 Dec. 1585. He entered as page the service of the dauphin, and then of the Duc d'Orléans, 2d son of the king. In 1538 he accompanied James V. of Scotland and his bride Marie de Lorraine back to their kingdom, and remained at the Scottish court three years. He also spent six months at the English court, and was then employed in a diplomatic capacity in Germany, Piedmont, Flanders, and Scotland.

On his return to France he devoted himself with great eagerness to the study of literature. With a group of followers, self-styled the "Pleiade," he cast away the literary traditions and ideals of mediæval France, and sought inspiration from the Latin and Greek classics. The result was transformatory, and Ronsard's influence on the progress of French letters was thus very great. In the Floral Games at Toulouse he triumphed over his competitors, and received a silver statue of Minerva, which he presented to Henry II. He was greatly esteemed by that prince, and by his successors, Francis II. and Charles IX.; obtained the abbey of Bellozane, and was also prior of St. Cosme. His writings, consisting of sonnets, madrigals, eclogues, lyric pieces, elegies, and satires, and a fragment of an epic poem, 'La Franciade,' were read with almost incredible admiration by his contemporaries, and brought him valuable presents from Queen Elizabeth of England and the imprisoned Queen of Scots. Many of his sonnets and odes possess considerable merit, but his style is marred by affectation, and his pages are filled with freshly imported words from the classic languages. There are editions by Blanchemain (1856-67) and Marty-Laveaux (1887 et seq.).

Rood, Ogden Nicholas, American physicist: b. Danbury, Conn., 3 Feb. 1831; d. New York 12 Nov. 1902. He was graduated from Princeton in 1852 and afterward studied at Yale and at the universities of Munich and Berlin. He was appointed to the chair of physics and chemistry at the University of Troy in 1858, and in 1863 accepted the chair of physics at Columbia where he remained until his death. In his researches and experimental work he showed great originality and skill, his specialties being in the fields of mechanics, optics, acoustics, and electricity. His original experiments included the application of stereoscopic photography to the microscope, the quantitative analysis in color contrast, the measurement of the duration of flashes of lightning, and he was the first to describe a photometric method that is independent of color. He was a leading member of the prominent scientific societies, author of nearly 100 monographs and also wrote: 'Modern Chromatics' (1881); 'The Voice and the Ear'; etc.

Rood, a cross. The term is more particularly applied to the large cross erected in Roman Catholic churches over the entrance of the chapel or choir; this is often of a very large size, says the 'Glossary of Architecture,' and when complete is like other crucifixes, accompanied by the figures of Saint John and the Blessed Virgin, placed one on each side of the foot of the cross; but these are more often omitted. The rood loft was the gallery in which the cross was set to view, and the rood-arch was the arch between the nave and the chancel, that is, the arch over the rood-loft. Rood-lofts became common in England in the 14th century, were ordered taken down by the government in the 15th and 16th centuries, and temporarily were restored under Queen Mary. See the Irish Constitution of 1635, p. 110.

Rood. See WEIGHTS AND MEASURES.

Rood-screen, a screen of wood, stone, or wrought iron, separating the western end of the ritual choir from the nave in many churches, and forming a support for the rood, a cross or cru-

cifix, placed in the centre of the rood-beam. Sometimes the rood-screen was double with vaulting between and a rood-loft over it, as at Southwell Cathedral. It was frequently ornamented with niches in which were placed statues, as at York Minster and Rochester Cathedral.

Roof, the covering of a building by which the interior secures protection. In ordinary acceptance the term includes the covering and the supporting framework, though in carpentry the term is applied only to the framework. Roofs are broadly distinguished as flat or sloping. The former were used almost exclusively among ancient peoples and are at present employed largely in Eastern countries where the roof is

FIG. 1.

devoted to some extent to domestic purposes. The sloping roof, being to a great extent an ornamental consideration, has given way to the flat roof in modern business buildings, where economy of construction prevails. Flat roofs are usually covered with tar, metal, asphalt or gravel. The framework of the roof has, until the modern application of iron to this use, been almost exclusively of timber; and the end desired has been to arrange the timbers in such relations as to secure the greatest strength and stiffness consistent with the minimum of weight; also to avoid lateral strain or thrust upon the walls. The form chosen has been that of two or more inclined planes for the slopes of the roof over the enclosed space. Two inclined planes are formed by a series of sloping rafters having the lower ends tied together to prevent spreading. The upper ends forming the angle of the roof and connected by the ridge-piece. The method of tying the rafters is by a horizontal beam laid across the span, receiving at each end the foot of one of the rafters, the two being securely mortised. This is called a tie-beam. When the roof is of wide span it becomes necessary to secure the tie-beam against settling in the middle, and this is done by joining the centre of the tie-beam and the ridge angle of the rafters by a king-post (A in Fig. 1).

Sometimes two vertical beams are suspended from the rafters to the tie-beam, and these are called queen-posts (BB in Fig. 2).

FIG. 2.

Braces or struts (c) may be carried from the foot of the suspended posts to the rafters to afford additional stiffness to the frame. Further support is given to the rafters in roofs of long span by one or a series of transverse

ROOFING TILES—ROON

longitudinal beams called purlins. Early Christian basilicas, of which San Miniato in Florence is typical, had roofs of the character just described. When the period of Gothic architecture was reached the king-post and tie-beam was carved and molded, in cases where wooden roofs were used instead of stone vaulting. Open timber roofs were used in England more than on the Continent for churches and halls. The finest example is that of Westminster Hall (Fig. 3) completed in 1399 and having a span of 68 feet.

FIG. 3.

In this example the central part of the tie-beam is cut away, and the great rigidity of the framework prevents any inordinate thrust upon the walls.

The inclination or pitch of the roof seems to be regulated by taste, after the general law is observed that countries of moist climate require a sloping roof to carry off the rain and snow. The slope of a Greek pediment, marking that of the roof, varied from 15° to $16\frac{1}{2}^{\circ}$; Roman roofs, the roofs of Romanesque buildings, and also those of the Renaissance era, generally carried an inclination increased one quarter to that of Greek buildings. The Gothic pitch sometimes reached to 50° or 60° . But since the period of the prevalence of one particular style, great latitude has been observed, Germany and the Netherlands favoring a steep roof, and France retaining a moderately steep inclination even in her Renaissance structures; but England has tended toward the lowering of the pitch.

The commonest form is the gable roof where each end terminates in a gable. Modifications of this are the curb-roof in which the slope is broken; further distinguished as the gambrel roof where only two opposite sides are sloping; the French roof where the slope beneath the curb approaches almost to verticality and that above is nearly flat or with a slightly visible slope; the Mansard roof, named after its designer, Mansard, where the slope beneath the curb is pierced by dormer windows. The hipped roof is one having a double pitch and no gables, and the ridge shorter than the parallel wall plates. The pyramidal roof is one where the ridge is so short as to approach a point. Various

modifications of these general forms are known by a variety of names.

The recent use of iron for roof-frames has become very general, especially where wide spans are required as in the case of railway train sheds. The general principles of construction employed in wooden frames are utilized in iron ridge roofs; but for oval or conical roofs, the iron trusses require a consideration of the principles governing those of bridge trusses. See BRIDGES.

The covering of sloping roofs is of various material, such as thin slabs of stone, thatch, tiles, slate, metal, shingles and cement.

Roofing Tiles. See TILES.

Rook, a European crow (*Corvus frugilegus*), having the base of the bill, forehead and upper part of the throat naked. The rook possesses a voice much less harsh than that of the crow. Rooks are gregarious in habits, and nest in great communities or rookeries, thus differing from other species of the family. The nests, which are placed in tree tops, are built or repaired early in March, and the young are hatched in April. The food consists chiefly of grubs, although grain appears to form part of the dietary. In Great Britain the rook is a permanent resident or partial migrant, but in other parts of Europe these birds appear to be more or less strictly migratory. The same species is found in Asia, where related species having the facial feathers only partially deciduous also occur.

Rooke, rûk, **SIR GEORGE**, English admiral: b. 1650; d. 24 Jan. 1708-9. At an early age he entered the royal navy, and in 1694 became one of the lords commissioners of the admiralty and admiral. He distinguished himself in the fight against the French and Spanish fleets in Vigo Bay (1702), and at the capture of Gibraltar in July 1704. On 9 Aug. 1704 he fell in with a French fleet of much superior force, under the Comte de Toulouse, off Malaga, and an engagement, which lasted nearly the whole day, ensued. Victory remained with the English, though none of the French ships were captured. The news of the Malaga victory reached England during the celebration over Blenheim, and Rooke's name was put forward for honors along with Marlborough's; but being a Tory he suffered from the jealousies of the Whigs, the dominant power. His command was taken away from him and he retired in disgust to his family seat in Kent.

Rookwood Pottery. See POTTERY.

Roon, rôn, **ALBRECHT THEODOR EMIL VON**, Prussian soldier: b. Pleushagen 30 April 1803; d. Berlin 23 Feb. 1879. He entered the army in 1821; was attached to the Topographical Bureau in Berlin, 1833-5; became captain in 1836, and major in 1842; in 1848 became chief of staff of the 8th army corps at Coblenz, took part in the campaign at Baden of that year; and was promoted lieutenant-general in 1859. In the latter year he was appointed a member of a commission on the reorganization of the army. He had given special attention to this subject for many years, but his proposals which were in effect an extension with modifications of Scharnhorst's system, embracing a universal three years' service and a reserve were carried only after long opposition. The Austrian war of 1866 demonstrated that value of his sys-

tem. He attended the German emperor throughout the Franco-Prussian war, and was created a count in 1871. The ministry of war which he had held since 1859 he resigned in 1871 together with the ministry of marine, held since 1861. In 1872 he succeeded Bismarck as president of the Prussian cabinet and was made field-marshal shortly after; but soon resigned. He was the author of several works on geography published between 1832 and 1839. Consult: 'Denkwürdigkeiten aus dem Leben des Generalfeld-marschalls Kriegsministers Grafen Roon, Sammlung von Briefen, Schriftstücken und Erinnerungen' (1892); 'Kriegsminister von Roon als Redner politisch und militärisch erläutert' (1895).

Roos, Johann Heinrich, yō'hān hīn'rīh rōs, German painter: b. Otterberg, in the Palatinate, 27 Oct. 1631; d. Frankfort-on-Main 3 Oct. 1685. He came as a boy to Amsterdam and applied himself, under the teaching of Juliaen Dujardin and B. Graat, to landscape and animal painting. After a visit to Italy he settled finally at Frankfort. Most of his landscapes are in the conventional Italian style, and filled with craggy rocks, ruins, shepherds and flocks. The galleries of Vienna, Berlin, Munich and Dresden contain examples of this artist, who executed some admirable etchings. He was the head of an artistic family; his younger brother, his own sons, and a son of his nephew, all being artists of some repute during their time.

Roo'sa, Daniel Bennett Saint John, American ophthalmologist: b. Bethel, N. Y., 4 April 1838. He was graduated from the University of New York in 1860, served as assistant surgeon among the first troops called out by President Lincoln in 1861 and became resident surgeon at the New York Hospital in 1862. He studied in Europe in 1863 and in the following year began practice in New York, making a specialty of ophthalmology and otology. From 1863-82 he was professor of diseases of the eye and ear at the University of New York, occupied the same chair at the University of Vermont in 1875-80, afterward accepting a like office at the New York Post-Graduate Medical School where he is also president. He was one of the founders of the Manhattan Eye and Ear Hospital and is connected with the leading scientific societies. He has published: 'A Doctor's Suggestions' (1880); 'The Old Hospital and Other Papers' (1886); 'Treatise on the Ear' (1891); 'Defective Eyesight' (1899); etc. In March 1904 the 21st anniversary of his founding of the New York Post-Graduate School was observed by a dinner given in his honor by a large number of prominent physicians.

Roosevelt, rō'zē-vēlt, Nicholas J., American inventor: b. New York 27 Dec. 1767; d. Skaneateles, N. Y., 30 July 1854. He engaged in manufacturing and inventing in New York and was connected with Robert R. Livingston and John Stevens in experimental boat-building. In 1798 he conceived the idea of a vertical wheel, a suggestion which made steam navigation a success. The first experiment was made in a boat launched in 1802 and propelled by the vertical wheels. In 1809 he was associated with Fulton in the introduction of steamboats into western waters and in 1811 built and launched the New Orleans with which he made a pioneer

trip down the Ohio and Mississippi rivers in 14 days. He obtained letters patent from the United States government in 1814 protecting his invention, but was denied protection by the New Jersey legislature. Fulton never claimed the invention as his own, but Roosevelt's title to it has never been legally proved.

Roosevelt, Robert Barnwell, American author and politician: b. New York 7 Aug. 1829; d. Sayville, L. I., 14 June 1906. He was admitted to the bar and practised law in New York until 1871, when he was elected to Congress. In 1888 he was appointed minister to the Netherlands and served two years. His most important public service, however, was in the establishment of the United States Fish Commission, of which measure he was the originator and promoter while in Congress, and in the interest aroused by him generally in the preservation of American game and American forests. His writings include: 'Game Fish of North America' (1862); 'Game Birds of America' (1866); 'Florida and the Game Water Birds' (1868); and 'Five Acres Too Much' (1869). He was the uncle of President Roosevelt.

Roosevelt, Theodore, American politician and author, 26th President of the United States: b. New York 27 Oct. 1858. He was educated privately and at Harvard, from which he was graduated in 1880; then for a year traveled in Europe, which he later at intervals revisited; and in 1881 published his first book, 'The Naval War of 1812,' characterized, like his subsequent works by creditable research, general accuracy, and vigorous statement. He came into politics as a champion of civil-service principles. In the autumn of 1881 he was elected to the State assembly of New York from the 21st district, and he served in that body continuously until 1884. He introduced into the assembly the first civil-service bill, passed in 1883. In 1884 he was chairman of the New York delegation to the national Republican convention. He was nominated in 1886 as an independent candidate for the New York mayoralty, but, though he received Republican endorsement, was defeated by Abram S. Hewitt (q.v.), candidate of the United Democracy, who was elected by about 22,000 plurality. In May 1889 he was made by President Harrison a member of the United States civil-service commission, in which post he continued until May 1895. During this six years' incumbency he strictly endeavored to apply the test of merit to all executive positions, with the result that the commission assumed a position of importance it has never since lost, and civil-service law gained a new vitality. At the beginning of his term of service, 14,000, at its close, 40,000, employees held their positions under the rules of the civil-service. From the civil-service commission he resigned to become president of the board of New York police commissioners during the administration of Mayor Strong. At once he undertook the task of thorough reorganization. Among the principles insisted on by him was an impartial application of the civil-service idea to appointments to the police force and promotions in it. By his rigorous enforcement of laws and ordinances he gave unwonted effectiveness to the office. This post he relinquished in 1897 to become assistant-secretary of the navy to Secretary John D. Long

Photo. by Rockwood

THEODORE ROOSEVELT,
TWENTY-SIXTH PRESIDENT OF THE UNITED STATES.

(q.v.), in the first administration of President McKinley. Quickly acquiring the extensive detailed knowledge necessary to his post, he began to urge that preparation of the navy for warfare which contributed so signally to the triumph of American arms in the Spanish-American war. He called for two appropriations of respectively \$800,000 and \$500,000, for ammunition for naval target practice; and though this was at the time deemed extravagant, it was later amply justified by the skill of American gunners as shown at Manila and Santiago. On 6 May 1898 he resigned his assistant-secretaryship to enter the army. His experience in 1884-8 in the 8th regiment N. Y. N. G., in which he had for a time served as captain, furnished some basis for his military career. He joined Leonard Wood (q.v.), captain and surgeon, U. S. A. (now major-general, U. S. A.), in recruiting the 1st United States volunteer cavalry, of which he became lieutenant-colonel, with Wood as colonel. Notwithstanding he was second in command, his regiment, composed to a large extent of cowboys and western hunters, was popularly known as "Roosevelt's Rough Riders." On 1 July 1898 he led the victorious charge of the "Rough Riders" and the 9th cavalry up San Juan hill, on 11 July was promoted colonel, and in September was mustered out. On 27 September he was nominated as Republican candidate for the governorship of New York, obtaining 753 ballots to 218 for Governor F. S. Black (q.v.). He entered on an active campaign, visiting nearly every portion of the State; won the support of many independent Republicans and Democrats; and was elected by a plurality of 18,079 over his Democratic opponent, Judge Augustus Van Wyck (q.v.). He at first declined to sanction the use of his name in connection with the vice-presidency in McKinley's second campaign, but ultimately yielded, and was nominated by acclamation at the national Republican convention at Philadelphia 21 June 1900. He immediately set out on an aggressive speaking tour, extending to the Far West; and it is believed that he thus had large influence in the success of his ticket. The assassination of President McKinley placed him in the Presidential chair. On 14 Sept. 1901 the oath of office was administered by United States District Judge John R. Hazel. Upon his accession he announced that he would unbrokenly continue the policy of McKinley, whose cabinet he retained. In November 1904 he was elected for the full term by a plurality of over 2,000,000 votes, the largest plurality ever given any Presidential candidate. For the events of his administration see UNITED STATES, *History*. During his political life his pen has been constantly busy. He has written: 'Hunting Trips of a Ranchman' (1883); a 'Life of T. H. Benton' (1886); a 'Life of Gouverneur Morris' (1887); 'Ranch Life and the Hunting Trail' (1888); a 'History of the City of New York' (1890); 'Essays on Practical Politics' (1892); 'The Wilderness Hunter' (1893); 'The Winning of the West' (1889-96); 'American Ideals' (1897); 'The Rough Riders' (1899); a 'Life of Oliver Cromwell' (1900); 'The Strenuous Life' (1900); 'California Addresses' (1903); 'Maxims of Theodore Roosevelt' (1903); 'Addresses and Presidential Messages' (1904). His works appeared in 8 vols. in 1902. He wrote also in 'Hero-Tales from American History' (1895;

with H. C. Lodge); and 'The Deer Family' (1902; with several others). The best of his books is 'The Winning of the West,' the narrative of the conquest of United States territory west of the Alleghenies, which takes good rank among authoritative works on United States history. Consult: Clemens, 'Theodore Roosevelt, the American' (1901); Leupp, 'Roosevelt, the Man' (1904); Baker, 'A Character Sketch' (McClure's, vol. 12, 1898); Bigelow, 'President Roosevelt' ('Contemporary Review,' vol. 80, 1901); Rod, 'Le Président Roosevelt d'après son Œuvre Littéraire' ('Correspondant,' vol. 205, 1901); 'North Am. Rev.,' 'President Roosevelt's First Year in Office' (vol. 175, 1902); Guerlac, 'M. Roosevelt, Orateur' (Révue Politique et Littéraire, ser. 4, vol. 29, 1903); Brooks, 'President Roosevelt' ('Fortnightly Review,' vol. 81, 1904); Riis, 'Theodore Roosevelt, the Citizen' (1904).

Root, root or rüt, Elihu, American lawyer and statesman: b. Clinton, N. Y., 15 Feb. 1845. He was graduated from Hamilton College in 1864, and from the New York University Law School in 1867. In the latter year he was admitted to the bar and entered upon the practice of his profession in New York. In 1883 he was appointed United States District Attorney for the southern district of New York; in 1894 was a delegate-at-large to the New York State Constitutional Convention, and was chairman of the judiciary committee. He was appointed secretary of war by President McKinley in 1899 and reappointed in 1901. Though his marked ability as a lawyer was recognized by his colleagues, he was but little known outside New York State at the time of his appointment to the War Department, and the choice excited considerable surprise. He found the work of his department in disorder with constant rivalry among its various bureaus, but by strict discipline, adherence to civil-service rules, and establishing a system of promotion for merit, he soon brought order into the administrative departments, and turned his attention to the organization of the army. In this field he brought about a number of improvements, chief among which are the assimilation of the militia with the regular army and the creation of the General Staff. (See MILITIA and GENERAL STAFF of the ARMY.) He also had charge of the military administration of Cuba and the Philippines; and while he was severely criticised for not trying to prevent cruelties in the conquest of the Philippines, he must also be given credit for the policy of the army in enforcing sanitary measures, and preparing for independent government in Cuba; and for the restoration of order and preparation for civil government and the work of the Philippine Commission in the Philippines. In January 1904 he retired from the secretaryship to resume the practice of law. On 19 July 1905 he was appointed Secretary of State.

Root, George Frederick, American musician and song-writer; b. Sheffield, Mass., 30 Aug. 1820; d. Bailey's Island, Maine, 6 Aug. 1895. He removed to New York where he taught in 1844-50, studied in Paris for a time in 1850, and in 1859 went to Chicago where he became a member of the music-publishing firm of Root and Cady. He was the originator of normal musical institutes and did much to im-

prove the standard of music in this country, founding a school of distinctively American music. His song 'The Battle-Cry of Freedom' (1861) gained immediate popularity and at one time 14 printing-presses were engaged in printing it. 'Tramp, Tramp, Tramp, the Boys are Marching' (1864), though written so nearly at the close of the war, nevertheless gained a wide sale. In a catalogue of 114 war songs 36 were from his pen. Among his songs are; 'Hazel Dell' (1853); 'Rosalie, the Prairie Flower' (1855); 'Just Before the Battle, Mother' (1863); 'Old Potomac Shore'; etc. He also wrote the quartet 'There's Music in the Air' and the cantatas 'The Flower Queen' (1852) and 'The Haymakers' (1857).

Root, that part of a plant which, normally, penetrates the soil, absorbs water and chemicals in solution, for nutritive purposes, forces it through the plant, and also acts as an anchor and support. Roots, however, may also, in modified forms, draw nutriment from other vegetation, or from the air, and may even serve as support and aid to climbing-plants. Low forms of vegetation, and certain submerged aquatics able to absorb water through most of their tissues, have no roots, or only enough to act as anchors.

The primary form of root is that which, starting from the germinating seed, secures it to the ground, and strikes downward into the soil, sending off horizontal branches which in turn branch, until the ground occupied by the fibrous reticulation is thoroughly exhausted of food. In many cases, however, this single central tap-root, so-called, is missing, and numerous horizontal and lateral roots take its place. The growth of the root-system is commensurate with that of the plant above ground. In epiphytes, the roots either adhere to the site of the plant, to hold it in place, or depend freely in the air, drawing nourishment therefrom.

Plants are called annuals, biennials or perennials, according to the length of time the root lives, but the differences are not always absolute, and are often changed by cultivation. Biennials and perennials, especially the former, are apt to have thickened, tuber-like roots, in which nourishment is stored during the growing periods, to be drawn upon when the plant flowers, as in beets and carrots.

Each root is a naked organ, incapable of bearing leaves, which has a blunt apex shielded by a root-"cap" more or less distinct, of old and firm cells. The growing cells of the root lie directly behind this cap, and still further back is a zone of delicate tubular root-hairs, which are devoted to the absorption of liquid foods from the soil, and are constantly dying off and being renewed on the side next the root-cap. The growing tip with cap and root-hairs, continually pushes forward into the soil, while the older portions become inactive so far as absorption is concerned, thicken, envelop themselves in cork, and increase their means of conducting water from the region of the root-hairs to the rest of the plant.

Roots may be produced from stem-nodes, branches, or even leaves (as in begonia), and are then called adventitious. A familiar example of this is found in the aerial roots of banyan and mangrove, which start from the branches

and eventually penetrate the ground, and which not only assist in feeding the trees, but also help to support their gigantic heads. Vines, such as the poison-ivy, have masses of aerial rootlets springing from the stem and fastening it firmly to its support.

The haustoria of certain parasitic plants are a form of reduced roots, and are special organs of absorption which "arise from the internal tissues of the parasite, and possess, in a marked degree, the capability of penetrating to a considerable depth into the body of the host plant by means of solvent ferments and the pressure resulting from their own growth." Once there, they draw sustenance from their host, and often dispense with assimilative organs of their own.

Other parasites have disk-like haustoria upon their root-systems, which fasten upon the roots of other plants, and, although appearing above ground like self-supporting herbs with green foliage, vigorously assimilative, these plants do not reach full development without this clandestine connection. The young roots of saprophytes, or plants living upon the decaying remains of vegetation, seem to require the co-operation of fungi in obtaining food.

The connection of bacteria and leguminous plants is becoming well known. The bacteria penetrate through the root-hairs of the *Leguminosa*, into the cortex of the root and there raise tubercular growths while living on the carbohydrates furnished by the host. But these bacteria, capable of fixing free nitrogen, furnish the host plant with a steady supply of nitrogenous food. The tubercles are most numerous on legumes growing in poor soil, and by plowing the legumes under the ground they decay, returning the nitrogen to the soil in a form available for the next crop. This process is called green manuring, and is a good treatment for exhausted, non-nitrogenous soils.

Root, in philology. See SCIENCE OF LANGUAGE.

Root and Branch Men, in British politics, a party in the House of Commons and out of it who supported a petition signed by 15,000 London citizens, praying that episcopacy might be destroyed "root and branch." Nathaniel Fiennes, Sir Harry Vane, and Hampden were of the party. A bill to give effect to the petition was read a first and second time in 1641, but was ultimately dropped.
